**6.2.2.5.4.7** An application for a subsequent design type approval shall meet the requirements of 6.2.2.5.4.8 and 6.2.2.5.4.9, provided a manufacturer is in the possession of an initial design type approval. In such a case, the manufacturer's quality system according to 6.2.2.5.3 shall have been approved during the initial design type approval and shall be applicable for the new design.

**6.2.2.5.4.8** The application shall include:

- (a) The name and address of the manufacturer and in addition, if the application is submitted by an authorised representative, its name and address;
- (b) Details of any refusal of approval of a similar application by any other competent authority;
- (c) Evidence that initial design type approval has been granted; and
- (d) The technical documentation, as described in 6.2.2.5.4.3 (h).

**Procedure for design type approval**

**6.2.2.5.4.9** The inspection body shall:

- (a) Examine the technical documentation to verify that:
  - (i) the design is in accordance with the relevant provisions of the standard, and
  - (ii) the prototype lot has been manufactured in conformity with the technical documentation and is representative of the design;
- (b) Verify that the production inspections have been carried out as required in accordance with 6.2.2.5.5;
- (c) Select pressure receptacles from a prototype production lot and supervise the tests of these pressure receptacles as required for design type approval;
- (d) Perform or have performed the examinations and tests specified in the pressure receptacle standard to determine that:
  - (i) the standard has been applied and fulfilled, and
  - (ii) the procedures adopted by the manufacturer meet the requirements of the standard; and
- (e) Ensure that the various type approval examinations and tests are correctly and competently carried out.

After prototype testing has been carried out with satisfactory results and all applicable requirements of 6.2.2.5.4 have been satisfied, a design type approval certificate shall be issued, which shall include the name and address of the manufacturer, results and conclusions of the examination, and the necessary data for identification of the design type.

If the manufacturer is denied a design type approval, the competent authority shall provide written detailed reasons for such denial.

**6.2.2.5.4.10** Modifications to approved design types

The manufacturer shall either:

- (a) Inform the issuing competent authority of modifications to the approved design type, where such modifications do not constitute a new design, as specified in the pressure receptacle standard; or
- (b) Request a subsequent design type approval where such modifications constitute a new design according to the relevant pressure receptacle standard. This additional approval shall be given in the form of an amendment to the original design type approval certificate.

**6.2.2.5.4.11** Upon request, the competent authority shall communicate to any other competent authority, information concerning design type approval, modifications of approvals and withdrawn approvals.

**6.2.2.5.5 Production inspection and certification****General requirements**

An inspection body, or its delegate, shall carry out the inspection and certification of each pressure receptacle. The inspection body selected by the manufacturer for inspection and testing during production may be different from the inspection body used for the design type approval testing.

Where it can be demonstrated to the satisfaction of the inspection body that the manufacturer has trained competent inspectors, independent of the manufacturing operations, inspection may be performed by those inspectors. In such a case, the manufacturer shall maintain training records of the inspectors.

The inspection body shall verify that the inspections by the manufacturer, and tests performed on those pressure receptacles, fully conform to the standard and the requirements of RID. Should non-conformance in conjunction with this inspection and testing be determined, the permission to have inspection performed by the manufacturer's inspectors may be withdrawn.

The manufacturer shall, after approval by the inspection body, make a declaration of conformity with the certified design type. The application of the pressure receptacle certification marking shall be considered a declaration that the pressure receptacle complies with the applicable pressure receptacle standards and the requirements of this conformity assessment system and RID. The inspection body shall affix or delegate the manufacturer to affix the pressure receptacle certification marking and the registered mark of the inspection body to each approved pressure receptacle.

A certificate of compliance, signed by the inspection body and the manufacturer, shall be issued before the pressure receptacles are filled.

#### **6.2.2.5.6 Records**

Design type approval and certificate of compliance records shall be retained by the manufacturer and the inspection body for not less than 20 years.

### **6.2.2.6 Approval system for periodic inspection and test of pressure receptacles**

#### **6.2.2.6.1 Definition**

For the purposes of this section:

*Approval system* means a system for competent authority approval of a body performing periodic inspection and test of pressure receptacles (hereinafter referred to as "periodic inspection and test body"), including approval of that body's quality system.

#### **6.2.2.6.2 General requirements**

##### **Competent authority**

- 6.2.2.6.2.1** The competent authority shall establish an approval system for the purpose of ensuring that the periodic inspection and test of pressure receptacles conform to the requirements of RID. In instances where the competent authority that approves a body performing periodic inspection and test of a pressure receptacle is not the competent authority of the country approving the manufacture of the pressure receptacle, the marks of the approval country of periodic inspection and test shall be indicated in the pressure receptacle marking (see 6.2.2.7).

The competent authority of the country of approval for the periodic inspection and test shall supply, upon request, evidence demonstrating compliance to this approval system including the records of the periodic inspection and test to its counterpart in a country of use.

The competent authority of the country of approval may terminate the approval certificate referred to in 6.2.2.6.4.1, upon evidence demonstrating non-compliance with the approval system.

- 6.2.2.6.2.2** The competent authority may delegate its functions in this approval system, in whole or in part.

- 6.2.2.6.2.3** The competent authority shall ensure that a current list of approved periodic inspection and test bodies and their identity marks is available.

##### **Periodic inspection and test body**

- 6.2.2.6.2.4** The periodic inspection and test body shall be approved by the competent authority and shall:
- (a) Have a staff with an organisational structure, capable, trained, competent, and skilled, to satisfactorily perform its technical functions;
  - (b) Have access to suitable and adequate facilities and equipment;
  - (c) Operate in an impartial manner and be free from any influence which could prevent it from doing so;
  - (d) Ensure commercial confidentiality;
  - (e) Maintain clear demarcation between actual periodic inspection and test body functions and unrelated functions;
  - (f) Operate a documented quality system accordance with 6.2.2.6.3;
  - (g) Apply for approval in accordance with 6.2.2.6.4;
  - (h) Ensure that the periodic inspections and tests are performed in accordance with 6.2.2.6.5; and
  - (i) Maintain an effective and appropriate report and record system in accordance with 6.2.2.6.6.

#### **6.2.2.6.3 Quality system and audit of the periodic inspection and test body**

##### **6.2.2.6.3.1 Quality system**

The quality system shall contain all the elements, requirements, and provisions adopted by the periodic inspection and test body. It shall be documented in a systematic and orderly manner in the form of written policies, procedures, and instructions.

The quality system shall include:

- (a) A description of the organisational structure and responsibilities;
- (b) The relevant inspection and test, quality control, quality assurance, and process operation instructions that will be used;
- (c) Quality records, such as inspection reports, test data, calibration data and certificates;
- (d) Management reviews to ensure the effective operation of the quality system arising from the audits performed in accordance with 6.2.2.6.3.2;
- (e) A process for control of documents and their revision;
- (f) A means for control of non-conforming pressure receptacles; and
- (g) Training programmes and qualification procedures for relevant personnel.

#### **6.2.2.6.3.2 Audit**

The periodic inspection and test body and its quality system shall be audited in order to determine whether it meets the requirements of RID to the satisfaction of the competent authority.

An audit shall be conducted as part of the initial approval process (see 6.2.2.6.4.3). An audit may be required as part of the process to modify an approval (see 6.2.2.6.4.6).

Periodic audits shall be conducted, to the satisfaction of the competent authority, to ensure that the periodic inspection and test body continues to meet the requirements of RID.

The periodic inspection and test body shall be notified of the results of any audit. The notification shall contain the conclusions of the audit and any corrective actions required.

#### **6.2.2.6.3.3 Maintenance of the quality system**

The periodic inspection and test body shall maintain the quality system as approved in order that it remains adequate and efficient.

The periodic inspection and test body shall notify the competent authority that approved the quality system, of any intended changes, in accordance with the process for modification of an approval in 6.2.2.6.4.6.

#### **6.2.2.6.4 Approval process for periodic inspection and test bodies**

##### **Initial approval**

- 6.2.2.6.4.1** A body desiring to perform periodic inspection and test of pressure receptacles in accordance with a pressure receptacle standard and RID shall apply for, obtain, and retain an approval certificate issued by the competent authority.

This written approval shall, on request, be submitted to the competent authority of a country of use.

- 6.2.2.6.4.2** An application shall be made for each periodic inspection and test body and shall include:

- (a) The name and address of the periodic inspection and test body and, if the application is submitted by an authorised representative, its name and address;
- (b) The address of each facility performing periodic inspection and test;
- (c) The name and title of the person(s) responsible for the quality system;
- (d) The designation of the pressure receptacles, the periodic inspection and test methods, and the relevant pressure receptacle standards met by the quality system;
- (e) Documentation on each facility, the equipment, and the quality system as specified under 6.2.2.6.3.1;
- (f) The qualifications and training records of the periodic inspection and test personnel; and
- (g) Details of any refusal of approval of a similar application by any other competent authority.

- 6.2.2.6.4.3** The competent authority shall:

- (a) Examine the documentation to verify that the procedures are in accordance with the requirements of the relevant pressure receptacle standards and RID; and
- (b) Conduct an audit in accordance with 6.2.2.6.3.2 to verify that the inspections and tests are carried out as required by the relevant pressure receptacle standards and RID, to the satisfaction of the competent authority.

- 6.2.2.6.4.4** After the audit has been carried out with satisfactory results and all applicable requirements of 6.2.2.6.4 have been satisfied, an approval certificate shall be issued. It shall include the name of the periodic inspection and test body, the registered mark, the address of each facility, and the necessary data for identification of its approved activities (e.g. designation of pressure receptacles, periodic inspection and test method and pressure receptacle standards).

- 6.2.2.6.4.5** If the periodic inspection and test body is denied approval, the competent authority shall provide written detailed reasons for such denial.

**Modifications to periodic inspection and test body approvals**

- 6.2.2.6.4.6** Following approval, the periodic inspection and test body shall notify the issuing competent authority of any modifications to the information submitted under 6.2.2.6.4.2 relating to the initial approval.

The modifications shall be evaluated in order to determine whether the requirements of the relevant pressure receptacle standards and RID will be satisfied. An audit in accordance with 6.2.2.6.3.2 may be required. The competent authority shall accept or reject these modifications in writing, and an amended approval certificate shall be issued as necessary.

- 6.2.2.6.4.7** Upon request, the competent authority shall communicate to any other competent authority, information concerning initial approvals, modifications of approvals, and withdrawn approvals.

**6.2.2.6.5 Periodic inspection and test and certification**

The application of the periodic inspection and test marking to a pressure receptacle shall be considered a declaration that the pressure receptacle complies with the applicable pressure receptacle standards and the requirements of RID. The periodic inspection and test body shall affix the periodic inspection and test marking, including its registered mark, to each approved pressure receptacle (see 6.2.2.7.6).

A record certifying that a pressure receptacle has passed the periodic inspection and test shall be issued by the periodic inspection and test body, before the pressure receptacle is filled.

**6.2.2.6.6 Records**

The periodic inspection and test body shall retain records of pressure receptacle periodic inspection and tests (both passed and failed) including the location of the test facility, for not less than 15 years.

The owner of the pressure receptacle shall retain an identical record until the next periodic inspection and test unless the pressure receptacle is permanently removed from service.

**6.2.2.7 Marking of refillable UN pressure receptacles**

Refillable UN pressure receptacles shall be marked clearly and legibly with certification, operational and manufacturing marks. These marks shall be permanently affixed (e.g. stamped, engraved, or etched) on the pressure receptacle. The marks shall be on the shoulder, top end or neck of the pressure receptacle or on a permanently affixed component of the pressure receptacle (e.g. welded collar or corrosion resistant plate welded on the outer jacket of a closed cryogenic receptacle). Except for the UN packaging symbol, the minimum size of the marks shall be 5 mm for pressure receptacles with a diameter greater than or equal to 140 mm and 2.5 mm for pressure receptacles with a diameter less than 140 mm. The minimum size of the UN packaging symbol shall be 10 mm for pressure receptacles with a diameter greater than or equal to 140 mm and 5 mm for pressure receptacles with a diameter less than 140 mm.

- 6.2.2.7.1** The following certification marks shall be applied:

- (a) The United Nations packaging symbol .

This symbol shall not be used for any purpose other than certifying that a packaging complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5 or 6.6. This symbol shall not be used for pressure receptacles which only conform to the requirements of 6.2.3 to 6.2.5 (see 6.2.3.9).

- (b) The technical standard (e.g. ISO 9809-1) used for design, manufacture and testing;  
(c) The character(s) identifying the country of approval as indicated by the distinguishing signs for motor vehicles in international traffic<sup>2</sup>;

**NOTE:** The country of approval shall be understood to be the country that approved the body which inspected the individual receptacle at time of manufacture.

- (d) The identity mark or stamp of the inspection body that is registered with the competent authority of the country authorizing the marking;  
(e) The date of the initial inspection, the year (four digits) followed by the month (two digits) separated by a slash (i.e. "/");

- 6.2.2.7.2** The following operational marks shall be applied:

- (f) The test pressure in bar, preceded by the letters "PH" and followed by the letters "BAR";

---

<sup>2</sup> Distinguishing signs for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

- (g) The mass of the empty pressure receptacle including all permanently attached integral parts (e.g. neck ring, foot ring, etc.) in kilograms, followed by the letters "KG". This mass shall not include the mass of valve, valve cap or valve guard, any coating, or porous material for acetylene. The mass shall be expressed to three significant figures rounded up to the last digit. For cylinders of less than 1 kg, the mass shall be expressed to two significant figures rounded up to the last digit. In the case of pressure receptacles for UN No. 1001 acetylene, dissolved and UN No. 3374 acetylene, solvent free, at least one decimal shall be shown after the decimal point and two digits for pressure receptacles of less than 1 kg;
- (h) The minimum guaranteed wall thickness of the pressure receptacle in millimetres followed by the letters "MM". This mark is not required for pressure receptacles with a water capacity less than or equal to 1 litre or for composite cylinders or for closed cryogenic receptacles;
- (i) In the case of pressure receptacles for compressed gases, UN No. 1001 acetylene, dissolved, and UN No. 3374 acetylene, solvent free, the working pressure in bar, preceded by the letters "PW". In the case of closed cryogenic receptacles, the maximum allowable working pressure preceded by the letters "MAWP";
- (j) In the case of pressure receptacles for liquefied gases and refrigerated liquefied gases, the water capacity in litres expressed to three significant figures rounded down to the last digit, followed by the letter "L". If the value of the minimum or nominal water capacity is an integer, the figures after the decimal point may be neglected;
- (k) In the case of pressure receptacles for UN No. 1001 acetylene, dissolved, the total of the mass of the empty receptacle, the fittings and accessories not removed during filling, any coating, the porous material, the solvent and the saturation gas expressed to three significant figures rounded down to the last digit followed by the letters "KG". At least one decimal shall be shown after the decimal point. For pressure receptacles of less than 1 kg, the mass shall be expressed to two significant figures rounded down to the last digit;
- (l) In the case of pressure receptacles for UN No. 3374 acetylene, solvent free, the total of the mass of the empty receptacle, the fittings and accessories not removed during filling, any coating, and the porous material expressed to three significant figures rounded down to the last digit followed by the letters "KG". At least one decimal shall be shown after the decimal point. For pressure receptacles of less than 1 kg, the mass shall be expressed to two significant figures rounded down to the last digit;

**6.2.2.7.3** The following manufacturing marks shall be applied:

- (m) Identification of the cylinder thread (e.g. 25E). This mark is not required for closed cryogenic receptacles;
- (n) The manufacturer's mark registered by the competent authority. When the country of manufacture is not the same as the country of approval, then the manufacturer's mark shall be preceded by the character(s) identifying the country of manufacture as indicated by the distinguishing signs for motor vehicles in international traffic. The country mark and the manufacturer's mark shall be separated by a space or slash;
- (o) The serial number assigned by the manufacturer;
- (p) In the case of steel pressure receptacles and composite pressure receptacles with steel liner intended for the carriage of gases with a risk of hydrogen embrittlement, the letter "H" showing compatibility of the steel (see ISO 11114-1:1997).

**6.2.2.7.4** The above marks shall be placed in three groups:

- Manufacturing marks shall be the top grouping and shall appear consecutively in the sequence given in 6.2.2.7.3.
- The operational marks in 6.2.2.7.2 shall be the middle grouping and the test pressure (f) shall be immediately preceded by the working pressure (i) when the latter is required.
- Certification marks shall be the bottom grouping and shall appear in the sequence given in 6.2.2.7.1.

The following is an example of the markings applied to a cylinder.

**6.2.2.7.5** Other marks are allowed in areas other than the side wall, provided they are made in low stress areas and are not of a size and depth that will create harmful stress concentrations. In the case of closed cryogenic receptacles, such marks may be on a separate plate attached to the outer jacket. Such marks shall not conflict with required marks.

**6.2.2.7.6** In addition to the preceding marks, each refillable pressure receptacle that meets the periodic inspection and test requirements of 6.2.2.4 shall be marked indicating:

- (a) The character(s) identifying the country authorizing the body performing the periodic inspection and test. This marking is not required if this body is approved by the competent authority of the country approving manufacture;
- (b) The registered mark of the body authorised by the competent authority for performing periodic inspection and test;
- (c) The date of the periodic inspection and test, the year (two digits) followed by the month (two digits) separated by a slash (i.e. "/" ). Four digits may be used to indicate the year.

The above marks shall appear consecutively in the sequence given.

**6.2.2.7.7** For acetylene cylinders, with the agreement of the competent authority, the date of the most recent periodic inspection and the stamp of the body performing the periodic inspection and test may be engraved on a ring held on the cylinder by the valve. The ring shall be configured so that it can only be removed by disconnecting the valve from the cylinder.

#### **6.2.2.8 Marking of non-refillable UN pressure receptacles**

Non-refillable UN pressure receptacles shall be marked clearly and legibly with certification and gas or pressure receptacle specific marks. These marks shall be permanently affixed (e.g. stencilled, stamped, engraved, or etched) on the pressure receptacle. Except when stencilled, the marks shall be on the shoulder, top end or neck of the pressure receptacle or on a permanently affixed component of the pressure receptacle (e.g. welded collar). Except for the UN packaging symbol and the "DO NOT REFILL" mark, the minimum size of the marks shall be 5 mm for pressure receptacles with a diameter greater than or equal to 140 mm and 2.5 mm for pressure receptacles with a diameter less than 140 mm. The minimum size of the UN packaging symbol shall be 10 mm for pressure receptacles with a diameter greater than or equal to 140 mm and 5 mm for pressure receptacles with a diameter less than 140 mm. The minimum size of the "DO NOT REFILL" mark shall be 5 mm.

**6.2.2.8.1** The marks listed in 6.2.2.7.1 to 6.2.2.7.3 shall be applied with the exception of (g), (h) and (m). The serial number (o) may be replaced by the batch number. In addition, the words "DO NOT REFILL" in letters of at least 5 mm in height are required.

**6.2.2.8.2** The requirements of 6.2.2.7.4 shall apply.

**NOTE:** Non-refillable pressure receptacles may, on account of their size, substitute this marking by a label.

**6.2.2.8.3** Other marks are allowed provided they are made in low stress areas other than the side wall and are not of a size and depth that will create harmful stress concentrations. Such marks shall not conflict with required marks.

#### **6.2.2.9 Equivalent procedures for conformity assessment and periodic inspection and test**

For UN pressure receptacles the requirements of 6.2.2.5 and 6.2.2.6 are considered to have been complied with when the following procedures are applied:

Procedure	Relevant body
Type approval (1.8.7.2)	Xa
Supervision of manufacture (1.8.7.3)	Xa or IS
Initial inspection and tests (1.8.7.4)	Xa or IS
Periodic inspection (1.8.7.5)	Xa or Xb or IS

Xa means the competent authority, its delegate or inspection body conforming to 1.8.6.4 and accredited according to EN ISO/IEC 17020: 2004 type A.

Xb means inspection body conforming to 1.8.6.4 and accredited according to EN ISO/IEC 17020: 2004 type B.

IS means an in-house inspection service of the applicant under the surveillance of an inspection body conforming to 1.8.6.4 and accredited according to EN ISO/IEC 17020:2004 type A. The in-house inspection service shall be independent from design process, manufacturing operations, repair and maintenance.

**6.2.3 General requirements for non-UN pressure receptacles****6.2.3.1 Design and construction**

**6.2.3.1.1** Pressure receptacles and their closures not designed, constructed, inspected, tested and approved according to the requirements of 6.2.2 shall be designed, constructed, inspected, tested and approved in accordance with the general requirements of 6.2.1 as supplemented or modified by the requirements of this section and those of 6.2.4 or 6.2.5.

**6.2.3.1.2** Whenever possible the wall thickness shall be determined by calculation, accompanied, if needed, by experimental stress analysis. Otherwise the wall thickness may be determined by experimental means.

Appropriate design calculations for the pressure envelope and supporting components shall be used to ensure the safety of the pressure receptacles concerned.

The minimum wall thickness to withstand pressure shall be calculated in particular with regard to:

- the calculation pressures, which shall not be less than the test pressure;
- the calculation temperatures allowing for appropriate safety margins;
- the maximum stresses and peak stress concentrations where necessary;
- factors inherent to the properties of the material.

**6.2.3.1.3** For welded pressure receptacles, only metals of weldable quality whose adequate impact strength at an ambient temperature of –20 °C can be guaranteed shall be used.

**6.2.3.1.4** For closed cryogenic receptacles, the impact strength to be established as required by 6.2.1.1.8.1 shall be tested as laid down in 6.8.5.3.

**6.2.3.2** (Reserved)

**6.2.3.3 Service equipment**

**6.2.3.3.1** Service equipment shall comply with 6.2.1.3.

**6.2.3.3.2 Openings**

Pressure drums may be provided with openings for filling and discharge and with other openings intended for level gauges, pressure gauges or relief devices. The number of openings shall be kept to a minimum consistent with safe operations. Pressure drums may also be provided with an inspection opening, which shall be closed by an effective closure.

**6.2.3.3.3 Fittings**

- (a) If cylinders are fitted with a device to prevent rolling, this device shall not be integral with the valve cap;
- (b) Pressure drums which are capable of being rolled shall be equipped with rolling hoops or be otherwise protected against damage due to rolling (e.g. by corrosion resistant metal sprayed on to the pressure receptacle surface);
- (c) Bundles of cylinders shall be fitted with appropriate devices ensuring that they can be handled and carried safely;
- (d) If level gauges, pressure gauges or relief devices are installed, they shall be protected in the same way as is required for valves in 4.1.6.8.

**6.2.3.4 Initial inspection and test**

**6.2.3.4.1** New pressure receptacles shall be subjected to testing and inspection during and after manufacture in accordance with the requirements of 6.2.1.5 except that 6.2.1.5.1 (g) shall be replaced by the following:

- (g) A hydraulic pressure test. Pressure receptacles shall withstand the test pressure without undergoing permanent deformation or exhibiting cracks.

**6.2.3.4.2 Specific provisions applying to aluminium alloy pressure receptacles**

- (a) In addition to the initial inspection required by 6.2.1.5.1, it is necessary to test for possible intercrystalline corrosion of the inside wall of the pressure receptacles where use is made of an aluminium alloy containing copper, or where use is made of an aluminium alloy containing magnesium and manganese and the magnesium content is greater than 3.5% or the manganese content lower than 0.5%;
- (b) In the case of an aluminium/copper alloy the test shall be carried out by the manufacturer at the time of approval of a new alloy by the competent authority; it shall thereafter be repeated in the course of production, for each pour of the alloy;
- (c) In the case of an aluminium/magnesium alloy the test shall be carried out by the manufacturer at the time of approval of a new alloy and of the manufacturing process by the competent authority. The test

shall be repeated whenever a change is made in the composition of the alloy or in the manufacturing process.

#### **6.2.3.5 Periodic inspection and test**

##### **6.2.3.5.1 Periodic inspection and test shall be in accordance with 6.2.1.6.1.**

**NOTE:** With the agreement of the competent authority of the country that issued the type approval, the hydraulic pressure test of each welded steel cylinder intended for the carriage of gases of UN No. 1965, hydrocarbon gas mixture liquefied, n.o.s., with a capacity below 6.5 l may be replaced by another test ensuring an equivalent level of safety.

##### **6.2.3.5.2 Closed cryogenic receptacles shall be subjected to periodic inspections and tests by a body authorised by the competent authority in accordance with the periodicity defined in packing instruction P203 of 4.1.4.1 to verify external conditions, condition and operation of pressure relief devices and be subjected to a leakproofness test at 90% of the maximum working pressure. The leakproofness test shall be carried out with the gas contained in the pressure receptacle or with an inert gas. Checking shall be performed by means of a pressure gauge or by vacuum measurement. The thermal insulation need not be removed.**

#### **6.2.3.6 Approval of pressure receptacles**

##### **6.2.3.6.1 The procedures for conformity assessment and periodic inspection of section 1.8.7 shall be performed by the relevant body according to the following Table.**

<b>Procedure</b>	<b>Relevant body</b>
Type approval (1.8.7.2)	Xa
Supervision of manufacture (1.8.7.3)	Xa or IS
Initial inspection and tests (1.8.7.4)	Xa or IS
Periodic inspection (1.8.7.5)	Xa or Xb or IS

The conformity assessment of valves and other accessories having a direct safety function may be carried out separately from the receptacles and the conformity assessment procedure shall be at least as stringent as that undergone by the pressure receptacle to which they are fitted.

Xa means the competent authority, its delegate or inspection body conforming to 1.8.6.4 and accredited according to EN ISO/IEC 17020:2004 type A.

Xb means inspection body conforming to 1.8.6.4 and accredited according to EN ISO/IEC 17020:2004 type B.

IS means an in-house inspection service of the applicant under the surveillance of an inspection body conforming to 1.8.6.4 and accredited according to EN ISO/IEC 17020:2004 type A. The in-house inspection service shall be independent from design process, manufacturing operations, repair and maintenance.

##### **6.2.3.6.2 If the country of approval is not a COTIF Member State or a Contracting Party to ADR, the competent authority mentioned in 6.2.1.7.2 shall be the competent authority of a COTIF Member State or a Contracting Party to ADR.**

#### **6.2.3.7 Requirements for manufacturers**

##### **6.2.3.7.1 The relevant requirements of 1.8.7 shall be met.**

#### **6.2.3.8 Requirements for inspection bodies**

The requirements of 1.8.6 shall be met.

#### **6.2.3.9 Marking of refillable pressure receptacles**

##### **6.2.3.9.1 Markings shall be in accordance with sub-section 6.2.2.7 with the following variations.**

##### **6.2.3.9.2 The United Nations packaging symbol specified in 6.2.2.7.1 (a) shall not be applied.**

##### **6.2.3.9.3 The requirements of 6.2.2.7.2 (j) shall be replaced by the following:**

- (j) The water capacity of the pressure receptacle in litres followed by the letter "L". In the case of pressure receptacles for liquefied gases the water capacity in litres shall be expressed to three significant figures rounded down to the last digit. If the value of the minimum or nominal water capacity is an integer, the figures after the decimal point may be neglected.

**6.2.3.9.4** The marks specified in 6.2.2.7.2 (g) and (h) and 6.2.2.7.3 (m) are not required for pressure receptacles for UN No. 1965 hydrocarbon gas mixture, liquefied, n.o.s.

**6.2.3.9.5** When marking the date required by 6.2.2.7.6 (c), the month need not be indicated for gases for which the interval between periodic inspections is 10 years or more (see packing instructions P200 and P203 of 4.1.4.1).

**6.2.3.9.6** The marks in accordance with 6.2.2.7.6 may be engraved on a ring of an appropriate material affixed to the cylinder when the valve is installed and which is removable only by disconnecting the valve from the cylinder.

#### **6.2.3.10 Marking of non-refillable pressure receptacles**

**6.2.3.10.1** Markings shall be in accordance with 6.2.2.8, except that the United Nations packaging symbol specified in 6.2.2.7.1 (a) shall not be applied.

#### **6.2.4 Requirements for non-UN pressure receptacles designed, constructed and tested according to standards**

**NOTE:** Persons or bodies identified in standards as having responsibilities in accordance with RID shall meet the requirements of RID.

Depending on the date of construction of the pressure receptacle, the standards listed in the Table below shall be applied as indicated in column (4) to meet the requirements of Chapter 6.2 referred to in column (3) or may be applied as indicated in column (5). The requirements of Chapter 6.2 referred to in column (3) shall prevail in all cases.

If more than one standard is listed as mandatory for the application of the same requirements, only one of them shall be applied, but in full unless otherwise specified in the Table below.

EN 14912:2005	LPG equipment and accessories – Inspection and maintenance of LPG cylinder valves at time of periodic inspection of cylinders	6.2.3.5	As from 1 January 2011	Before 1 January 2011

(a) Unless the application of another standard is authorized in column (5) for the same purposes for pressure receptacles constructed at the same date.

#### 6.2.5 Requirements for **non-UN** pressure receptacles not designed, constructed and tested according to standards

To reflect scientific and technical progress or where no standard is listed in 6.2.2 or 6.2.4, or to deal with specific aspects not addressed in a standard listed in 6.2.2 or 6.2.4, the competent authority may recognize the use of a technical code providing the same level of safety.

The competent authority shall transmit to the secretariat of OTIF a list of the technical codes that it recognises. The list should include the following details: name and date of the code, purpose of the code and details of where it may be obtained. The secretariat shall make this information publicly available on its web-site.

The requirements of 6.2.1, 6.2.3 and the following requirements however shall be met.

**NOTE:** For this section, the references to technical standards in 6.2.1 shall be considered as references to technical codes.

#### 6.2.5.1 Materials

The following provisions contain examples of materials that may be used to comply with the requirements for materials in 6.2.1.2:

- (a) Carbon steel for compressed, liquefied, refrigerated liquefied gases and dissolved gases as well as for substances not in Class 2 listed in Table 3 of packing instruction P200 of 4.1.4.1;
- (b) Alloy steel (special steels), nickel, nickel alloy (such as monel) for compressed, liquefied, refrigerated liquefied gases and dissolved gases as well as for substances not in Class 2 listed in Table 3 of packing instruction P200 of 4.1.4.1;
- (c) Copper for:
  - (i) gases of classification codes 1A, 1O, 1F and 1TF, whose filling pressure referred to a temperature of 15 °C does not exceed 2 MPa (20 bar);
  - (ii) gases of classification code 2A and also UN No. 1033 dimethyl ether; UN No. 1037 ethyl chloride; UN No. 1063 methyl chloride; UN No. 1079 sulphur dioxide; UN No. 1085 vinyl bromide; UN No. 1086 vinyl chloride; and UN No. 3300 ethylene oxide and carbon dioxide mixture with more than 87% ethylene oxide;
  - (iii) gases of classification codes 3A, 3O and 3F;
- (d) Aluminium alloy: see special requirement "a" of packing instruction P200 (10) of 4.1.4.1;
- (e) Composite material for compressed, liquefied, refrigerated liquefied gases and dissolved gases;
- (f) Synthetic materials for refrigerated liquefied gases; and
- (g) Glass for the refrigerated liquefied gases of classification code 3A other than UN No. 2187 carbon dioxide, refrigerated, liquid or mixtures thereof, and gases of classification code 3O.

#### 6.2.5.2 Service equipment

(Reserved)

**6.2.5.3 Metal cylinders, tubes, pressure drums and bundles of cylinders**

At the test pressure, the stress in the metal at the most severely stressed point of the pressure receptacle shall not exceed 77% of the guaranteed minimum yield stress ( $R_e$ ).

"Yield stress" means the stress at which a permanent elongation of 2 per thousand (i.e. 0.2%) or, for austenitic steels, 1% of the gauge length on the test-piece, has been produced.

**NOTE:** In the case of sheet-metal the axis of the tensile test-piece shall be at right angles to the direction of rolling. The permanent elongation at fracture, shall be measured on a test-piece of circular cross-section in which the gauge length "l" is equal to five times the diameter "d" ( $l = 5d$ ); if test pieces of rectangular cross-section are used, the gauge length "l" shall be calculated by the formula:

$$l = 5.65 \sqrt{F_0}$$

where  $F_0$  indicates the initial cross-sectional area of the test-piece.

Pressure receptacles and their closures shall be made of suitable materials which shall be resistant to brittle fracture and to stress corrosion cracking between  $-20\text{ }^{\circ}\text{C}$  and  $+50\text{ }^{\circ}\text{C}$ .

Welds shall be skilfully made and shall afford the fullest safety.

**6.2.5.4 Additional provisions relating to aluminium-alloy pressure receptacles for compressed gases, liquefied gases, dissolved gases and non pressurized gases subject to special requirements (gas samples) as well as articles containing gas under pressure other than aerosol dispensers and small receptacles containing gas (gas cartridges)****6.2.5.4.1** The materials of aluminium-alloy pressure receptacles which are to be accepted shall satisfy the following requirements:

	A	B	C	D
Tensile strength, $R_m$ , in MPa ( $= \text{N/mm}^2$ )	49 to 186	196 to 372	196 to 372	343 to 490
Yield stress, $R_e$ , in MPa ( $= \text{N/mm}^2$ ) (permanent set $\lambda = 0.2\%$ )	10 to 167	59 to 314	137 to 334	206 to 412
Permanent elongation at fracture ( $l = 5d$ ) in per cent	12 to 40	12 to 30	12 to 30	11 to 16
Bend test (diameter of former $d = n \times e$ , where $e$ is the thickness of the test piece)	$n = 5$ ( $R_m \leq 98$ ) $n = 6$ ( $R_m > 98$ )	$n = 6$ ( $R_m \leq 325$ ) $n = 7$ ( $R_m > 325$ )	$n = 6$ ( $R_m \leq 325$ ) $n = 7$ ( $R_m > 325$ )	$n = 7$ ( $R_m \leq 392$ ) $n = 8$ ( $R_m > 392$ )
Aluminium Association Series Number <sup>(a)</sup>	1000	5000	6000	2000

<sup>(a)</sup> See "Aluminium Standards and Data", Fifth edition, January 1976, published by the Aluminium Association, 750 Third Avenue, New York.

The actual properties will depend on the composition of the alloy concerned and on the final treatment of the pressure receptacle, but whatever alloy is used the thickness of the pressure receptacle shall be calculated by one of the following formulae:

$$e = \frac{P_{\text{MPa}} \times D}{\frac{2 \times R_e}{1.30} + P_{\text{MPa}}} \quad \text{or} \quad e = \frac{P_{\text{bar}} \times D}{\frac{20 \times R_e}{1.30} + P_{\text{bar}}}$$

where

$e$  = minimum thickness of pressure receptacle wall, in mm;

$P_{\text{MPa}}$  = test pressure, in MPa

$P_{\text{bar}}$  = test pressure, in bar

$D$  = nominal external diameter of the pressure receptacle, in mm

and

$R_e$  = guaranteed minimum proof stress with 0.2% proof stress, in MPa ( $= \text{N/mm}^2$ )

In addition, the value of the minimum guaranteed proof stress ( $R_e$ ) introduced into the formula is in no case to be greater than 0.85 times the guaranteed minimum tensile strength ( $R_m$ ), whatever the type of alloy used.

**NOTE 1:** The above characteristics are based on previous experience with the following materials used for pressure receptacles:

Column A: Aluminium, unalloyed, 99.5% pure;

Column B: Alloys of aluminium and magnesium;

Column C: Alloys of aluminium, silicon and magnesium, such as ISO/R209-Al-Si-Mg (Aluminium Association 6351);

Column D: Alloys of aluminium, copper and magnesium.

- 2: The permanent elongation at fracture is measured by means of test-pieces of circular cross-section in which the gauge length "l" is equal to five times the diameter "d" ( $l = 5d$ ); if test-pieces of rectangular section are used the gauge length shall be calculated by the formula:

$$l = 5.65 \sqrt{F_0}$$

where  $F_0$  is the initial cross-section area of the test-piece.

- 3: (a) The bend test (see diagram) shall be carried out on specimens obtained by cutting into two equal parts of width  $3e$ , but in no case less than 25 mm, an annular section of a cylinder. The specimens shall not be machined elsewhere than on the edges;
- (b) The bend test shall be carried out between a mandrel of diameter ( $d$ ) and two circular supports separated by a distance of  $(d + 3e)$ . During the test the inner faces shall be separated by a distance not greater than the diameter of the mandrel;
- (c) The specimen shall not exhibit cracks when it has been bent inwards around the mandrel until the inner faces are separated by a distance not greater than the diameter of the mandrel;
- (d) The ratio ( $n$ ) between the diameter of the mandrel and the thickness of the specimen shall conform to the values given in the Table.

Diagram of bend test

**6.2.5.4.2** A lower minimum elongation value is acceptable on condition that an additional test approved by the competent authority of the country in which the pressure receptacles are made proves that safety of carriage is ensured to the same extent as in the case of pressure receptacles constructed to comply with the characteristics given in the Table in 6.2.5.4.1 (see also EN 1975: 1999 + A1:2003).

**6.2.5.4.3** The wall thickness of the pressure receptacles at the thinnest point shall be the following:

- where the diameter of the pressure receptacle is less than 50 mm: not less than 1.5 mm;
- where the diameter of the pressure receptacle is from 50 to 150 mm: not less than 2 mm; and
- where the diameter of the pressure receptacle is more than 150 mm: not less than 3 mm.

**6.2.5.4.4** The ends of the pressure receptacles shall have a semicircular, elliptical or "basket-handle" section; they shall afford the same degree of safety as the body of the pressure receptacle.

#### **6.2.5.5 Pressure receptacles in composite materials**

For cylinders, tubes, pressure drums and bundles of cylinders which make use of composite materials, the construction shall be such that a minimum burst ratio (burst pressure divided by test pressure) is:

- 1.67 for hoop wrapped pressure receptacles;
- 2.00 for fully wrapped pressure receptacles.

#### **6.2.5.6 Closed cryogenic receptacles**

The following requirements apply to the construction of closed cryogenic receptacles for refrigerated liquefied gases:

**6.2.5.6.1** If non-metallic materials are used, they shall resist brittle fracture at the lowest working temperature of the pressure receptacle and its fittings.

**6.2.5.6.2** The pressure relief devices shall be so constructed as to work perfectly even at their lowest working temperature. Their reliability of functioning at that temperature shall be established and checked by testing each device or a sample of devices of the same type of construction.

**6.2.5.6.3** The vents and pressure relief devices of pressure receptacles shall be so designed as to prevent the liquid from splashing out.

**6.2.6 General requirements for aerosol dispensers, small receptacles containing gas (gas cartridges) and fuel cell cartridges containing liquefied flammable gas**

**6.2.6.1 Design and construction**

**6.2.6.1.1** Aerosol dispensers (UN No.1950 aerosols) containing only a gas or a mixture of gases, and small receptacles containing gas (gas cartridges) (UN No. 2037), shall be made of metal. This requirement shall not apply to aerosols and small receptacles containing gas (gas cartridges) with a maximum capacity of 100 ml for UN No. 1011 butane. Other aerosol dispensers (UN No.1950 aerosols) shall be made of metal, synthetic material or glass. Receptacles made of metal and having an outside diameter of not less than 40 mm shall have a concave bottom.

**6.2.6.1.2** The capacity of receptacles made of metal shall not exceed 1 000 ml; that of receptacles made of synthetic material or of glass shall not exceed 500 ml.

**6.2.6.1.3** Each model of receptacles (aerosol dispensers or cartridges) shall, before being put into service, satisfy a hydraulic pressure test carried out in conformity with 6.2.6.2.

**6.2.6.1.4** The release valves and dispersal devices of aerosol dispensers (UN No.1950 aerosols) and the valves of UN No. 2037 small receptacles containing gas (gas cartridges) shall ensure that the receptacles are so closed as to be leakproof and shall be protected against accidental opening. Valves and dispersal devices which close only by the action of the internal pressure are not to be accepted.

**6.2.6.1.5** The internal pressure at 50 °C shall exceed neither two-thirds of the test pressure nor 1.32 MPa (13.2 bar). Aerosol dispensers and small receptacles containing gas (gas cartridges) shall be so filled that at 50 °C the liquid phase does not exceed 95% of their capacity.

**6.2.6.2 Hydraulic pressure test**

**6.2.6.2.1** The internal pressure to be applied (test pressure) shall be 1.5 times the internal pressure at 50 °C, with a minimum pressure of 1 MPa (10 bar).

**6.2.6.2.2** The hydraulic pressure tests shall be carried out on at least five empty receptacles of each model:

- (a) until the prescribed test pressure is reached, by which time no leakage or visible permanent deformation shall have occurred; and
- (b) until leakage or bursting occurs; the dished end, if any, shall yield first and the receptacle shall not leak or burst until a pressure 1.2 times the test pressure has been reached or passed.

**6.2.6.3 Tightness (leakproofness) test**

**6.2.6.3.1 Small receptacles containing gas (gas cartridges) and fuel cell cartridges containing liquefied flammable gas**

**6.2.6.3.1.1** Each receptacle or fuel cell cartridge shall satisfy a tightness (leakproofness) test in a hot-water bath.

**6.2.6.3.1.2** The temperature of the bath and the duration of the test shall be such that the internal pressure of each receptacle or fuel cell cartridge reaches at least 90% of the internal pressure that would be reached at 55 °C. However, if the contents are sensitive to heat or if the receptacles or the fuel cell cartridges are made of a plastics material which softens at this temperature, the temperature of the bath shall be from 20 °C to 30 °C. In addition, one receptacle or fuel cell cartridge out of every 2 000 shall be tested at 55 °C.

**6.2.6.3.1.3** No leakage or permanent deformation of a receptacle or fuel cell cartridge shall occur, except that a plastics receptacle or fuel cell cartridge may be deformed through softening, provided that it does not leak.

**6.2.6.3.2 Aerosol dispensers**

Each filled aerosol dispenser shall be subjected to a test performed in a hot water bath or an approved water bath alternative.

**6.2.6.3.2.1** Hot water bath test

**6.2.6.3.2.1.1** The temperature of the water bath and the duration of the test shall be such that the internal pressure reaches that which would be reached at 55 °C (50 °C if the liquid phase does not exceed 95% of the capacity of the aerosol dispenser at 50 °C). If the contents are sensitive to heat or if the aerosol dispensers are made of plastics material which softens at this test temperature, the temperature of the bath shall be set at between 20 °C and 30 °C but, in addition, one aerosol dispenser in 2000 shall be tested at the higher temperature.

**6.2.6.3.2.1.2** No leakage or permanent deformation of an aerosol dispenser may occur, except that a plastics aerosol dispenser may be deformed through softening, provided that it does not leak.

**6.2.6.3.2.2** Alternative methods

With the approval of the competent authority alternative methods which provide an equivalent level of safety may be used, provided that the requirements of 6.2.6.3.2.2.1, 6.2.6.3.2.2.2 and 6.2.6.3.2.2.3 are met.

**6.2.6.3.2.2.1** Quality system

Aerosol dispenser fillers and component manufacturers shall have a quality system. The quality system shall implement procedures to ensure that all aerosol dispensers that leak or that are deformed are rejected and not offered for carriage.

The quality system shall include:

- (a) a description of the organizational structure and responsibilities;
- (b) the relevant inspection and test, quality control, quality assurance, and process operation instructions that will be used;
- (c) quality records, such as inspection reports, test data, calibration data and certificates;
- (d) management reviews to ensure the effective operation of the quality system;
- (e) a process for control of documents and their revision;
- (f) a means for control of non-conforming aerosol dispensers;
- (g) training programmes and qualification procedures for relevant personnel; and
- (h) procedures to ensure that there is no damage to the final product.

An initial audit and periodic audits shall be conducted to the satisfaction of the competent authority. These audits shall ensure the approved system is and remains adequate and efficient. Any proposed changes to the approved system shall be notified to the competent authority in advance.

**6.2.6.3.2.2.2** Pressure and leak testing of aerosol dispensers before filling

Every empty aerosol dispenser shall be subjected to a pressure equal to or in excess of the maximum expected in the filled aerosol dispensers at 55 °C (50 °C if the liquid phase does not exceed 95% of the capacity of the receptacle at 50 °C). This shall be at least two-thirds of the design pressure of the aerosol dispenser. If any aerosol dispenser shows evidence of leakage at a rate equal to or greater than  $3.3 \times 10^{-2}$  mbar·l·s<sup>-1</sup> at the test pressure, distortion or other defect, it shall be rejected.

**6.2.6.3.2.2.3** Testing of the aerosol dispensers after filling

Prior to filling the filler shall ensure that the crimping equipment is set appropriately and the specified propellant is used.

Each filled aerosol dispenser shall be weighed and leak tested. The leak detection equipment shall be sufficiently sensitive to detect at least a leak rate of  $2.0 \times 10^{-3}$  mbar·l·s<sup>-1</sup> at 20 °C.

Any filled aerosol dispenser which shows evidence of leakage, deformation or excessive weight shall be rejected.

**6.2.6.3.3** With the approval of the competent authority, aerosols and receptacles, small, containing pharmaceutical products and non flammable gases which are required to be sterile, but may be adversely affected by water bath testing, are not subject to 6.2.6.3.1 and 6.2.6.3.2 if:

- (a) They are manufactured under the authority of a national health administration and, if required by the competent authority, follow the principles of Good Manufacturing Practice (GMP) established by the World Health Organization (WHO)<sup>3</sup>; and

---

<sup>3</sup> WHO Publication: "Quality assurance of pharmaceuticals. A compendium of guidelines and related materials. Volume 2: Good manufacturing practices and inspection".

- (b) An equivalent level of safety is achieved by the manufacturer's use of alternative methods for leak detection and pressure resistance, such as helium detection and water bathing a statistical sample of at least 1 in 2000 from each production batch.

**6.2.6.4****Reference to standards**

The requirements of this section are deemed to be met if the following standards are complied with:

- for aerosol dispensers (UN No. 1950 aerosols): Annex to Council Directive 75/324/EEC<sup>4</sup> as amended by Commission Directive 94/1/EC<sup>5</sup>;
- for UN No. 2037, small receptacles containing gas (gas cartridges) containing UN No. 1965, hydrocarbon gas mixture n.o.s, liquefied: EN 417:2003 Non-refillable metallic gas cartridges for liquefied petroleum gases, with or without a valve, for use with portable appliances – Construction, inspection, testing and marking.

---

<sup>4</sup> Council Directive 75/324/EEC of 20 May 1975 on the approximation of the laws of the Member States relating to aerosol dispensers, published in the Official Journal of the European Communities No. L 147 of 9 June 1975.

<sup>5</sup> Commission Directive 94/1/EC of January 1994, adapting some technicalities of Council Directive 75/324/EEC on the approximation of the laws of the relating Member States to aerosol dispensers published in the Official Journal of the European Communities No. L 23 of 28 January 1994.

## Chapter 6.3

### Requirements for the construction and testing of packagings for class 6.2 infectious substances of category A

**NOTE:** The requirements of this Chapter don't apply to packagings used for the carriage of Class 6.2 substances according to packing instruction P621 of 4.1.4.1.

#### 6.3.1 General

**6.3.1.1** The requirements of this Chapter apply to packagings intended for the carriage of infectious substances of Category A.

#### 6.3.2 Requirements for packagings

**6.3.2.1** The requirements for packagings in this section are based on packagings, as specified in 6.1.4, currently used. In order to take into account progress in science and technology, there is no objection to the use of packagings having specifications different from those in this Chapter, provided that they are equally effective, acceptable to the competent authority and able successfully to withstand the tests described in 6.3.5. Methods of testing other than those described in RID are acceptable, provided they are equivalent, and are recognized by the competent authority.

**6.3.2.2** Packagings shall be manufactured and tested under a quality assurance programme which satisfies the competent authority in order to ensure that each packaging meets the requirements of this Chapter.

**NOTE:** ISO 16106:2006 "Packaging – Transport packages for dangerous goods – Dangerous goods packagings, intermediate bulk containers (IBCs) and large packagings – Guidelines for the application of ISO 9001" provides acceptable guidance on procedures which may be followed.

**6.3.2.3** Manufacturers and subsequent distributors of packagings shall provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that packages as presented for carriage are capable of passing the applicable performance tests of this Chapter.

#### 6.3.3 Code for designating types of packagings

**6.3.3.1** The codes for designating types of packagings are set out in 6.1.2.7.

**6.3.3.2** The letters "U" or "W" may follow the packaging code. The letter "U" signifies a special packaging conforming to the requirements of 6.3.5.1.6. The letter "W" signifies that the packaging, although, of the same type indicated by the code is manufactured to a specification different from that in 6.1.4 and is considered equivalent under the requirements of 6.3.2.1.

#### 6.3.4 Marking

**NOTE 1:** The marking indicates that the packaging which bears it corresponds to a successfully tested design type and that it complies with the requirements of this Chapter which are related to the manufacture, but not to the use, of the packaging.

**2:** The marking is intended to be of assistance to packaging manufacturers, reconditioners, packaging users, carriers and regulatory authorities.

**3:** The marking does not always provide full details of the test levels, etc., and these may need to be taken further into account, e.g. by reference to a test certificate, to test reports or to a register of successfully tested packagings.

**6.3.4.1** Each packaging intended for use according to RID shall bear markings which are durable, legible and placed in a location and of such a size relative to the packaging as to be readily visible. For packages with a gross mass of more than 30 kg, the markings or a duplicate thereof shall appear on the top or on a side of the packaging. Letters, numerals and symbols shall be at least 12 mm high, except for packagings of 30 litres or 30 kg capacity or less, when they shall be at least 6 mm in height and for packagings of 5 litres or 5 kg or less when they shall be of an appropriate size.

**6.3.4.2** A packaging that meets the requirements of this section and of 6.3.5 shall be marked with:

- (a) the United Nations packaging symbol . This symbol shall not be used for any purpose other than certifying that a packaging complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5 or 6.6;
- (b) the code designating the type of packaging according to the requirements of 6.1.2;
- (c) the text "CLASS 6.2";
- (d) the last two digits of the year of manufacture of the packaging;

- (e) the state authorizing the allocation of the mark, indicated by the distinguishing sign for motor vehicles in international traffic<sup>1</sup>;
- (f) the name of the manufacturer or other identification of the packaging specified by the competent authority;
- (g) for packagings meeting the requirements of 6.3.5.1.6, the letter "U", inserted immediately following the marking required in (b) above.

**6.3.4.3** Marking shall be applied in the sequence shown in 6.3.4.2 (a) to (g); each element of the marking required in these sub-paragraphs shall be clearly separated, e.g. by a slash or space, so as to be easily identifiable. For examples, see 6.3.4.4.

Any additional markings authorized by a competent authority shall still enable the parts of the mark to be correctly identified with reference to 6.3.4.1.

**6.3.4.4** Example of marking:

	4G/CLASS 6.2/06/ S/SP-9989-ERIKSSON	as in 6.3.4.2 (a), (b), (c) and (d) as in 6.3.4.2 (e) and (f)
---	--	--

### **6.3.5 Test requirements for packagings**

#### **6.3.5.1 Performance and frequency of tests**

**6.3.5.1.1** The design type of each packaging shall be tested as provided in this section in accordance with procedures established by the competent authority allowing the allocation of the mark and shall be approved by this competent authority.

**6.3.5.1.2** Each packaging design type shall successfully pass the tests prescribed in this Chapter before being used. A packaging design type is defined by the design, size, material and thickness, manner of construction and packing, but may include various surface treatments. It also includes packagings which differ from the design type only in their lesser design height.

**6.3.5.1.3** Tests shall be repeated on production samples at intervals established by the competent authority.

**6.3.5.1.4** Tests shall also be repeated after each modification which alters the design, material or manner of construction of a packaging.

**6.3.5.1.5** The competent authority may permit the selective testing of packagings that differ only in minor respects from a tested type, e.g. smaller sizes or lower net mass of primary receptacles; and packagings such as drums and boxes which are produced with small reductions in external dimension(s).

**6.3.5.1.6** Primary receptacles of any type may be assembled within an secondary packaging and carried without testing in the rigid outer packaging under the following conditions:

- (a) The rigid outer packaging shall have been successfully tested in accordance with 6.3.5.2.2 with fragile (e.g. glass) primary receptacles;
- (b) The total combined gross mass of primary receptacles shall not exceed one half the gross mass of primary receptacles used for the drop test in (a) above;
- (c) The thickness of cushioning between primary receptacles and between primary receptacles and the outside of the secondary packaging shall not be reduced below the corresponding thicknesses in the originally tested packaging; and if a single primary receptacle was used in the original test, the thickness of cushioning between primary receptacles shall not be less than the thickness of cushioning between the outside of the secondary packaging and the primary receptacle in the original test. When either fewer or smaller primary receptacles are used (as compared to the primary receptacles used in the drop test), sufficient additional cushioning material shall be used to take up the void spaces;
- (d) The rigid outer packaging shall have successfully passed the stacking test in 6.1.5.6 while empty. The total mass of identical packages shall be based on the combined mass of packagings used in the drop test in (a) above;
- (e) For primary receptacles containing liquids, an adequate quantity of absorbent material to absorb the entire liquid content of the primary receptacles shall be present;
- (f) If the rigid outer packaging is intended to contain primary receptacles for liquids and is not leakproof, or is intended to contain primary receptacles for solids and is not siftproof, a means of containing any liquid or solid contents in the event of leakage shall be provided in the form of a leakproof liner, plastics bag or other equally effective means of containment;

<sup>1</sup> Distinguishing sign for motor vehicles in international traffic prescribed in Vienna Convention on Road Traffic (1968).

(g) In addition to the markings prescribed in 6.3.4.2 (a) to (f), packagings shall be marked in accordance with 6.3.4.2 (g).

**6.3.5.1.7** The competent authority may at any time require proof, by tests in accordance with this section, that serially-produced packagings meet the requirements of the design type tests.

**6.3.5.1.8** Provided the validity of the test results is not affected and with the approval of the competent authority, several tests may be made on one sample.

#### **6.3.5.2 Preparation of packagings for testing**

**6.3.5.2.1** Samples of each packaging shall be prepared as for carriage, except that a liquid or solid infectious substance shall be replaced by water or, where conditioning at  $-18^{\circ}\text{C}$  is specified, by water/antifreeze. Each primary receptacle shall be filled to **not less than 98 % of its capacity**.

**NOTE:** The term water includes water/antifreeze solution with a minimum specific gravity of 0.95 for testing at  $-18^{\circ}\text{C}$ .

#### **6.3.5.2.2 Tests and number of samples required**

Tests required for packaging types

Type of packaging <sup>(a)</sup>			Tests required					
Rigid outer packaging	Primary receptacle		Water spray 6.3.5.3.6.1	Cold conditioning 6.3.5.3.6.2	Drop 6.3.5.3	Additional drop 6.3.5.3.6.3	Puncture 6.3.5.4	Stack 6.1.5.6
	Plastics	Other	No. of samples	No. of samples	No. of samples	No. of samples	No. of samples	No. of samples
Fibreboard box	X		5	5	10	Required on one sample when the packaging is intended to contain dry ice.	2	Required on three samples when testing a "U"-marked packaging as defined in 6.3.5.1.6 for specific provisions.
		X	5	0	5		2	
Fibreboard drum	X		3	3	6		2	
		X	3	0	3		2	
Plastics box	X		0	5	5		2	
		X	0	5	5		2	
Plastics drum/ jerrycan	X		0	3	3		2	
		X	0	3	3		2	
Boxes of other material	X		0	5	5		2	
		X	0	0	5		2	
Drums/jerrycans of other material	X		0	3	3		2	
		X	0	0	3		2	

<sup>(a)</sup> "Type of packaging" categorizes packagings for test purposes according to the kind of packaging and its material characteristics.

**NOTE 1:** In instances where a primary receptacle is made of two or more materials, the material most liable to damage determines the appropriate test.

**2:** The material of the secondary packagings are not taken into consideration when selecting the test or conditioning for the test.

#### **Explanation for use of the Table:**

If the packaging to be tested consists of a fibreboard outer box with a plastics primary receptacle, five samples must undergo the water spray test (see 6.3.5.3.6.1) prior to dropping and another five must be conditioned to  $-18^{\circ}\text{C}$  (see 6.3.5.3.6.2) prior to dropping. If the packaging is to contain dry ice then one further single sample shall be dropped five times after conditioning in accordance with 6.3.5.3.6.3.

Packagings prepared as for carriage shall be subjected to the tests in 6.3.5.3 and 6.3.5.4. For outer packagings, the headings in the Table relate to fibreboard or similar materials whose performance may be rapidly affected by moisture; plastics which may embrittle at low temperature; and other materials such as metal whose performance is not affected by moisture or temperature.

**6.3.5.3 Drop test**

**6.3.5.3.1** Samples shall be subjected to free-fall drops from a height of 9 m onto a non-resilient, horizontal, flat, massive and rigid surface in conformity with 6.1.5.3.4.

**6.3.5.3.2** Where the samples are in the shape of a box, five shall be dropped one in each of the following orientations:

- (a) flat on the base;
- (b) flat on the top;
- (c) flat on the longest side;
- (d) flat on the shortest side;
- (e) on a corner.

**6.3.5.3.3** Where the samples are in the shape of a drum, three shall be dropped one in each of the following orientations:

- (a) diagonally on the top chime, with the centre of gravity directly above the point of impact;
- (b) diagonally on the base chime;
- (c) flat on the side.

**6.3.5.3.4** While the sample shall be released in the required orientation, it is accepted that for aerodynamic reasons the impact may not take place in that orientation.

**6.3.5.3.5** Following the appropriate drop sequence, there shall be no leakage from the primary receptacle(s) which shall remain protected by cushioning/absorbent material in the secondary packaging.

**6.3.5.3.6** Special preparation of test sample for the drop test

**6.3.5.3.6.1 Fibreboard – Water spray test**

Fibreboard outer packagings: The sample shall be subjected to a water spray that simulates exposure to rainfall of approximately 5 cm per hour for at least one hour. It shall then be subjected to the test described in 6.3.5.3.1.

**6.3.5.3.6.2 Plastics material – Cold conditioning**

Plastics primary receptacles or outer packagings: The temperature of the test sample and its contents shall be reduced to –18 °C or lower for a period of at least 24 hours and within 15 minutes of removal from that atmosphere the test sample shall be subjected to the test described in 6.3.5.3.1. Where the sample contains dry ice, the conditioning period shall be reduced to 4 hours.

**6.3.5.3.6.3 Packagings intended to contain dry ice – Additional drop test**

Where the packaging is intended to contain dry ice, a test additional to that specified in 6.3.5.3.1 and, when appropriate, in 6.3.5.3.6.1 or 6.3.5.3.6.2 shall be carried out. One sample shall be stored so that all the dry ice dissipates and then that sample shall be dropped in one of the orientations described in 6.3.5.3.2 which shall be that most likely to result in failure of the packaging.

**6.3.5.4 Puncture test****6.3.5.4.1 Packagings with a gross mass of 7 kg or less**

Samples shall be placed on a level hard surface. A cylindrical steel rod with a mass of at least 7 kg, a diameter of 38 mm and whose impact end edges have a radius not exceeding 6 mm, shall be dropped in a vertical free fall from a height of 1 m, measured from the impact end to the impact surface of the sample. One sample shall be placed on its base. A second sample shall be placed in an orientation perpendicular to that used for the first. In each instance the steel rod shall be aimed to impact the primary receptacle. Following each impact, penetration of the secondary packaging is acceptable, provided that there is no leakage from the primary receptacle(s).

**6.3.5.4.2 Packagings with a gross mass exceeding 7 kg**

Samples shall be dropped on to the end of a cylindrical steel rod. The rod shall be set vertically in a level hard surface. It shall have a diameter of 38 mm and the edges of the upper end a radius not exceeding 6 mm. The rod shall protrude from the surface a distance at least equal to that between the centre of the primary receptacle(s) and the outer surface of the outer packaging with a minimum of 200 mm. One sample shall be dropped with its top face lowermost in a vertical free fall from a height of 1 m, measured from the top of the steel rod. A second sample shall be dropped from the same height in an orientation perpendicular to that used for the first. In each instance, the packaging shall be so orientated that the steel rod would be capable of penetrating the primary receptacle(s). Following each impact, penetration of the secondary packaging is acceptable, provided that there is no leakage from the primary receptacle(s).

**6.3.5.5 Test report**

**6.3.5.5.1** A **written** test report containing at least the following particulars shall be drawn up and shall be available to the users of the packaging:

1. Name and address of the test facility;
2. Name and address of applicant (where appropriate);
3. A unique test report identification;
4. Date of the test **and of the** report;
5. Manufacturer of the packaging;
6. Description of the packaging design type (e.g. dimensions, materials, closures, thickness, etc.), including method of manufacture (e.g. blow moulding) and which may include drawing(s) and/or photograph(s);
7. Maximum capacity;
8. **Test contents**;
9. Test descriptions and results;
10. The test report shall be signed with the name and status of the signatory.

**6.3.5.5.2** The test report shall contain statements that the packaging prepared as for carriage was tested in accordance with the appropriate requirements of this Chapter and that the use of other packaging methods or components may render it invalid. A copy of the test report shall be available to the competent authority.

## Chapter 6.4

### Requirements for the construction, testing and approval of packages and material of class 7

**6.4.1** (Reserved)

#### **6.4.2 General requirements**

**6.4.2.1** The package shall be so designed in relation to its mass, volume and shape that it can be easily and safely carried. In addition, the package shall be so designed that it can be properly secured in or on the wagon during carriage.

**6.4.2.2** The design shall be such that any lifting attachments on the package will not fail when used in the intended manner and that, if failure of the attachments should occur, the ability of the package to meet other requirements of RID would not be impaired. The design shall take account of appropriate safety factors to cover snatch lifting.

**6.4.2.3** Attachments and any other features on the outer surface of the package which could be used to lift it shall be designed either to support its mass in accordance with the requirements of 6.4.2.2 or shall be removable or otherwise rendered incapable of being used during carriage.

**6.4.2.4** As far as practicable, the packaging shall be so designed and finished that the external surfaces are free from protruding features and can be easily decontaminated.

**6.4.2.5** As far as practicable, the outer layer of the package shall be so designed as to prevent the collection and the retention of water.

**6.4.2.6** Any features added to the package at the time of carriage which are not part of the package shall not reduce its safety.

**6.4.2.7** The package shall be capable of withstanding the effects of any acceleration, vibration or vibration resonance which may arise under routine conditions of carriage without any deterioration in the effectiveness of the closing devices on the various receptacles or in the integrity of the package as a whole. In particular, nuts, bolts and other securing devices shall be so designed as to prevent them from becoming loose or being released unintentionally, even after repeated use.

**6.4.2.8** The materials of the packaging and any components or structures shall be physically and chemically compatible with each other and with the radioactive contents. Account shall be taken of their behaviour under irradiation.

**6.4.2.9** All valves through which the radioactive contents could otherwise escape shall be protected against unauthorized operation.

**6.4.2.10** The design of the package shall take into account ambient temperatures and pressures that are likely to be encountered in routine conditions of carriage.

**6.4.2.11** For radioactive material having other dangerous properties the package design shall take into account those properties; see 2.1.3.5.3 and 4.1.9.1.5.

**6.4.2.12** Manufacturers and subsequent distributors of packagings shall provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that packages as presented for carriage are capable of passing the applicable performance tests of this Chapter.

**6.4.3** (Reserved)

#### **6.4.4 Requirements for excepted packages**

An excepted package shall be designed to meet the requirements specified in 6.4.2.

#### **6.4.5 Requirements for Industrial packages**

**6.4.5.1** Type IP-1, Type IP-2 and Type IP-3 package shall meet the requirements specified in 6.4.2 and 6.4.7.2.

**6.4.5.2** A Type IP-2 package shall, if it were subjected to the tests specified in 6.4.15.4 and 6.4.15.5, prevent:  
(a) loss or dispersal of the radioactive contents; and  
(b) more than a 20% increase in the maximum radiation level at any external surface of the package.

**6.4.5.3** A Type IP-3 package shall meet all the requirements specified in 6.4.7.2 to 6.4.7.15.

**6.4.5.4 Alternative requirements for Type IP-2 and Type IP-3 packages****6.4.5.4.1** Packages may be used as Type IP-2 package provided that:

- (a) They satisfy the requirements of 6.4.5.1;
- (b) They are designed to satisfy the requirements prescribed for packing group I or II in Chapter 6.1; and
- (c) When subjected to the tests required for packing groups I or II in Chapter 6.1, they would prevent:
  - (i) loss or dispersal of the radioactive contents; and
  - (ii) more than a 20% increase in the maximum radiation level at any external surface of the package.

**6.4.5.4.2** Portable tanks may also be used as Type IP-2 or Type IP-3 package, provided that:

- (a) They satisfy the requirements of 6.4.5.1;
- (b) They are designed to satisfy the requirements prescribed in Chapter 6.7 and are capable of withstanding a test pressure of 265 kPa; and
- (c) They are designed so that any additional shielding which is provided shall be capable of withstanding the static and dynamic stresses resulting from handling and routine conditions of carriage and of preventing an increase of more than 20% in the maximum radiation level at any external surface of the portable tanks.

**6.4.5.4.3** Tanks, other than portable tanks, may also be used as Type IP-2 or Type IP-3 package for carrying LSA-I and LSA-II liquids and gases as prescribed in Table 4.1.9.2.4, provided that:

- (a) They satisfy the requirements of 6.4.5.1;
- (b) They are designed to satisfy the requirements prescribed in Chapter 6.8; and
- (c) They are designed so that any additional shielding which is provided shall be capable of withstanding the static and dynamic stresses resulting from handling and routine conditions of carriage and of preventing an increase of more than 20% in the maximum radiation level at any external surface of the tanks.

**6.4.5.4.4** Containers of a permanent enclosed character may also be used as Type IP-2 or Type IP-3 package, provided that:

- (a) The radioactive contents are restricted to solid materials;
- (b) They satisfy the requirements of 6.4.5.1; and
- (c) They are designed to conform to ISO 1496-1:1990: "Series 1 Containers – Specifications and Testing – Part 1: General Cargo Containers" excluding dimensions and ratings. They shall be designed such that if subjected to the tests prescribed in that document and the accelerations occurring during routine conditions of carriage they would prevent:
  - (i) loss or dispersal of the radioactive contents; and
  - (ii) more than a 20% increase in the maximum radiation level at any external surface of the containers.

**6.4.5.4.5** Metal intermediate bulk containers may also be used as Type IP-2 or Type IP-3 package, provided that:

- (a) They satisfy the requirements of 6.4.5.1; and
- (b) They are designed to satisfy the requirements prescribed in Chapter 6.5 for packing group I or II, and if they were subjected to the tests prescribed in that Chapter, but with the drop test conducted in the most damaging orientation, they would prevent:
  - (i) loss or dispersal of the radioactive contents; and
  - (ii) more than a 20% increase in the maximum radiation level at any external surface of the intermediate bulk container.

**6.4.6 Requirements for packages containing uranium hexafluoride****6.4.6.1** Packages designed to contain uranium hexafluoride shall meet the requirements prescribed elsewhere in RID which pertain to the radioactive and fissile properties of the material. Except as allowed in 6.4.6.4, uranium hexafluoride in quantities of 0.1 kg or more shall also be packaged and carried in accordance with the provisions of ISO 7195:1993 "Packaging of uranium hexafluoride (UF<sub>6</sub>) for transport", and the requirements of 6.4.6.2 and 6.4.6.3.**6.4.6.2** Each package designed to contain 0.1 kg or more of uranium hexafluoride shall be designed so that it would meet the following requirements:

- (a) Withstand without leakage and without unacceptable stress, as specified in ISO 7195:1993, the structural test as specified in 6.4.21.5;
- (b) Withstand without loss or dispersal of the uranium hexafluoride the free drop test specified in 6.4.15.4; and
- (c) Withstand without rupture of the containment system the thermal test specified in 6.4.17.3.

- 6.4.6.3** Packages designed to contain 0.1 kg or more of uranium hexafluoride shall not be provided with pressure relief devices.
- 6.4.6.4** Subject to the approval of the competent authority, packages designed to contain 0.1 kg or more of uranium hexafluoride may be carried if:
- (a) The packages are designed to international or national standards other than ISO 7195:1993 provided an equivalent level of safety is maintained;
  - (b) The packages are designed to withstand without leakage and without unacceptable stress a test pressure of less than 2.76 MPa as specified in 6.4.21.5; or
  - (c) For packages designed to contain 9 000 kg or more of uranium hexafluoride, the packages do not meet the requirement of 6.4.6.2 (c).

In all other respects the requirements specified in 6.4.6.1 to 6.4.6.3 shall be satisfied.

**6.4.7 Requirements for Type A packages**

- 6.4.7.1** Type A packages shall be designed to meet the general requirements of 6.4.2 and of 6.4.7.2 to 6.4.7.17.
- 6.4.7.2** The smallest overall external dimension of the package shall not be less than 10 cm.
- 6.4.7.3** The outside of the package shall incorporate a feature such as a seal, which is not readily breakable and which, while intact, will be evidence that it has not been opened.
- 6.4.7.4** Any tie-down attachments on the package shall be so designed that, under normal and accident conditions of carriage, the forces in those attachments shall not impair the ability of the package to meet the requirements of RID.
- 6.4.7.5** The design of the package shall take into account temperatures ranging from  $-40^{\circ}\text{C}$  to  $+70^{\circ}\text{C}$  for the components of the packaging. Attention shall be given to freezing temperatures for liquids and to the potential degradation of packaging materials within the given temperature range.
- 6.4.7.6** The design and manufacturing techniques shall be in accordance with national or international standards, or other requirements, acceptable to the competent authority.
- 6.4.7.7** The design shall include a containment system securely closed by a positive fastening device which cannot be opened unintentionally or by a pressure which may arise within the package.
- 6.4.7.8** Special form radioactive material may be considered as a component of the containment system.
- 6.4.7.9** If the containment system forms a separate unit of the package, it shall be capable of being securely closed by a positive fastening device which is independent of any other part of the packaging.
- 6.4.7.10** The design of any component of the containment system shall take into account, where applicable, the radiolytic decomposition of liquids and other vulnerable materials and the generation of gas by chemical reaction and radiolysis.
- 6.4.7.11** The containment system shall retain its radioactive contents under a reduction of ambient pressure to 60 kPa.
- 6.4.7.12** All valves, other than pressure relief valves, shall be provided with an enclosure to retain any leakage from the valve.
- 6.4.7.13** A radiation shield which encloses a component of the package specified as a part of the containment system shall be so designed as to prevent the unintentional release of that component from the shield. Where the radiation shield and such component within it form a separate unit, the radiation shield shall be capable of being securely closed by a positive fastening device which is independent of any other packaging structure.
- 6.4.7.14** A package shall be so designed that if it were subjected to the tests specified in 6.4.15, it would prevent:
- (a) loss or dispersal of the radioactive contents; and
  - (b) more than a 20% increase in the maximum radiation level at any external surface of the package.
- 6.4.7.15** The design of a package intended for liquid radioactive material shall make provision for ullage to accommodate variations in the temperature of the contents, dynamic effects and filling dynamics.

**Type A packages to contain liquids**

- 6.4.7.16** A Type A package designed to contain liquid radioactive material shall, in addition:
- (a) Be adequate to meet the conditions specified in 6.4.7.14 (a) above if the package is subjected to the tests specified in 6.4.16; and

## (b) Either

- (i) be provided with sufficient absorbent material to absorb twice the volume of the liquid contents. Such absorbent material shall be suitably positioned so as to contact the liquid in the event of leakage; or
- (ii) be provided with a containment system composed of primary inner and secondary outer containment components designed to ensure retention of the liquid contents, within the secondary outer containment components, even if the primary inner components leak.

**Type A packages to contain gas**

**6.4.7.17** A package designed for gases shall prevent loss or dispersal of the radioactive contents if the package were subjected to the tests specified in 6.4.16. A Type A package designed for tritium gas or for noble gases shall be excepted from this requirement.

**6.4.8 Requirements for Type B(U) packages**

**6.4.8.1** Type B(U) packages shall be designed to meet the requirements specified in 6.4.2, and of 6.4.7.2 to 6.4.7.15, except as specified in 6.4.7.14 (a), and, in addition, the requirements specified in 6.4.8.2 to 6.4.8.15.

**6.4.8.2** A package shall be so designed that, under the ambient conditions specified in 6.4.8.5 and 6.4.8.6 heat generated within the package by the radioactive contents shall not, under normal conditions of carriage, as demonstrated by the tests in 6.4.15, adversely affect the package in such a way that it would fail to meet the applicable requirements for containment and shielding if left unattended for a period of one week. Particular attention shall be paid to the effects of heat, which may:

- (a) Alter the arrangement, the geometrical form or the physical state of the radioactive contents or, if the radioactive material is enclosed in a can or receptacle (for example, clad fuel elements), cause the can, receptacle or radioactive material to deform or melt; or
- (b) Lessen the efficiency of the packaging through differential thermal expansion or cracking or melting of the radiation shielding material; or
- (c) In combination with moisture, accelerate corrosion.

**6.4.8.3** A package shall be so designed that, under the ambient condition specified in 6.4.8.5 and in the absence of insulation, the temperature of the accessible surfaces of a package shall not exceed 50 °C, unless the package is carried under exclusive use.

**6.4.8.4** The maximum temperature of any surface readily accessible during carriage of a package under exclusive use shall not exceed 85 °C in the absence of insulation under the ambient conditions specified in 6.4.8.5. Account may be taken of barriers or screens intended to give protection to persons without the need for the barriers or screens being subject to any test.

**6.4.8.5** The ambient temperature shall be assumed to be 38 °C.

**6.4.8.6** The solar insolation conditions shall be assumed to be as specified in Table 6.4.8.6.

**Table 6.4.8.6: Insolation data**

Case	Form and location of surface	Insulation for 12 hours per day (W/m <sup>2</sup> )
1	Flat surfaces carried horizontally-downward facing	0
2	Flat surfaces carried horizontally-upward facing	800
3	Surfaces carried vertically	200 <sup>(a)</sup>
4	Other downward facing (not horizontal) surfaces	200 <sup>(a)</sup>
5	All other surfaces	400 <sup>(a)</sup>

<sup>(a)</sup> Alternatively, a sine function may be used, with an absorption coefficient adopted and the effects of possible reflection from neighbouring objects neglected.

**6.4.8.7** A package which includes thermal protection for the purpose of satisfying the requirements of the thermal test specified in 6.4.17.3 shall be so designed that such protection will remain effective if the package is subjected to the tests specified in 6.4.15 and 6.4.17.2 (a) and (b) or 6.4.17.2 (b) and (c), as appropriate. Any such protection on the exterior of the package shall not be rendered ineffective by ripping, cutting, skidding, abrasion or rough handling.

- 6.4.8.8** A package shall be so designed that, if it were subjected to:
- (a) The tests specified in 6.4.15, it would restrict the loss of radioactive contents to not more than  $10^{-6}$   $A_2$  per hour; and
  - (b) The tests specified in 6.4.17.1, 6.4.17.2 (b), 6.4.17.3, and 6.4.17.4 and the tests in
    - (i) 6.4.17.2 (c), when the package has a mass not greater than 500 kg, an overall density not greater than  $1\,000\text{ kg/m}^3$  based on the external dimensions, and radioactive contents greater than  $1\,000\text{ }A_2$  not as special form radioactive material, or
    - (ii) 6.4.17.2 (a), for all other packages,it would meet the following requirements:
    - retain sufficient shielding to ensure that the radiation level at 1 m from the surface of the package would not exceed 10 mSv/h with the maximum radioactive contents which the package is designed to contain; and
    - restrict the accumulated loss of radioactive contents in a period of one week to not more than  $10\text{ }A_2$  for krypton-85 and not more than  $A_2$  for all other radionuclides.

Where mixtures of different radionuclides are present, the provisions of 2.2.7.2.2.4 to 2.2.7.2.2.6 shall apply except that for krypton-85 an effective  $A_2(i)$  value equal to  $10\text{ }A_2$  may be used. For case (a) above, the assessment shall take into account the external contamination limits of 4.1.9.1.2.

- 6.4.8.9** A package for radioactive contents with activity greater than  $10^5\text{ }A_2$  shall be so designed that if it were subjected to the enhanced water immersion test specified in 6.4.18, there would be no rupture of the containment system.
- 6.4.8.10** Compliance with the permitted activity release limits shall depend neither upon filters nor upon a mechanical cooling system.
- 6.4.8.11** A package shall not include a pressure relief system from the containment system which would allow the release of radioactive material to the environment under the conditions of the tests specified in 6.4.15 and 6.4.17.
- 6.4.8.12** A package shall be so designed that if it were at the maximum normal operating pressure and it were subjected to the tests specified in 6.4.15 and 6.4.17, the level of strains in the containment system would not attain values which would adversely affect the package in such a way that it would fail to meet the applicable requirements.
- 6.4.8.13** A package shall not have a maximum normal operating pressure in excess of a gauge pressure of 700 kPa.
- 6.4.8.14** A package containing low dispersible radioactive material shall be so designed that any features added to the low dispersible radioactive material that are not part of it, or any internal components of the packaging shall not adversely affect the performance of the low dispersible radioactive material.
- 6.4.8.15** A package shall be designed for an ambient temperature range from  $-40\text{ }^\circ\text{C}$  to  $+38\text{ }^\circ\text{C}$ .

**6.4.9 Requirements for Type B(M) packages**

- 6.4.9.1** Type B(M) packages shall meet the requirements for Type B(U) packages specified in 6.4.8.1, except that for packages to be carried solely within a specified country or solely between specified countries, conditions other than those given in 6.4.7.5, 6.4.8.5, 6.4.8.6, and 6.4.8.9 to 6.4.8.15 above may be assumed with the approval of the competent authorities of these countries. Notwithstanding, the requirements for Type B(U) packages specified in 6.4.8.9 to 6.4.8.15 shall be met as far as practicable.
- 6.4.9.2** Intermittent venting of Type B(M) packages may be permitted during carriage, provided that the operational controls for venting are acceptable to the relevant competent authorities.

**6.4.10 Requirements for Type C packages**

- 6.4.10.1** Type C packages shall be designed to meet the requirements specified in 6.4.2 and of 6.4.7.2 to 6.4.7.15, except as specified in 6.4.7.14 (a), and of the requirements specified in 6.4.8.2 to 6.4.8.6, 6.4.8.10 to 6.4.8.15, and, in addition, of 6.4.10.2 to 6.4.10.4.
- 6.4.10.2** A package shall be capable of meeting the assessment criteria prescribed for tests in 6.4.8.8 (b) and 6.4.8.12 after burial in an environment defined by a thermal conductivity of  $0.33\text{ W}\cdot\text{m}^{-1}\cdot\text{K}^{-1}$  and a temperature of  $38\text{ }^\circ\text{C}$  in the steady state. Initial conditions for the assessment shall assume that any thermal insulation of the package remains intact, the package is at the maximum normal operating pressure and the ambient temperature is  $38\text{ }^\circ\text{C}$ .

- 6.4.10.3** A package shall be so designed that, if it were at the maximum normal operating pressure and subjected to:
- (a) The tests specified in 6.4.15, it would restrict the loss of radioactive contents to not more than  $10^{-6}$   $A_2$  per hour; and
  - (b) The test sequences in 6.4.20.1, it would meet the following requirements:
    - (i) retain sufficient shielding to ensure that the radiation level at 1 m from the surface of the package would not exceed 10 mSv/h with the maximum radioactive contents which the package is designed to contain; and
    - (ii) restrict the accumulated loss of radioactive contents in a period of 1 week to not more than 10  $A_2$  for krypton-85 and not more than  $A_2$  for all other radionuclides.

Where mixtures of different radionuclides are present, the provisions of 2.2.7.2.4 to 2.2.7.2.6 shall apply except that for krypton-85 an effective  $A_2(i)$  value equal to 10  $A_2$  may be used. For case (a) above, the assessment shall take into account the external contamination limits of 4.1.9.1.2.

- 6.4.10.4** A package shall be so designed that there will be no rupture of the containment system following performance of the enhanced water immersion test specified in 6.4.18.

**6.4.11 Requirements for packages containing fissile material**

- 6.4.11.1** Fissile material shall be carried so as to:

- (a) Maintain sub-criticality during normal and accident conditions of carriage; in particular, the following contingencies shall be considered:
  - (i) water leaking into or out of packages;
  - (ii) the loss of efficiency of built-in neutron absorbers or moderators;
  - (iii) rearrangement of the contents either within the package or as a result of loss from the package;
  - (iv) reduction of spaces within or between packages;
  - (v) packages becoming immersed in water or buried in snow; and
  - (vi) temperature changes; and
- (b) Meet the requirements:
  - (i) of 6.4.7.2 for packages containing fissile material;
  - (ii) prescribed elsewhere in RID which pertain to the radioactive properties of the material; and
  - (iii) specified in 6.4.11.3 to 6.4.11.12, unless excepted by 6.4.11.2.

- 6.4.11.2** Fissile material meeting one of the provisions (a) to (d) of 2.2.7.2.3.5 is excepted from the requirement to be carried in packages that comply with 6.4.11.3 to 6.4.11.12 as well as the other requirements of RID that apply to fissile material. Only one type of exception is allowed per consignment.

- 6.4.11.3** Where the chemical or physical form, isotopic composition, mass or concentration, moderation ratio or density, or geometric configuration is not known, the assessments of 6.4.11.7 to 6.4.11.12 shall be performed assuming that each parameter that is not known has the value which gives the maximum neutron multiplication consistent with the known conditions and parameters in these assessments.

- 6.4.11.4** For irradiated nuclear fuel the assessments of 6.4.11.7 to 6.4.11.12 shall be based on an isotopic composition demonstrated to provide:

- (a) The maximum neutron multiplication during the irradiation history; or
- (b) A conservative estimate of the neutron multiplication for the package assessments. After irradiation but prior to shipment, a measurement shall be performed to confirm the conservatism of the isotopic composition.

- 6.4.11.5** The package, after being subjected to the tests specified in 6.4.15, must prevent the entry of a 10 cm cube.

- 6.4.11.6** The package shall be designed for an ambient temperature range of  $-40\text{ }^{\circ}\text{C}$  to  $+38\text{ }^{\circ}\text{C}$  unless the competent authority specifies otherwise in the certificate of approval for the package design.

- 6.4.11.7** For a package in isolation, it shall be assumed that water can leak into or out of all void spaces of the package, including those within the containment system. However, if the design incorporates special features to prevent such leakage of water into or out of certain void spaces, even as a result of error, absence of leakage may be assumed in respect of those void spaces. Special features shall include the following:

- (a) Multiple high standard water barriers, each of which would remain watertight if the package were subject to the tests prescribed in 6.4.11.12 (b), a high degree of quality control in the manufacture, maintenance and repair of packagings and tests to demonstrate the closure of each package before each shipment; or

(b) For packages containing uranium hexafluoride only, with maximum enrichment of 5 mass percent uranium-235:

- (i) packages where, following the tests prescribed in 6.4.11.12 (b), there is no physical contact between the valve and any other component of the packaging other than at its original point of attachment and where, in addition, following the test prescribed in 6.4.17.3 the valves remain leak-tight; and
- (ii) a high degree of quality control in the manufacture, maintenance and repair of packagings coupled with tests to demonstrate closure of each package before each shipment.

**6.4.11.8** It shall be assumed that the confinement system shall be closely reflected by at least 20 cm of water or such greater reflection as may additionally be provided by the surrounding material of the packaging. However, when it can be demonstrated that the confinement system remains within the packaging following the tests prescribed in 6.4.11.12 (b), close reflection of the package by at least 20 cm of water may be assumed in 6.4.11.9 (c).

**6.4.11.9** The package shall be subcritical under the conditions of 6.4.11.7 and 6.4.11.8 with the package conditions that result in the maximum neutron multiplication consistent with:

- (a) Routine conditions of carriage (incident free);
- (b) The tests specified in 6.4.11.11 (b);
- (c) The tests specified in 6.4.11.12 (b).

**6.4.11.10** (Reserved)

**6.4.11.11** For normal conditions of carriage a number "N" shall be derived, such that five times "N" packages shall be subcritical for the arrangement and package conditions that provide the maximum neutron multiplication consistent with the following:

- (a) There shall not be anything between the packages, and the package arrangement shall be reflected on all sides by at least 20 cm of water; and
- (b) The state of the packages shall be their assessed or demonstrated condition if they had been subjected to the tests specified in 6.4.15.

**6.4.11.12** For accident conditions of carriage a number "N" shall be derived, such that two times "N" packages shall be subcritical for the arrangement and package conditions that provide the maximum neutron multiplication consistent with the following:

- (a) Hydrogenous moderation between packages, and the package arrangement reflected on all sides by at least 20 cm of water; and
- (b) The tests specified in 6.4.15 followed by whichever of the following is the more limiting:
  - (i) the tests specified in 6.4.17.2 (b) and, either 6.4.17.2 (c) for packages having a mass not greater than 500 kg and an overall density not greater than 1 000 kg/m<sup>3</sup> based on the external dimensions, or 6.4.17.2 (a) for all other packages; followed by the test specified in 6.4.17.3 and completed by the tests specified in 6.4.19.1 to 6.4.19.3; or
  - (ii) the test specified in 6.4.17.4; and
- (c) Where any part of the fissile material escapes from the containment system following the tests specified in 6.4.11.12 (b), it shall be assumed that fissile material escapes from each package in the array and all of the fissile material shall be arranged in the configuration and moderation that results in the maximum neutron multiplication with close reflection by at least 20 cm of water.

**6.4.11.13** The criticality safety index (CSI) for packages containing fissile material shall be obtained by dividing the number 50 by the smaller of the two values of "N" derived in 6.4.11.11 and 6.4.11.12 (i.e.  $CSI = 50/N$ ). The value of the criticality safety index may be zero, provided that an unlimited number of packages is subcritical (i.e. N is effectively equal to infinity in both cases).

#### **6.4.12 Test procedures and demonstration of compliance**

**6.4.12.1** Demonstration of compliance with the performance standards required in 2.2.7.2.3.1.3, 2.2.7.2.3.1.4, 2.2.7.2.3.3.1, 2.2.7.2.3.3.2, 2.2.7.2.3.4.1, 2.2.7.2.3.4.2, and 6.4.2 to 6.4.11 must be accomplished by any of the methods listed below or by a combination thereof:

- (a) Performance of tests with specimens representing LSA-III material, or special form radioactive material, or low dispersible radioactive material or with prototypes or samples of the packaging, where the contents of the specimen or the packaging for the tests shall simulate as closely as practicable the expected range of radioactive contents and the specimen or packaging to be tested shall be prepared as presented for carriage;
- (b) Reference to previous satisfactory demonstrations of a sufficiently similar nature;

- (c) Performance of tests with models of appropriate scale incorporating those features which are significant with respect to the item under investigation when engineering experience has shown results of such tests to be suitable for design purposes. When a scale model is used, the need for adjusting certain test parameters, such as penetrator diameter or compressive load, shall be taken into account;
- (d) Calculation, or reasoned argument, when the calculation procedures and parameters are generally agreed to be reliable or conservative.

**6.4.12.2** After the specimen, prototype or sample has been subjected to the tests, appropriate methods of assessment shall be used to assure that the requirements for the test procedures have been fulfilled in compliance with the performance and acceptance standards prescribed in 2.2.7.2.3.1.3, 2.2.7.2.3.1.4, 2.2.7.2.3.3.1, 2.2.7.2.3.3.2, 2.2.7.2.3.4.1, 2.2.7.2.3.4.2, and 6.4.2 to 6.4.11.

**6.4.12.3** All specimens shall be inspected before testing in order to identify and record faults or damage including the following:

- (a) Divergence from the design;
- (b) Defects in manufacture;
- (c) Corrosion or other deterioration; and
- (d) Distortion of features.

The containment system of the package shall be clearly specified. The external features of the specimen shall be clearly identified so that reference may be made simply and clearly to any part of such specimen.

**6.4.13 Testing the integrity of the containment system and shielding and evaluating criticality safety**

After each of the applicable tests specified in 6.4.15 to 6.4.21:

- (a) Faults and damage shall be identified and recorded;
- (b) It shall be determined whether the integrity of the containment system and shielding has been retained to the extent required in 6.4.2 to 6.4.11 for the package under test; and
- (c) For packages containing fissile material, it shall be determined whether the assumptions and conditions used in the assessments required by 6.4.11.1 to 6.4.11.12 for one or more packages are valid.

**6.4.14 Target for drop tests**

The target for the drop tests specified in 2.2.7.2.3.3.5 (a), 6.4.15.4, 6.4.16 (a), 6.4.17.2 and 6.4.20.2 shall be a flat, horizontal surface of such a character that any increase in its resistance to displacement or deformation upon impact by the specimen would not significantly increase the damage to the specimen.

**6.4.15 Tests for demonstrating ability to withstand normal conditions of carriage**

**6.4.15.1** The tests are: the water spray test, the free drop test, the stacking test and the penetration test. Specimens of the package shall be subjected to the free drop test, the stacking test and the penetration test, preceded in each case by the water spray test. One specimen may be used for all the tests, provided that the requirements of 6.4.15.2 are fulfilled.

**6.4.15.2** The time interval between the conclusion of the water spray test and the succeeding test shall be such that the water has soaked in to the maximum extent, without appreciable drying of the exterior of the specimen. In the absence of any evidence to the contrary, this interval shall be taken to be two hours if the water spray is applied from four directions simultaneously. No time interval shall elapse, however, if the water spray is applied from each of the four directions consecutively.

**6.4.15.3** Water spray test: The specimen shall be subjected to a water spray test that simulates exposure to rainfall of approximately 5 cm per hour for at least one hour.

**6.4.15.4** Free drop test: The specimen shall drop onto the target so as to suffer maximum damage in respect of the safety features to be tested.

- (a) The height of drop measured from the lowest point of the specimen to the upper surface of the target shall be not less than the distance specified in Table 6.4.15.4 for the applicable mass. The target shall be as defined in 6.4.14;
- (b) For rectangular fibreboard or wood packages not exceeding a mass of 50 kg, a separate specimen shall be subjected to a free drop onto each corner from a height of 0.3 m;
- (c) For cylindrical fibreboard packages not exceeding a mass of 100 kg, a separate specimen shall be subjected to a free drop onto each of the quarters of each rim from a height of 0.3 m.

**Table 6.4.15.4: Free drop distance for testing packages to normal conditions of carriage**

Package mass (kg)			Free drop distance (m)
	Package mass	< 5000	1,2
5000 ≤	Package mass	< 10000	0,9
10000 ≤	Package mass	< 15000	0,6
15000 ≤	Package mass		0,3

**6.4.15.5** Stacking test: Unless the shape of the packaging effectively prevents stacking, the specimen shall be subjected, for a period of 24 h, to a compressive load equal to the greater of the following:

- (a) The equivalent of 5 times the mass of the actual package; and
- (b) The equivalent of 13 kPa multiplied by the vertically projected area of the package.

The load shall be applied uniformly to two opposite sides of the specimen, one of which shall be the base on which the package would typically rest.

**6.4.15.6** Penetration test: The specimen shall be placed on a rigid, flat, horizontal surface which will not move significantly while the test is being carried out.

- (a) A bar of 3.2 cm in diameter with a hemispherical end and a mass of 6 kg shall be dropped and directed to fall, with its longitudinal axis vertical, onto the centre of the weakest part of the specimen, so that, if it penetrates sufficiently far, it will hit the containment system. The bar shall not be significantly deformed by the test performance;
- (b) The height of drop of the bar measured from its lower end to the intended point of impact on the upper surface of the specimen shall be 1 m.

**6.4.16 Additional tests for Type A packages designed for liquids and gases**

A specimen or separate specimens shall be subjected to each of the following tests unless it can be demonstrated that one test is more severe for the specimen in question than the other, in which case one specimen shall be subjected to the more severe test.

- (a) Free drop test: The specimen shall drop onto the target so as to suffer the maximum damage in respect of containment. The height of the drop measured from the lowest part of the specimen to the upper surface of the target shall be 9 m. The target shall be as defined in 6.4.14;
- (b) Penetration test: The specimen shall be subjected to the test specified in 6.4.15.6 except that the height of drop shall be increased to 1.7 m from the 1 m specified in 6.4.15.6 (b).

**6.4.17 Tests for demonstrating ability to withstand accident conditions in carriage**

**6.4.17.1** The specimen shall be subjected to the cumulative effects of the tests specified in 6.4.17.2 and 6.4.17.3, in that order. Following these tests, either this specimen or a separate specimen shall be subjected to the effect(s) of the water immersion test(s) as specified in 6.4.17.4 and, if applicable, 6.4.18.

**6.4.17.2** Mechanical test: The mechanical test consists of three different drop tests. Each specimen shall be subjected to the applicable drops as specified in 6.4.8.8 or 6.4.11.12. The order in which the specimen is subjected to the drops shall be such that, on completion of the mechanical test, the specimen shall have suffered such damage as will lead to the maximum damage in the thermal test which follows.

- (a) For drop I, the specimen shall drop onto the target so as to suffer the maximum damage, and the height of the drop measured from the lowest point of the specimen to the upper surface of the target shall be 9 m. The target shall be as defined in 6.4.14;
- (b) For drop II, the specimen shall drop so as to suffer the maximum damage onto a bar rigidly mounted perpendicularly on the target. The height of the drop measured from the intended point of impact of the specimen to the upper surface of the bar shall be 1 m. The bar shall be of solid mild steel of circular section, (15.0 cm ± 0.5 cm) in diameter and 20 cm long unless a longer bar would cause greater damage, in which case a bar of sufficient length to cause maximum damage shall be used. The upper end of the bar shall be flat and horizontal with its edge rounded off to a radius of not more than 6 mm. The target on which the bar is mounted shall be as described in 6.4.14;
- (c) For drop III, the specimen shall be subjected to a dynamic crush test by positioning the specimen on the target so as to suffer maximum damage by the drop of a 500 kg mass from 9 m onto the specimen. The mass shall consist of a solid mild steel plate 1 m by 1 m and shall fall in a horizontal attitude. The height of the drop shall be measured from the underside of the plate to the highest point of the specimen. The target on which the specimen rests shall be as defined in 6.4.14.

- 6.4.17.3** Thermal test: The specimen shall be in thermal equilibrium under conditions of an ambient temperature of 38 °C, subject to the solar insolation conditions specified in Table 6.4.8.6 and subject to the design maximum rate of internal heat generation within the package from the radioactive contents. Alternatively, any of these parameters are allowed to have different values prior to and during the test, providing due account is taken of them in the subsequent assessment of package response.

The thermal test shall then consist of:

- (a) Exposure of a specimen for a period of 30 minutes to a thermal environment which provides a heat flux at least equivalent to that of a hydrocarbon fuel/air fire in sufficiently quiescent ambient conditions to give a minimum average flame emissivity coefficient of 0.9 and an average temperature of at least 800 °C, fully engulfing the specimen, with a surface absorptivity coefficient of 0.8 or that value which the package may be demonstrated to possess if exposed to the fire specified, followed by,
- (b) Exposure of the specimen to an ambient temperature of 38 °C, subject to the solar insolation conditions specified in Table 6.4.8.6 and subject to the design maximum rate of internal heat generation within the package by the radioactive contents for a sufficient period to ensure that temperatures in the specimen are everywhere decreasing and/or are approaching initial steady state conditions. Alternatively, any of these parameters are allowed to have different values following cessation of heating, providing due account is taken of them in the subsequent assessment of package response.

During and following the test the specimen shall not be artificially cooled and any combustion of materials of the specimen shall be permitted to proceed naturally.

- 6.4.17.4** Water immersion test: The specimen shall be immersed under a head of water of at least 15 m for a period of not less than eight hours in the attitude which will lead to maximum damage. For demonstration purposes, an external gauge pressure of at least 150 kPa shall be considered to meet these conditions.

**6.4.18 Enhanced water immersion test for Type B(U) and Type B(M) packages containing more than 10<sup>5</sup> A<sub>2</sub> and Type C packages**

Enhanced water immersion test: The specimen shall be immersed under a head of water of at least 200 m for a period of not less than one hour. For demonstration purposes, an external gauge pressure of at least 2 MPa shall be considered to meet these conditions.

**6.4.19 Water leakage test for packages containing fissile material**

- 6.4.19.1** Packages for which water in-leakage or out-leakage to the extent which results in greatest reactivity has been assumed for purposes of assessment under 6.4.11.7 to 6.4.11.12 shall be excepted from the test.

- 6.4.19.2** Before the specimen is subjected to the water leakage test specified below, it shall be subjected to the tests in 6.4.17.2 (b), and either 6.4.17.2 (a) or (c) as required by 6.4.11.12, and the test specified in 6.4.17.3.

- 6.4.19.3** The specimen shall be immersed under a head of water of at least 0.9 m for a period of not less than 8 hours and in the attitude for which maximum leakage is expected.

**6.4.20 Tests for Type C packages**

- 6.4.20.1** Specimens shall be subjected to the effects of each of the following test sequences in the orders specified:

- (a) The tests specified in 6.4.17.2 (a), 6.4.17.2 (c), 6.4.20.2 and 6.4.20.3; and
- (b) The test specified in 6.4.20.4.

Separate specimens are allowed to be used for each of the sequences (a) and (b).

- 6.4.20.2** Puncture/tearing test: The specimen shall be subjected to the damaging effects of a solid probe made of mild steel. The orientation of the probe to the surface of the specimen shall be as to cause maximum damage at the conclusion of the test sequence specified in 6.4.20.1 (a).

- (a) The specimen, representing a package having a mass less than 250 kg, shall be placed on a target and subjected to a probe having a mass of 250 kg falling from a height of 3 m above the intended impact point. For this test the probe shall be a 20 cm diameter cylindrical bar with the striking end forming a frustum of a right circular cone with the following dimensions: 30 cm height and 2.5 cm in diameter at the top with its edge rounded off to a radius of not more than 6 mm. The target on which the specimen is placed shall be as specified in 6.4.14;

- (b) For packages having a mass of 250 kg or more, the base of the probe shall be placed on a target and the specimen dropped onto the probe. The height of the drop, measured from the point of impact with the specimen to the upper surface of the probe shall be 3 m. For this test the probe shall have the same properties and dimensions as specified in (a) above, except that the length and mass of the probe shall be such as to incur maximum damage to the specimen. The target on which the base of the probe is placed shall be as specified in 6.4.14.

- 6.4.20.3** Enhanced thermal test: The conditions for this test shall be as specified in 6.4.17.3, except that the exposure to the thermal environment shall be for a period of 60 minutes.

**6.4.20.4** Impact test: The specimen shall be subject to an impact on a target at a velocity of not less than 90 m/s, at such an orientation as to suffer maximum damage. The target shall be as defined in 6.4.14, except that the target surface may be at any orientation as long as the surface is normal to the specimen path.

**6.4.21 Inspections for packagings designed to contain 0.1 kg or more of uranium hexafluoride**

**6.4.21.1** Every manufactured packaging and its service and structural equipment shall, either jointly or separately, undergo an inspection initially before being put into service and periodically thereafter. These inspections shall be performed and certified by agreement with the competent authority.

**6.4.21.2** The initial inspection shall consist of a check of the design characteristics, a structural test, a leakproofness test, a water capacity test and a check of satisfactory operation of the service equipment.

**6.4.21.3** The periodic inspections shall consist of a visual examination, a structural test, a leakproofness test and a check of satisfactory operation of the service equipment. The maximum intervals for periodic inspections shall be five years. Packagings which have not been inspected within this five-year period shall be examined before carriage in accordance with a programme approved by the competent authority. They shall not be refilled before completion of the full programme for periodic inspections.

**6.4.21.4** The check of design characteristics shall demonstrate compliance with the design type specifications and the manufacturing programme.

**6.4.21.5** For the initial structural test, packagings designed to contain 0.1 kg or more of uranium hexafluoride shall be tested hydraulically at an internal pressure of at least 1.38 MPa but, when the test pressure is less than 2.76 MPa, the design shall require multilateral approval. For retesting packagings, any other equivalent non-destructive testing may be applied subject to multilateral approval.

**6.4.21.6** The leakproofness test shall be performed in accordance with a procedure which is capable of indicating leakages in the containment system with a sensitivity of 0.1 Pa·l/s ( $10^{-6}$  bar·l/s).

**6.4.21.7** The water capacity of the packagings shall be established with an accuracy of  $\pm 0.25\%$  at a reference temperature of 15 °C. The volume shall be stated on the plate described in 6.4.21.8.

**6.4.21.8** A plate made of non-corroding metal shall be durably attached to every packaging in a readily accessible place. The method of attaching the plate must not impair the strength of the packaging. The following particulars, at least, shall be marked on the plate by stamping or by any other equivalent method:

- Approval number;
- Manufacturer's serial number;
- Maximum working pressure (gauge pressure);
- Test pressure (gauge pressure);
- Contents: uranium hexafluoride;
- Capacity in litres;
- Maximum permissible filling mass of uranium hexafluoride;
- Tare mass;
- Date (month, year) of the initial test and the most recent periodic test;
- Stamp of the expert who performed the tests.

**6.4.22 Approvals of package designs and materials**

**6.4.22.1** The approval of designs for packages containing 0.1 kg or more of uranium hexafluoride requires that:

- (a) Each design that meets the requirements of 6.4.6.4 shall require multilateral approval;
- (b) Each design that meets the requirements of 6.4.6.1 to 6.4.6.3 shall require unilateral approval by the competent authority of the country of origin of the design, unless multilateral approval is otherwise required by RID.

**6.4.22.2** Each Type B(U) and Type C package design shall require unilateral approval, except that:

- (a) A package design for fissile material, which is also subject to 6.4.22.4, 6.4.23.7, and 5.1.5.2.1 shall require multilateral approval; and
- (b) A Type B(U) package design for low dispersible radioactive material shall require multilateral approval.

**6.4.22.3** Each Type B(M) package design, including those for fissile material which are also subject to the requirements of 6.4.22.4, 6.4.23.7, and 5.1.5.2.1 and those for low dispersible radioactive material, shall require multilateral approval.

**6.4.22.4** Each package design for fissile material which is not excepted according to 6.4.11.2 from the requirements that apply specifically to packages containing fissile material shall require multilateral approval.

- 6.4.22.5** The design for special form radioactive material shall require unilateral approval. The design for low dispersible radioactive material shall require multilateral approval (see also 6.4.23.8).
- 6.4.22.6** Any design that requires unilateral approval originating in a COTIF member state shall be approved by the competent authority of this country; if the country where the package has been designed is not a COTIF member state, carriage is possible on condition that:
- (a) a certificate has been supplied by this country, proving that the package satisfies the technical requirements of RID, and that this certificate is countersigned by the competent authority of the first COTIF member state reached by the consignment;
  - (b) if no certificate and no existing package design approval by a COTIF member state has been supplied, the package design is approved by the competent authority of the first COTIF member state reached by the consignment.
- 6.4.22.7** For designs approved under the transitional measures see 1.6.6.
- 6.4.23 Applications and approvals for radioactive material carriage**
- 6.4.23.1** (Reserved)
- 6.4.23.2** An application for shipment approval shall include:
- (a) The period of time, related to the shipment, for which the approval is sought;
  - (b) The actual radioactive contents, the expected modes of carriage, the type of wagon, and the probable or proposed route; and
  - (c) The details of how the precautions and administrative or operational controls, referred to in the package design approval certificates issued under 5.1.5.2.1, are to be put into effect.
- 6.4.23.3** An application for approval of shipments under special arrangement shall include all the information necessary to satisfy the competent authority that the overall level of safety in carriage is at least equivalent to that which would be provided if all the applicable requirements of RID had been met.
- The application shall also include:
- (a) A statement of the respects in which, and of the reasons why, the shipment cannot be made in full accordance with the applicable requirements of RID; and
  - (b) A statement of any special precautions or special administrative or operational controls which are to be employed during carriage to compensate for the failure to meet the applicable requirements of RID.
- 6.4.23.4** An application for approval of Type B(U) or Type C package design shall include:
- (a) A detailed description of the proposed radioactive contents with reference to their physical and chemical states and the nature of the radiation emitted;
  - (b) A detailed statement of the design, including complete engineering drawings and schedules of materials and methods of manufacture;
  - (c) A statement of the tests which have been done and their results, or evidence based on calculative methods or other evidence that the design is adequate to meet the applicable requirements;
  - (d) The proposed operating and maintenance instructions for the use of the packaging;
  - (e) If the package is designed to have a maximum normal operating pressure in excess of 100 kPa gauge, a specification of the materials of manufacture of the containment system, the samples to be taken, and the tests to be made;
  - (f) Where the proposed radioactive contents are irradiated fuel, a statement and a justification of any assumption in the safety analysis relating to the characteristics of the fuel and a description of any pre-shipment measurement as required by 6.4.11.4 (b);
  - (g) Any special stowage provisions necessary to ensure the safe dissipation of heat from the package considering the various modes of carriage to be used and type of wagon or container;
  - (h) A reproducible illustration, not larger than 21 cm by 30 cm, showing the make-up of the package; and
  - (i) A specification of the applicable quality assurance programme as required in 1.7.3.
- 6.4.23.5** An application for approval of a Type B(M) package design shall include, in addition to the general information required for package approval in 6.4.23.4 for Type B(U) packages:
- (a) A list of the requirements specified in 6.4.7.5, 6.4.8.5, 6.4.8.6 and 6.4.8.9 to 6.4.8.15 with which the package does not conform;
  - (b) Any proposed supplementary operational controls to be applied during carriage not regularly provided for in RID, but which are necessary to ensure the safety of the package or to compensate for the deficiencies listed in (a) above;
  - (c) A statement relative to any restrictions on the mode of carriage and to any special loading, carriage, unloading or handling procedures; and

(d) The range of ambient conditions (temperature, solar radiation) which are expected to be encountered during carriage and which have been taken into account in the design.

**6.4.23.6** The application for approval of designs for packages containing 0.1 kg or more of uranium hexafluoride shall include all information necessary to satisfy the competent authority that the design meets the applicable requirements of 6.4.6.1, and a description of the applicable quality assurance programme as required in 1.7.3.

**6.4.23.7** An application for a fissile package approval shall include all information necessary to satisfy the competent authority that the design meets the applicable requirements of 6.4.11.1, and a specification of the applicable quality assurance programme as required by 1.7.3.

**6.4.23.8** An application for approval of design for special form radioactive material and design for low dispersible radioactive material shall include:

(a) A detailed description of the radioactive material or, if a capsule, the contents; particular reference shall be made to both physical and chemical states;

(b) A detailed statement of the design of any capsule to be used;

(c) A statement of the tests which have been done and their results, or evidence based on calculative methods to show that the radioactive material is capable of meeting the performance standards, or other evidence that the special form radioactive material or low dispersible radioactive material meets the applicable requirements of RID;

(d) A specification of the applicable quality assurance programme as required in 1.7.3; and

(e) Any proposed pre-shipment actions for use in the consignment of special form radioactive material or low dispersible radioactive material.

**6.4.23.9** Each approval certificate issued by a competent authority shall be assigned an identification mark. The identification mark shall be of the following generalized type:

VRI/Number/Type Code

(a) Except as provided in 6.4.23.10 (b), VRI represents the international vehicle registration identification code of the country issuing the certificate<sup>1</sup>;

(b) The number shall be assigned by the competent authority, and shall be unique and specific with regard to the particular design or shipment. The shipment approval identification mark shall be clearly related to the design approval identification mark;

(c) The following type codes shall be used in the order listed to indicate the types of approval certificates issued:

AF Type A package design for fissile material

B(U) Type B(U) package design [B(U) F if for fissile material]

B(M) Type B(M) package design [B(M) F if for fissile material]

C Type C package design (CF if for fissile material)

IF Industrial package design for fissile material

S Special form radioactive material

LD Low dispersible radioactive material

T Shipment

X Special arrangement

In the case of package designs for non-fissile or fissile excepted uranium hexafluoride, where none of the above codes apply, then the following type codes shall be used:

H(U) Unilateral approval

H(M) Multilateral approval;

(d) For package design and special form radioactive material approval certificates, other than those issued under the transitional provisions of 1.6.6.2 and 1.6.6.3, and for low dispersible radioactive material approval certificates, the symbols "-96" shall be added to the type code.

**6.4.23.10** These type codes shall be applied as follows:

(a) Each certificate and each package shall bear the appropriate identification mark, comprising the symbols prescribed in 6.4.23.9 (a), (b), (c) and (d) above, except that, for packages, only the applicable design type codes including, if applicable, the symbols "-96", shall appear following the second stroke, that is, the "T" or "X" shall not appear in the identification marking on the package. Where the design approval and shipment approval are combined, the applicable type codes do not need to be repeated.

---

<sup>1</sup> See Vienna Convention on Road Traffic (1968).

For example:

A/132/B(M)F-96: A Type B(M) package design approved for fissile material, requiring multilateral approval, for which the competent authority of Austria has assigned the design number 132 (to be marked on both the package and on the package design approval certificate);

A/132/B(M)F-96T: The shipment approval issued for a package bearing the identification mark elaborated above (to be marked on the certificate only);

A/137/X: A special arrangement approval issued by the competent authority of Austria, to which the number 137 has been assigned (to be marked on the certificate only);

A/139/IF-96: An industrial package design for fissile material approved by the competent authority of Austria, to which package design number 139 has been assigned (to be marked on both the package and on the package design approval certificate); and

A/145/H(U)-96: A package design for fissile excepted uranium hexafluoride approved by the competent authority of Austria, to which package design number 145 has been assigned (to be marked on both the package and on the package design approval certificate);

- (b) Where multilateral approval is effected by validation according to 6.4.23.16, only the identification mark issued by the country of origin of the design or shipment shall be used. Where multilateral approval is effected by issue of certificates by successive countries, each certificate shall bear the appropriate identification mark and the package whose design was so approved shall bear all appropriate identification marks.

For example:

A/132/B(M)F-96

CH/28/B(M)F-96

would be the identification mark of a package which was originally approved by Austria and was subsequently approved, by separate certificate, by Switzerland. Additional identification marks would be tabulated in a similar manner on the package;

- (c) The revision of a certificate shall be indicated by a parenthetical expression following the identification mark on the certificate. For example, A/132/B(M)F-96 (Rev.2) would indicate revision 2 of the Austrian package design approval certificate; or A/132/B(M)F-96 (Rev.0) would indicate the original issuance of the Austrian package design approval certificate. For original issuances, the parenthetical entry is optional and other words such as "original issuance" may also be used in place of "Rev.0". Certificate revision numbers may only be issued by the country issuing the original approval certificate;
- (d) Additional symbols (as may be necessitated by national regulations) may be added in brackets to the end of the identification mark; for example, A/132/B(M)F-96(SP503);
- (e) It is not necessary to alter the identification mark on the packaging each time that a revision to the design certificate is made. Such re-marking shall be required only in those cases where the revision to the package design certificate involves a change in the letter type codes for the package design following the second stroke.

**6.4.23.11** Each approval certificate issued by a competent authority for special form radioactive material or low dispersible radioactive material shall include the following information:

- (a) Type of certificate;
- (b) The competent authority identification mark;
- (c) The issue date and an expiry date;
- (d) List of applicable national and international regulations, including the edition of the IAEA Regulations for the Safe Transport of Radioactive Material under which the special form radioactive material or low dispersible radioactive material is approved;
- (e) The identification of the special form radioactive material or low dispersible radioactive material;
- (f) A description of the special form radioactive material or low dispersible radioactive material;
- (g) Design specifications for the special form radioactive material or low dispersible radioactive material which may include references to drawings;
- (h) A specification of the radioactive contents which includes the activities involved and which may include the physical and chemical form;
- (i) A specification of the applicable quality assurance programme as required in 1.7.3;
- (j) Reference to information provided by the applicant relating to specific actions to be taken prior to shipment;
- (k) If deemed appropriate by the competent authority, reference to the identity of the applicant;
- (l) Signature and identification of the certifying official.

**6.4.23.12** Each approval certificate issued by a competent authority for a special arrangement shall include the following information:

- (a) Type of certificate;
- (b) The competent authority identification mark;

- (c) The issue date and an expiry date;
- (d) Mode(s) of carriage;
- (e) Any restrictions on the modes of carriage, type of wagon, container, and any necessary routing instructions;
- (f) List of applicable national and international regulations, including the edition of the IAEA Regulations for the Safe Transport of Radioactive Material under which the special arrangement is approved;
- (g) The following statement:  
"This certificate does not relieve the consignor from compliance with any requirement of the government of any country through or into which the package will be carried.";
- (h) References to certificates for alternative radioactive contents, other competent authority validation, or additional technical data or information, as deemed appropriate by the competent authority;
- (i) Description of the packaging by a reference to the drawings or a specification of the design. If deemed appropriate by the competent authority, a reproducible illustration, not larger than 21 cm by 30 cm, showing the make-up of the package shall also be provided, accompanied by a brief description of the packaging, including materials of manufacture, gross mass, general outside dimensions and appearance;
- (j) A specification of the authorized radioactive contents, including any restrictions on the radioactive contents which might not be obvious from the nature of the packaging. This shall include the physical and chemical forms, the activities involved (including those of the various isotopes, if appropriate), amounts in grams (for fissile material), and whether special form radioactive material or low dispersible radioactive material, if applicable;
- (k) Additionally, for packages containing fissile material:
  - (i) a detailed description of the authorized radioactive contents;
  - (ii) the value of the criticality safety index;
  - (iii) reference to the documentation that demonstrates the criticality safety of the contents;
  - (iv) any special features, on the basis of which the absence of water from certain void spaces has been assumed in the criticality assessment;
  - (v) any allowance (based on 6.4.11.4 (b)) for a change in neutron multiplication assumed in the criticality assessment as a result of actual irradiation experience; and
  - (vi) the ambient temperature range for which the special arrangement has been approved;
- (l) A detailed listing of any supplementary operational controls required for preparation, loading, carriage, unloading and handling of the consignment, including any special stowage provisions for the safe dissipation of heat;
- (m) If deemed appropriate by the competent authority, reasons for the special arrangement;
- (n) Description of the compensatory measures to be applied as a result of the shipment being under special arrangement;
- (o) Reference to information provided by the applicant relating to the use of the packaging or specific actions to be taken prior to the shipment;
- (p) A statement regarding the ambient conditions assumed for purposes of design if these are not in accordance with those specified in 6.4.8.5, 6.4.8.6 and 6.4.8.15, as applicable;
- (q) Any emergency arrangements deemed necessary by the competent authority;
- (r) A specification of the applicable quality assurance programme as required in 1.7.3;
- (s) If deemed appropriate by the competent authority, reference to the identity of the applicant and to the identity of the carrier;
- (t) Signature and identification of the certifying official.

**6.4.23.13** Each approval certificate for a shipment issued by a competent authority shall include the following information:

- (a) Type of certificate;
- (b) The competent authority identification mark(s);
- (c) The issue date and an expiry date;
- (d) List of applicable national and international regulations, including the edition of the IAEA Regulations for the Safe Transport of Radioactive Material under which the shipment is approved;
- (e) Any restrictions on the modes of carriage, type of wagon, container, and any necessary routing instructions;
- (f) The following statement:  
"This certificate does not relieve the consignor from compliance with any requirement of the government of any country through or into which the package will be carried.";
- (g) A detailed listing of any supplementary operational controls required for preparation, loading, carriage, unloading and handling of the consignment, including any special stowage provisions for the safe dissipation of heat or maintenance of criticality safety;

- (h) Reference to information provided by the applicant relating to specific actions to be taken prior to shipment;
- (i) Reference to the applicable design approval certificate(s);
- (j) A specification of the actual radioactive contents, including any restrictions on the radioactive contents which might not be obvious from the nature of the packaging. This shall include the physical and chemical forms, the total activities involved (including those of the various isotopes, if appropriate), amounts in grams (for fissile material), and whether special form radioactive material or low dispersible radioactive material, if applicable;
- (k) Any emergency arrangements deemed necessary by the competent authority;
- (l) A specification of the applicable quality assurance programme as required in 1.7.3;
- (m) If deemed appropriate by the competent authority, reference to the identity of the applicant;
- (n) Signature and identification of the certifying official.

**6.4.23.14** Each approval certificate of the design of a package issued by a competent authority shall include the following information:

- (a) Type of certificate;
- (b) The competent authority identification mark;
- (c) The issue date and an expiry date;
- (d) Any restriction on the modes of carriage, if appropriate;
- (e) List of applicable national and international regulations, including the edition of the IAEA Regulations for the Safe Transport of Radioactive Material under which the design is approved;
- (f) The following statement:  
"This certificate does not relieve the consignor from compliance with any requirement of the government of any country through or into which the package will be carried.";
- (g) References to certificates for alternative radioactive contents, other competent authority validation, or additional technical data or information, as deemed appropriate by the competent authority;
- (h) A statement authorizing shipment where shipment approval is required under 5.1.5.1.2, if deemed appropriate;
- (i) Identification of the packaging;
- (j) Description of the packaging by a reference to the drawings or specification of the design. If deemed appropriate by the competent authority, a reproducible illustration, not larger than 21 cm by 30 cm, showing the make-up of the package should also be provided, accompanied by a brief description of the packaging, including materials of manufacture, gross mass, general outside dimensions and appearance;
- (k) Specification of the design by reference to the drawings;
- (l) A specification of the authorized radioactive content, including any restrictions on the radioactive contents which might not be obvious from the nature of the packaging. This shall include the physical and chemical forms, the activities involved (including those of the various isotopes, if appropriate), amounts in grams (for fissile material), and whether special form radioactive material or low dispersible radioactive material, if applicable;
- (m) A description of the containment system;
- (n) Additionally, for packages containing fissile material:
  - (i) a detailed description of the authorized radioactive contents;
  - (ii) a description of the confinement system;
  - (iii) the value of the criticality safety index;
  - (iv) reference to the documentation that demonstrates the criticality safety of the contents;
  - (v) any special features, on the basis of which the absence of water from certain void spaces has been assumed in the criticality assessment;
  - (vi) any allowance (based on 6.4.11.4 (b)) for a change in neutron multiplication assumed in the criticality assessment as a result of actual irradiation experience; and
  - (vii) the ambient temperature range for which the package design has been approved;
- (o) For Type B(M) packages, a statement specifying those requirements of 6.4.7.5, 6.4.8.4, 6.4.8.5, 6.4.8.6 and 6.4.8.9 to 6.4.8.15 with which the package does not conform and any amplifying information which may be useful to other competent authorities;
- (p) For packages containing more than 0.1 kg of uranium hexafluoride, a statement specifying those provisions of 6.4.6.4 which apply if any and any amplifying information which may be useful to other competent authorities;
- (q) A detailed listing of any supplementary operational controls required for preparation, loading, carriage, unloading and handling of the consignment, including any special stowage provisions for the safe dissipation of heat;

- (r) Reference to information provided by the applicant relating to the use of the packaging or specific actions to be taken prior to shipment;
- (s) A statement regarding the ambient conditions assumed for purposes of design if these are not in accordance with those specified in 6.4.8.5, 6.4.8.6 and 6.4.8.15, as applicable;
- (t) A specification of the applicable quality assurance programme as required in 1.7.3;
- (u) Any emergency arrangements deemed necessary by the competent authority;
- (v) If deemed appropriate by the competent authority, reference to the identity of the applicant;
- (w) Signature and identification of the certifying official.

**6.4.23.15** The competent authority shall be informed of the serial number of each packaging manufactured to a design approved by them under 1.6.6.2.1, 1.6.6.2.2, 6.4.22.2, 6.4.22.3 and 6.4.22.4.

**6.4.23.16** Multilateral approval may be by validation of the original certificate issued by the competent authority of the country of origin of the design or shipment. Such validation may take the form of an endorsement on the original certificate or the issuance of a separate endorsement, annex, supplement, etc., by the competent authority of the country through or into which the shipment is made.

## Chapter 6.5

### Requirements for the construction and testing of intermediate bulk containers (IBCs)

#### 6.5.1 General requirements

##### 6.5.1.1 Scope

**6.5.1.1.1** The requirements of this Chapter apply to intermediate bulk containers (IBCs) the use of which is expressly authorized for the carriage of certain dangerous goods according to the packing instructions indicated in Column (8) of Table A in Chapter 3.2. Portable tanks and tank-containers which meet the requirements of Chapter 6.7 or 6.8 respectively are not considered to be IBCs. IBCs which meet the requirements of this Chapter are not considered to be containers for the purposes of RID. The letters IBC only will be used in the rest of the text to refer to intermediate bulk containers.

**6.5.1.1.2** Exceptionally, IBCs and their service equipment not conforming strictly to the requirements herein, but having acceptable alternatives, may be considered by the competent authority for approval. In addition, in order to take into account progress in science and technology, the use of alternative arrangements which offer at least equivalent safety in use in respect of compatibility with the properties of the substances carried and equivalent or superior resistance to impact, loading and fire, may be considered by the competent authority.

**6.5.1.1.3** The construction, equipment, testing, marking and operation of IBCs shall be subject to acceptance by the competent authority of the country in which the IBCs are approved.

**6.5.1.1.4** Manufacturers and subsequent distributors of IBCs shall provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that IBCs as presented for carriage are capable of passing the applicable performance tests of this Chapter.

**6.5.1.2** (Reserved)

**6.5.1.3** (Reserved)

#### 6.5.1.4 Designatory code system for IBCs

**6.5.1.4.1** The code shall consist of two Arabic numerals as specified in (a), followed by a capital letter(s) specified in (b), followed, when specified in an individual section, by an Arabic numeral indicating the category of IBC.

(a)

Type	For solids, filled or discharged		For liquids
	by gravity	under pressure of more than 10 kPa (0.1 bar)	
Rigid	11	21	31
Flexible	13	–	–

(b) Materials

- A. Steel (all types and surface treatments)
- B. Aluminium
- C. Natural wood
- D. Plywood
- F. Reconstituted wood
- G. Fibreboard
- H. Plastics material
- L. Textile
- M. Paper, multiwall
- N. Metal (other than steel or aluminium).

**6.5.1.4.2** For composite IBCs, two capital letters in Latin characters shall be used in sequence in the second position of the code. The first shall indicate the material of the inner receptacle of the IBC and the second that of the outer packaging of the IBC.

**6.5.1.4.3** The following types and codes of IBC are assigned:

Material	Category	Code	Sub-section
Metal			
A. Steel	for solids, filled or discharged by gravity for solids, filled or discharged under pressure for liquids	11A 21A 31A	6.5.5.1
B. Aluminium	for solids, filled or discharged by gravity for solids, filled or discharged under pressure for liquids	11B 21B 31B	
N. Other than steel or aluminium	for solids, filled or discharged by gravity for solids, filled or discharged under pressure for liquids	11N 21N 31N	
Flexible			
H. Plastics	woven plastics without coating or liner woven plastics, coated woven plastics with liner woven plastics, coated and with liner plastics film	13H1 13H2 13H3 13H4 13H5	6.5.5.2
L. Textile	without coating or liner coated with liner coated and with liner	13L1 13L2 13L3 13L4	
M. Paper	multiwall multiwall, water resistant	13M1 13M2	
H. Rigid plastics	for solids, filled or discharged by gravity, fitted with structural equipment for solids, filled or discharged by gravity, freestanding for solids, filled or discharged under pressure, fitted with structural equipment for solids, filled or discharged under pressure, freestanding for liquids, fitted with structural equipment for liquids, freestanding	11H1 11H2 21H1 21H2 31H1 31H2	6.5.5.3
HZ. Composite with plastics inner receptacle <sup>a</sup>	for solids, filled or discharged by gravity, with rigid plastics inner receptacle for solids, filled or discharged by gravity, with flexible plastics inner receptacle for solids, filled or discharged under pressure, with rigid plastics inner receptacle for solids, filled or discharged under pressure, with flexible plastics inner receptacle for liquids, with rigid plastics inner receptacle for liquids, with flexible plastics inner receptacle	11HZ1 11HZ2 21HZ1 21HZ2 31HZ1 31HZ2	6.5.5.4
G. Fibreboard	for solids, filled or discharged by gravity	11G	6.5.5.5
Wooden			
C. Natural wood	for solids, filled or discharged by gravity with inner liner	11C	6.5.5.6
D. Plywood	for solids, filled or discharged by gravity, with inner liner	11D	
F. Reconstituted wood	for solids, filled or discharged by gravity, with inner liner	11F	

<sup>a</sup> The code shall be completed by replacing the letter Z by a capital letter in accordance with 6.5.1.4.1 (b) to indicate the nature of the material used for the outer casing.

- 6.5.1.4.4** The letter "W" may follow the IBC code. The letter "W" signifies that the IBC, although of the same type indicated by the code, is manufactured to a specification different from those in 6.5.5 and is considered equivalent in accordance with the requirements in 6.5.1.1.2.

## **6.5.2 Marking**

### **6.5.2.1 Primary marking**

- 6.5.2.1.1** Each IBC manufactured and intended for use according to RID shall bear markings which are durable, legible and placed in a location so as to be readily visible. Letters, numerals and symbols shall be at least 12 mm high and shall show:

- (a) The United Nations packaging symbol: . This symbol shall not be used for any purpose other than certifying that a packaging complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5 or 6.6. For metal IBCs on which the marking is stamped or embossed, the capital letters "UN" may be applied instead of the symbol;
- (b) The code designating the type of IBC according to 6.5.1.4;
- (c) A capital letter designating the packing group(s) for which the design type has been approved:
  - (i) X for packing groups I, II and III (IBCs for solids only);
  - (ii) Y for packing groups II and III;
  - (iii) Z for packing group III only;
- (d) The month and year (last two digits) of manufacture;
- (e) The State authorizing the allocation of the mark; indicated by the distinguishing sign for motor vehicles in international traffic<sup>1</sup>;
- (f) The name or symbol of the manufacturer and other identification of the IBC as specified by the competent authority;
- (g) The stacking test load in kg. For IBCs not designed for stacking, the figure "0" shall be shown;
- (h) The maximum permissible gross mass in kg.

The primary marking required above shall be applied in the sequence of the subparagraphs below. The marking required by 6.5.2.2 and any further marking authorized by a competent authority shall still enable the parts of the mark to be correctly identified.

Each element of the marking applied in accordance with (a) to (h) and with 6.5.2.2 shall be clearly separated, e.g. by a slash or space, so as to be easily identifiable.

- 6.5.2.1.2** Examples of markings for various types of IBC in accordance with 6.5.2.1.1 (a) to (h) above:

	11A/Y/0299 NL/Mulder 007/5500/1500	For a metal IBC for solids discharged by gravity and made from steel / for packing groups II and III / manufactured in February 1999 / authorized by the Netherlands / manufactured by Mulder and of a design type to which the competent authority has allocated serial number 007 / the stacking test load in kg / the maximum permissible gross mass in kg.
	13H3/Z/0301 F/Meunier 1713/0/1500	For a flexible IBC for solids discharged for instance by gravity and made from woven plastics with a liner/not designed to be stacked.
	31H1/Y/0499 GB/9099/10800/1200	For a rigid plastics IBC for liquids made from plastics with structural equipment withstanding the stack load.
	31HA1/Y/0501 D/Müller/1683/10800/1200	For a composite IBC for liquids with a rigid plastics inner receptacle and a steel outer casing.
	11C/X/0102 S/Aurigny/9876/3000/910	For a wooden IBC for solids with an inner liner authorized for packing groups I, II and III solids.

<sup>1</sup> Distinguishing sign for motor vehicles in international traffic prescribed in Vienna Convention on Road Traffic (1968).

**6.5.2.2 Additional marking**

**6.5.2.2.1** Each IBC shall bear the markings required in 6.5.2.1 and, in addition, the following information which may appear on a corrosion-resistant plate permanently attached in a place readily accessible for inspection:

Additional marking	Category of IBC				
	Metal	Rigid plastics	Composite	Fibreboard	Wooden
Capacity in litres at 20 °C <sup>(a)</sup>	x	x	x		
Tare mass in kg <sup>(a)</sup>	x	x	x	x	x
Test (gauge) pressure, in kPa or bar <sup>(a)</sup> , if applicable		x	x		
Maximum filling / discharge pressure in kPa or bar <sup>(a)</sup> , if applicable	x	x	x		
Body material and its minimum thickness in mm	x				
Date of last leakproofness test, if applicable (month and year)	x	x	x		
Date of last inspection (month and year)	x	x	x		
Serial number of the manufacturer	x				
Maximum permitted stacking load <sup>(b)</sup>	x	x	x	x	x

<sup>(a)</sup> The unit used shall be indicated.

<sup>(b)</sup> See 6.5.2.2.2. This additional marking shall apply to all IBCs manufactured, repaired or remanufactured as from 1 January 2011 (see also 1.6.1.15).

**6.5.2.2.2** The maximum permitted stacking load applicable when the IBC is in use shall be displayed on a symbol as follows:

IBCs capable of being stacked

IBCs NOT capable of being stacked

The symbol shall be not less than 100 mm × 100 mm, be durable and clearly visible. The letters and numbers indicating the mass shall be at least 12 mm high.

The mass marked above the symbol shall not exceed the load imposed during the design type test (see 6.5.6.6.4) divided by 1.8.

**NOTE:** The provisions of 6.5.2.2.2 shall apply to all IBCs manufactured, repaired or remanufactured as from 1 January 2011 (see also 1.6.1.15).

**6.5.2.2.3** In addition to the markings required in 6.5.2.1, flexible IBCs may bear a pictogram indicating recommended lifting methods.

**6.5.2.2.4** The inner receptacle of composite IBCs shall be marked with at least the following information:

- (a) The name or symbol of the manufacturer and other identification of the IBC as specified by the competent authority as in 6.5.2.1.1 (f);
- (b) The date of manufacture, as in 6.5.2.1.1 (d);

(c) The distinguishing sign of the State authorizing the allocation of the mark, as in 6.5.2.1.1 (e).

**6.5.2.2.5** Where a composite IBCs is designed in such a manner that the outer casing is intended to be dismantled for carriage when empty (such as for return of the IBC for reuse to the original consignor), each of the parts intended to be detached when so dismantled shall be marked with the month and year of manufacture and the name or symbol of the manufacturer and other identification of the IBC as specified by the competent authority (see 6.5.2.1.1 (f)).

### **6.5.2.3 Conformity to design type**

The marking indicates that IBCs correspond to a successfully tested design type and that the requirements referred to in the certificate have been met.

## **6.5.3 Construction requirements**

### **6.5.3.1 General requirements**

**6.5.3.1.1** IBCs shall be resistant to or adequately protected from deterioration due to the external environment.

**6.5.3.1.2** IBCs shall be so constructed and closed that none of the contents can escape under normal conditions of carriage including the effect of vibration, or by changes in temperature, humidity or pressure.

**6.5.3.1.3** IBCs and their closures shall be constructed of materials compatible with their contents, or be protected internally, so that they are not liable:

- (a) To be attacked by the contents so as to make their use dangerous;
- (b) To cause the contents to react or decompose, or form harmful or dangerous compounds with the IBCs.

**6.5.3.1.4** Gaskets, where used, shall be made of materials not subject to attack by the contents of the IBCs.

**6.5.3.1.5** All service equipment shall be so positioned or protected as to minimize the risk of escape of the contents owing to damage during handling and carriage.

**6.5.3.1.6** IBCs, their attachments and their service and structural equipment shall be designed to withstand, without loss of contents, the internal pressure of the contents and the stresses of normal handling and carriage. IBCs intended for stacking shall be designed for stacking. Any lifting or securing features of IBCs shall be of sufficient strength to withstand the normal conditions of handling and carriage without gross distortion or failure and shall be so positioned that no undue stress is caused in any part of the IBC.

**6.5.3.1.7** Where an IBC consists of a body within a framework it shall be so constructed that:

- (a) The body does not chafe or rub against the framework so as to cause material damage to the body;
- (b) The body is retained within the framework at all times;
- (c) The items of equipment are fixed in such a way that they cannot be damaged if the connections between body and frame allow relative expansion or movement.

**6.5.3.1.8** Where a bottom discharge valve is fitted, it shall be capable of being made secure in the closed position and the whole discharge system shall be suitably protected from damage. Valves having lever closures shall be able to be secured against accidental opening and the open or closed position shall be readily apparent. For IBCs containing liquids, a secondary means of sealing the discharge aperture shall also be provided, e.g. a blank flange or equivalent device.

### **6.5.4 Testing, certification and inspection**

**6.5.4.1** *Quality assurance:* the IBCs shall be manufactured and tested under a quality assurance programme which satisfies the competent authority, in order to ensure that each manufactured IBC meets the requirements of this Chapter.

**NOTE:** ISO 16106:2006 "Packaging – Transport packages for dangerous goods – Dangerous goods packagings, intermediate bulk containers (IBCs) and large packagings – Guidelines for the application of ISO 9001" provides acceptable guidance on procedures which may be followed.

**6.5.4.2** *Test requirements:* IBCs shall be subject to design type tests and, if applicable, to initial and periodic inspections and tests in accordance with 6.5.4.4.

**6.5.4.3** *Certification:* in respect of each design type of IBC a certificate and mark (as in 6.5.2) shall be issued attesting that the design type, including its equipment, meets the test requirements.

### **6.5.4.4 Inspection and testing**

**NOTE:** See also 6.5.4.5 for tests and inspections on repaired IBCs.

**6.5.4.4.1** Every metal, rigid plastics and composite IBC shall be inspected to the satisfaction of the competent authority

(a) before it is put into service (including after remanufactured), and thereafter at intervals not exceeding five years, with regard to:

- (i) conformity to design type including marking;
- (ii) internal and external condition;
- (iii) proper functioning of service equipment.

Thermal insulation, if any, need be removed only to the extent necessary for a proper examination of the body of the IBC.

(b) at intervals of not more than two and a half years, with regard to:

- (i) external condition;
- (ii) proper functioning of service equipment.

Thermal insulation, if any, need be removed only to the extent necessary for a proper examination of the body of the IBC.

Each IBC shall correspond in all respects to its design type.

**6.5.4.4.2** Every metal, rigid plastics and composite IBC for liquids, or for solids which are filled or discharged under pressure, shall undergo a suitable leakproofness test **at least equally effective as the test prescribed in 6.5.6.7.3** and be capable of meeting the test level indicated in 6.5.6.7.3:

- (a) before it is first used for carriage;
- (b) at intervals of not more than two and a half years.

For this test the IBC **shall be fitted with the primary bottom closure**. The inner receptacle of a composite IBC may be tested without the outer casing, provided that the test results are not affected.

**6.5.4.4.3** A report of each inspection and test shall be kept by the owner of the IBC at least until the next inspection or test. The report shall include the results of the inspection and test and shall identify the party performing the inspection and test (see also the marking requirements in 6.5.2.2.1).

**6.5.4.4.4** The competent authority may at any time require proof, by tests in accordance with this Chapter, that IBCs meet the requirements of the design type tests.

#### **6.5.4.5 Repaired IBCs**

**6.5.4.5.1** When an IBC is impaired as a result of impact (e.g. accident) or any other cause, it shall be repaired or otherwise maintained (see definition of "Routine maintenance of IBCs" in 1.2.1), so as to conform to the design type. The bodies of rigid plastics IBCs and the inner receptacles of composite IBCs that are impaired shall be replaced.

**6.5.4.5.2** In addition to any other testing and inspection requirements in RID, an IBC shall be subjected to the full testing and inspection requirements set out in 6.5.4.4, and the required reports shall be prepared, whenever it is repaired.

**6.5.4.5.3** The party performing the tests and inspections after the repair shall durably mark the IBC near the manufacturer's UN design type marking to show:

- (a) the State in which the tests and inspections were carried out;
- (b) the name or authorized symbol of the party performing the tests and inspections; and
- (c) the date (month, year) of the tests and inspections.

**6.5.4.5.4** Test and inspections performed in accordance with 6.5.4.5.2 may be considered to satisfy the requirements for the two and a half and five year periodic tests and inspections.

#### **6.5.5 Specific requirements for IBCs**

##### **6.5.5.1 Specific requirements for metal IBCs**

**6.5.5.1.1** These requirements apply to metal IBCs intended for the carriage of solids and liquids. There are three categories of metal IBCs:

- (a) those for solids which are filled or discharged by gravity (11A, 11B, 11N);
- (b) those for solids which are filled or discharged at a gauge pressure greater than 10 kPa (0.1 bar) (21A, 21B, 21N); and
- (c) those for liquids (31A, 31B, 31N).

**6.5.5.1.2** Bodies shall be made of suitable ductile metal in which the weldability has been fully demonstrated. Welds shall be skilfully made and afford complete safety. Low-temperature performance of the material shall be taken into account when appropriate.

**6.5.5.1.3** Care shall be taken to avoid damage by galvanic action due to the juxtaposition of dissimilar metals.

**6.5.5.1.4** Aluminium IBCs intended for the carriage of flammable liquids shall have no movable parts, such as covers, closures, etc., made of unprotected steel liable to rust, which might cause a dangerous reaction by coming into frictional or percussive contact with the aluminium.

**6.5.5.1.5** Metal IBCs shall be made of metals which meet the following requirements:

(a) for steel the elongation at fracture, in %, shall not be less than  $\frac{10000}{R_m}$  with an absolute minimum of 20%;

where  $R_m$  = guaranteed minimum tensile strength of the steel to be used, in  $N/mm^2$ ;

(b) for aluminium and its alloy the elongation at fracture, in %, shall not be less than  $\frac{10000}{6 R_m}$  with an absolute minimum of 8%.

Specimens used to determine the elongation at fracture shall be taken transversely to the direction of rolling and be so secured that:

$$L_0 = 5d \quad \text{or} \quad L_0 = 5,65 \sqrt{A}$$

where:  $L_0$  = gauge length of the specimen before the test

$d$  = diameter

$A$  = cross-sectional area of test specimen.

**6.5.5.1.6** Minimum wall thickness:

(a) for a reference steel having a product of  $R_m \times A_0 = 10\,000$ , the wall thickness shall not be less than:

Capacity (C) in litres	Wall thickness (T) in mm			
	Types 11A, 11B, 11N		Types 21A, 21B, 21N, 31A, 31B, 31N	
	Unprotected	Protected	Unprotected	Protected
$C \leq 1000$	2.0	1.5	2.5	2.0
$1000 < C \leq 2000$	$T = C/2000 + 1.5$	$T = C/2000 + 1.0$	$T = C/2000 + 2.0$	$T = C/2000 + 1.5$
$2000 < C \leq 3000$	$T = C/2000 + 1.5$	$T = C/2000 + 1.0$	$T = C/1000 + 1.0$	$T = C/2000 + 1.5$

where:  $A_0$  = minimum elongation (as a percentage) of the reference steel to be used on fracture under tensile stress (see 6.5.5.1.5);

(b) for metals other than the reference steel described in (a), the minimum wall thickness is given by the following equivalence formula:

$$e_1 = \frac{21.4 \times e_0}{\sqrt[3]{R_{m1} \times A_1}}$$

where:  $e_1$  = required equivalent wall thickness of the metal to be used (in mm);

$e_0$  = required minimum wall thickness for the reference steel (in mm);

$R_{m1}$  = guaranteed minimum tensile strength of the metal to be used (in  $N/mm^2$ ) (see (c));

$A_1$  = minimum elongation (as a percentage) of the metal to be used on fracture under tensile stress (see 6.5.5.1.5).

However, in no case shall the wall thickness be less than 1.5 mm.

(c) For purposes of the calculation described in (b), the guaranteed minimum tensile strength of the metal to be used ( $R_{m1}$ ) shall be the minimum value according to national or international material standards. However, for austenitic steels, the specified value for  $R_m$  according to the material standards may be increased by up to 15% when a greater value is attested in the material inspection certificate. When no material standard exists for the material in question, the value of  $R_m$  shall be the minimum value attested in the material inspection certificate.

**6.5.5.1.7** Pressure-relief requirements: IBCs for liquids shall be capable of releasing a sufficient amount of vapour in the event of fire engulfment to ensure that no rupture of the body will occur. This can be achieved by conventional pressure relief devices or by other constructional means. The start-to-discharge pressure shall not be higher than 65 kPa (0.65 bar) and no lower than the total gauge pressure experienced in the IBC (i.e. the vapour pressure of the filling substance plus the partial pressure of the air or other inert gases, minus 100 kPa (1 bar)) at 55 °C, determined on the basis of a maximum degree of filling as defined in 4.1.1.4. The required relief devices shall be fitted in the vapour space.

**6.5.5.2** **Specific requirements for flexible IBCs**

**6.5.5.2.1** These requirements apply to flexible IBCs of the following types:

13H1 woven plastics without coating or liner

- 13H2 woven plastics, coated
- 13H3 woven plastics with liner
- 13H4 woven plastics, coated and with liner
- 13H5 plastics film
- 13L1 textile without coating or liner
- 13L2 textile, coated
- 13L3 textile with liner
- 13L4 textile, coated and with liner
- 13M1 paper, multiwall
- 13M2 paper, multiwall, water resistant

Flexible IBCs are intended for the carriage of solids only.

- 6.5.5.2.2** Bodies shall be manufactured from suitable materials. The strength of the material and the construction of the flexible IBC shall be appropriate to its capacity and its intended use.
- 6.5.5.2.3** All materials used in the construction of flexible IBCs of types 13M1 and 13M2 shall, after complete immersion in water for not less than 24 hours, retain at least 85% of the tensile strength as measured originally on the material conditioned to equilibrium at 67% relative humidity or less.
- 6.5.5.2.4** Seams shall be formed by stitching, heat sealing, gluing or any equivalent method. All stitched seam-ends shall be secured.
- 6.5.5.2.5** Flexible IBCs shall provide adequate resistance to ageing and to degradation caused by ultraviolet radiation or the climatic conditions, or by the substance contained, thereby rendering them appropriate to their intended use.
- 6.5.5.2.6** For flexible plastics IBCs where protection against ultraviolet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the body. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.
- 6.5.5.2.7** Additives may be incorporated into the material of the body to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.
- 6.5.5.2.8** No material recovered from used receptacles shall be used in the manufacture of IBC bodies. Production residues or scrap from the same manufacturing process may, however, be used. Component parts such as fittings and pallet bases may also be used provided such components have not in any way been damaged in previous use.
- 6.5.5.2.9** When filled, the ratio of height to width shall be not more than 2:1.
- 6.5.5.2.10** The liner shall be made of a suitable material. The strength of the material used and the construction of the liner shall be appropriate to the capacity of the IBC and the intended use. Joins and closures shall be siftproof and capable of withstanding pressures and impacts liable to occur under normal conditions of handling and carriage.
- 6.5.5.3 Specific requirements for rigid plastics IBCs**
- 6.5.5.3.1** These requirements apply to rigid plastics IBCs for the carriage of solids or liquids. Rigid plastics IBCs are of the following types:
  - 11H1 fitted with structural equipment designed to withstand the whole load when IBCs are stacked, for solids which are filled or discharged by gravity
  - 11H2 freestanding, for solids which are filled or discharged by gravity
  - 21H1 fitted with structural equipment designed to withstand the whole load when IBCs are stacked, for solids which are filled or discharged under pressure
  - 21H2 freestanding, for solids which are filled or discharged under pressure
  - 31H1 fitted with structural equipment designed to withstand the whole load when IBCs are stacked, for liquids
  - 31H2 freestanding, for liquids.
- 6.5.5.3.2** The body shall be manufactured from suitable plastics material of known specifications and be of adequate strength in relation to its capacity and its intended use. The material shall be adequately resistant to ageing and to degradation caused by the substance contained or, where relevant, by ultraviolet radiation. Low

temperature performance shall be taken into account when appropriate. Any permeation of the substance contained shall not constitute a danger under normal conditions of carriage.

**6.5.5.3.3** Where protection against ultraviolet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the body. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.

**6.5.5.3.4** Additives may be incorporated in the material of the body to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.

**6.5.5.3.5** No used material other than production residues or regrind from the same manufacturing process may be used in the manufacture of rigid plastics IBCs.

**6.5.5.4 Specific requirements for composite IBCs with plastics inner receptacles**

**6.5.5.4.1** These requirements apply to composite IBCs for the carriage of solids and liquids of the following types:

11HZ1 Composite IBCs with a rigid plastics inner receptacle, for solids filled or discharged by gravity

11HZ2 Composite IBCs with a flexible plastics inner receptacle, for solids filled or discharged by gravity

21HZ1 Composite IBCs with a rigid plastics inner receptacle, for solids filled or discharged under pressure

21HZ2 Composite IBCs with a flexible plastics inner receptacle, for solids filled or discharged under pressure

31HZ1 Composite IBCs with a rigid plastics inner receptacle, for liquids

31HZ2 Composite IBCs with a flexible plastics inner receptacle, for liquids.

This code shall be completed by replacing the letter Z by a capital letter in accordance with 6.5.1.4.1 (b) to indicate the nature of the material used for the outer casing.

**6.5.5.4.2** The inner receptacle is not intended to perform a containment function without its outer casing. A "rigid" inner receptacle is a receptacle which retains its general shape when empty without closures in place and without benefit of the outer casing. Any inner receptacle that is not "rigid" is considered to be "flexible".

**6.5.5.4.3** The outer casing normally consists of rigid material formed so as to protect the inner receptacle from physical damage during handling and carriage but is not intended to perform the containment function. It includes the base pallet where appropriate.

**6.5.5.4.4** A composite IBC with a fully enclosing outer casing shall be so designed that the integrity of the inner receptacle may be readily assessed following the leakproofness and hydraulic pressure tests.

**6.5.5.4.5** IBCs of type 31HZ2 shall be limited to a capacity of not more than 1 250 litres.

**6.5.5.4.6** The inner receptacle shall be manufactured from suitable plastics material of known specifications and be of adequate strength in relation to its capacity and its intended use. The material shall be adequately resistant to ageing and to degradation caused by the substance contained or, where relevant, by ultraviolet radiation. Low temperature performance shall be taken into account when appropriate. Any permeation of the substance contained shall not constitute a danger under normal conditions of carriage.

**6.5.5.4.7** Where protection against ultraviolet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the inner receptacle. Where use is made of carbon black, pigments or inhibitors, other than those used in the manufacture of the tested design type, retesting may be waived if changes in carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.

**6.5.5.4.8** Additives may be incorporated in the material of the inner receptacle to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.

**6.5.5.4.9** No used material other than production residues or regrind from the same manufacturing process may be used in the manufacture of inner receptacles.

**6.5.5.4.10** The inner receptacle of IBCs type 31HZ2 shall consist of at least three plies of film.

**6.5.5.4.11** The strength of the material and the construction of the outer casing shall be appropriate to the capacity of the composite IBC and its intended use.

**6.5.5.4.12** The outer casing shall be free of any projection that might damage the inner receptacle.

- 6.5.5.4.13** Metal outer casings shall be constructed of a suitable metal of adequate thickness.
- 6.5.5.4.14** Outer casings of natural wood shall be of well seasoned wood, commercially dry and free from defects that would materially lessen the strength of any part of the casing. The tops and bottoms may be made of water resistant reconstituted wood such as hardboard, particle board or other suitable type.
- 6.5.5.4.15** Outer casings of plywood shall be made of well seasoned rotary cut, sliced or sawn veneer, commercially dry and free from defects that would materially lessen the strength of the casing. All adjacent plies shall be glued with water resistant adhesive. Other suitable materials may be used with plywood for the construction of casings. Casings shall be firmly nailed or secured to corner posts or ends or be assembled by equally suitable devices.
- 6.5.5.4.16** The walls of outer casings of reconstituted wood shall be made of water resistant reconstituted wood such as hardboard, particle board or other suitable type. Other parts of the casings may be made of other suitable material.
- 6.5.5.4.17** For fibreboard outer casings, strong and good quality solid or double-faced corrugated fibreboard (single or multiwall) shall be used appropriate to the capacity of the casing and to its intended use. The water resistance of the outer surface shall be such that the increase in mass, as determined in a test carried out over 30 minutes by the Cobb method of determining water absorption, is not greater than 155 g/m<sup>2</sup> (see ISO 535:1991). It shall have proper bending qualities. Fibreboard shall be cut, creased without scoring, and slotted so as to permit assembly without cracking, surface breaks or undue bending. The fluting of corrugated fibreboard shall be firmly glued to the facings.
- 6.5.5.4.18** The ends of fibreboard outer casings may have a wooden frame or be entirely of wood. Reinforcements of wooden battens may be used.
- 6.5.5.4.19** Manufacturing joints in the fibreboard outer casing shall be taped, lapped and glued, or lapped and stitched with metal staples. Lapped joints shall have an appropriate overlap. Where closing is effected by gluing or taping, a water resistant adhesive shall be used.
- 6.5.5.4.20** Where the outer casing is of plastics material, the relevant requirements of 6.5.5.4.6 to 6.5.5.4.9 apply, on the understanding that, in this case, the requirements applicable to the inner receptacle are applicable to the outer casing of composite IBCs.
- 6.5.5.4.21** The outer casing of an IBC type 31HZ2 shall enclose the inner receptacle on all sides.
- 6.5.5.4.22** Any integral pallet base forming part of an IBC or any detachable pallet shall be suitable for mechanical handling with the IBC filled to its maximum permissible gross mass.
- 6.5.5.4.23** The pallet or integral base shall be designed so as to avoid any protrusion of the base of the IBC that might be liable to damage in handling.
- 6.5.5.4.24** The outer casing shall be secured to any detachable pallet to ensure stability in handling and carriage. Where a detachable pallet is used, its top surface shall be free from sharp protrusions that might damage the IBC.
- 6.5.5.4.25** Strengthening devices such as timber supports to increase stacking performance may be used but shall be external to the inner receptacle.
- 6.5.5.4.26** Where IBCs are intended for stacking, the bearing surface shall be such as to distribute the load in a safe manner. Such IBCs shall be designed so that the load is not supported by the inner receptacle.
- 6.5.5.5 Specific requirements for fibreboard IBCs**
- 6.5.5.5.1** These requirements apply to fibreboard IBCs for the carriage of solids which are filled or discharged by gravity. Fibreboard IBCs are of the following type: 11G.
- 6.5.5.5.2** Fibreboard IBCs shall not incorporate top lifting devices.
- 6.5.5.5.3** The body shall be made of strong and good quality solid or double-faced corrugated fibreboard (single or multiwall), appropriate to the capacity of the IBC and to its intended use. The water resistance of the outer surface shall be such that the increase in mass, as determined in a test carried out over a period of 30 minutes by the Cobb method of determining water absorption, is not greater than 155 g/m<sup>2</sup> (see ISO 535:1991). It shall have proper bending qualities. Fibreboard shall be cut, creased without scoring, and slotted so as to permit assembly without cracking, surface breaks or undue bending. The fluting or corrugated fibreboard shall be firmly glued to the facings.
- 6.5.5.5.4** The walls, including top and bottom, shall have a minimum puncture resistance of 15 J measured according to ISO 3036:1975.

- 6.5.5.5.5** Manufacturing joins in the body of IBCs shall be made with an appropriate overlap and shall be taped, glued, stitched with metal staples or fastened by other means at least equally effective. Where joins are effected by gluing or taping, a water resistant adhesive shall be used. Metal staples shall pass completely through all pieces to be fastened and be formed or protected so that any inner liner cannot be abraded or punctured by them.
- 6.5.5.5.6** The liner shall be made of a suitable material. The strength of the material used and the construction of the liner shall be appropriate to the capacity of the IBC and the intended use. Joins and closures shall be siftproof and capable of withstanding pressures and impacts liable to occur under normal conditions of handling and carriage.
- 6.5.5.5.7** Any integral pallet base forming part of an IBC or any detachable pallet shall be suitable for mechanical handling with the IBC filled to its maximum permissible gross mass.
- 6.5.5.5.8** The pallet or integral base shall be designed so as to avoid any protrusion of the base of the IBC that might be liable to damage in handling.
- 6.5.5.5.9** The body shall be secured to any detachable pallet to ensure stability in handling and carriage. Where a detachable pallet is used, its top surface shall be free from sharp protrusions that might damage the IBC.
- 6.5.5.5.10** Strengthening devices such as timber supports to increase stacking performance may be used but shall be external to the liner.
- 6.5.5.5.11** Where IBCs are intended for stacking, the bearing surface shall be such as to distribute the load in a safe manner.
- 6.5.5.6 Specific requirements for wooden IBCs**
- 6.5.5.6.1** These requirements apply to wooden IBCs for the carriage of solids which are filled or discharged by gravity. Wooden IBCs are of the following types:
- 11C Natural wood with inner liner
  - 11D Plywood with inner liner
  - 11F Reconstituted wood with inner liner.
- 6.5.5.6.2** Wooden IBCs shall not incorporate top lifting devices.
- 6.5.5.6.3** The strength of the materials used and the method of construction of the body shall be appropriate to the capacity and intended use of the IBC.
- 6.5.5.6.4** Natural wood shall be well seasoned, commercially dry and free from defects that would materially lessen the strength of any part of the IBC. Each part of the IBC shall consist of one piece or be equivalent thereto. Parts are considered equivalent to one piece when a suitable method of glued assembly is used (as for instance Lindermann joint, tongue and groove joint, ship lap or rabbet joint); or butt joint with at least two corrugated metal fasteners at each joint, or when other methods at least equally effective are used.
- 6.5.5.6.5** Bodies of plywood shall be at least 3-ply. They shall be made of well seasoned rotary cut, sliced or sawn veneer, commercially dry and free from defects that would materially lessen the strength of the body. All adjacent plies shall be glued with water resistant adhesive. Other suitable materials may be used with plywood for the construction of the body.
- 6.5.5.6.6** Bodies of reconstituted wood shall be made of water resistant reconstituted wood such as hardboard, particle board or other suitable type.
- 6.5.5.6.7** IBCs shall be firmly nailed or secured to corner posts or ends or be assembled by equally suitable devices.
- 6.5.5.6.8** The liner shall be made of a suitable material. The strength of the material used and the construction of the liner shall be appropriate to the capacity of the IBC and the intended use. Joins and closures shall be siftproof and capable of withstanding pressures and impacts liable to occur under normal conditions of handling and carriage.
- 6.5.5.6.9** Any integral pallet base forming part of an IBC or any detachable pallet shall be suitable for mechanical handling with the IBC filled to its maximum permissible gross mass.
- 6.5.5.6.10** The pallet or integral base shall be designed so as to avoid any protrusion of the base of the IBC that might be liable to damage in handling.
- 6.5.5.6.11** The body shall be secured to any detachable pallet to ensure stability in handling and carriage. Where a detachable pallet is used, its top surface shall be free from sharp protrusions that might damage the IBC.
- 6.5.5.6.12** Strengthening devices such as timber supports to increase stacking performance may be used but shall be external to the liner.

**6.5.5.6.13** Where IBCs are intended for stacking, the bearing surface shall be such as to distribute the load in a safe manner.

## **6.5.6 Test requirements for IBCs**

### **6.5.6.1 Performance and frequency of tests**

**6.5.6.1.1** Each IBC design type shall successfully pass the tests prescribed in this Chapter before being used and being approved by the competent authority allowing the allocation of the mark. An IBC design type is defined by the design, size, material and thickness, manner of construction and means of filling and discharging but may include various surface treatments. It also includes IBCs which differ from the design type only in their lesser external dimensions.

**6.5.6.1.2** Tests shall be carried out on IBCs prepared for carriage. IBCs shall be filled as indicated in the relevant sections. The substances to be carried in the IBCs may be replaced by other substances except where this would invalidate the results of the tests. For solids, when another substance is used it shall have the same physical characteristics (mass, grain size, etc.) as the substance to be carried. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass, so long as they are placed so that the test results are not affected.

### **6.5.6.2 Design type tests**

**6.5.6.2.1** One IBC of each design type, size, wall thickness and manner of construction shall be submitted to the tests listed in the order shown in 6.5.6.3.7 and as set out in 6.5.6.5 to 6.5.6.13. These design type tests shall be carried out as required by the competent authority.

**6.5.6.2.2** To prove sufficient chemical compatibility with the contained goods or standard liquids in accordance with 6.5.6.3.3 or 6.5.6.3.5 for rigid plastics IBCs of type 31H2 and for composite IBCs of types 31HH1 and 31HH2, a second IBC may be used when the IBCs are designed to be stacked. In such case both IBCs shall be subjected to a preliminary storage.

**6.5.6.2.3** The competent authority may permit the selective testing of IBCs which differ only in minor respects from a tested type, e.g. with small reductions in external dimensions.

**6.5.6.2.4** If detachable pallets are used in the tests, the test report issued in accordance with 6.5.6.14 shall include a technical description of the pallets used.

### **6.5.6.3 Preparation of IBCs for testing**

**6.5.6.3.1** Paper and fibreboard IBCs and composite IBCs with fibreboard outer casings shall be conditioned for at least 24 hours in an atmosphere having a controlled temperature and relative humidity (r.h.). There are three options, one of which shall be chosen. The preferred atmosphere is  $23\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$  and  $50\% \pm 2\%$  r.h. The two other options are  $20\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$  and  $65\% \pm 2\%$  r.h.; or  $27\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$  and  $65\% \pm 2\%$  r.h.

**NOTE:** Average values shall fall within these limits. Short-term fluctuations and measurement limitations may cause individual measurements to vary by up to  $\pm 5\%$  relative humidity without significant impairment of test reproducibility.

**6.5.6.3.2** Additional steps shall be taken to ascertain that the plastics material used in the manufacture of rigid plastics IBCs (types 31H1 and 31H2) and composite IBCs (types 31HZ1 and 31HZ2) complies respectively with the requirements in 6.5.5.3.2 to 6.5.5.3.4 and 6.5.5.4.6 to 6.5.5.4.9.

**6.5.6.3.3** To prove there is sufficient chemical compatibility with the contained goods, the sample IBC shall be subjected to a preliminary storage for six months, during which the samples shall remain filled with the substances they are intended to contain or with substances which are known to have at least as severe a stress-cracking, weakening or molecular degradation influence on the plastics materials in question, and after which the samples shall be submitted to the applicable tests listed in the table in 6.5.6.3.7.

**6.5.6.3.4** Where the satisfactory behaviour of the plastics material has been established by other means, the above compatibility test may be dispensed with. Such procedures shall be at least equivalent to the above compatibility test and recognized by the competent authority.

**6.5.6.3.5** For polyethylene rigid plastics IBCs (types 31H1 and 31H2) in accordance with 6.5.5.3 and composite IBCs with polyethylene inner receptacle (types 31HZ1 and 31HZ2) in accordance with 6.5.5.4, chemical compatibility with filling liquids assimilated in accordance with 4.1.1.19 may be verified as follows with standard liquids (see 6.1.6).

The standard liquids are representative for the processes of deterioration on polyethylene, as there are softening through swelling, cracking under stress, molecular degradation and combinations thereof.

The sufficient chemical compatibility of the IBCs may be verified by storage of the required test samples for three weeks at  $40\text{ }^{\circ}\text{C}$  with the appropriate standard liquid(s); where this standard liquid is water, storage in accordance with this procedure is not required. Storage is not required either for test samples which are

used for the stacking test in case of the standard liquids wetting solution and acetic acid. After this storage, the test samples shall undergo the tests prescribed in 6.5.6.4 to 6.5.6.9.

The compatibility test for tert-Butyl hydroperoxide with more than 40% peroxide content and peroxyacetic acids of Class 5.2 shall not be carried out using standard liquids. For these substances, sufficient chemical compatibility of the test samples shall be verified during a storage period of six months at ambient temperature with the substances they are intended to carry.

Results of the procedure in accordance with this paragraph from polyethylene IBCs can be approved for an equal design type, the internal surface of which is fluorinated.

**6.5.6.3.6** For IBC design types, made of polyethylene, as specified in 6.5.6.3.5, which have passed the test in 6.5.6.3.5, the chemical compatibility with filling substances may also be verified by laboratory tests<sup>2</sup> proving that the effect of such filling substances on the test specimens is less than that of the appropriate standard liquid(s) taking into account the relevant processes of deterioration. The same conditions as those set out in 4.1.1.19.2 shall apply with respect to relative density and vapour pressure.

**6.5.6.3.7** Design type tests required and sequential order

Type of IBC	Vibration <sup>(f)</sup>	Bottom lift	Top lift <sup>(a)</sup>	Stacking <sup>(b)</sup>	Leak-proofness	Hydraulic pressure	Drop	Tear	Topple	Rigging <sup>(c)</sup>

<sup>(a)</sup> When IBCs are designed for this method of handling.

<sup>(b)</sup> When IBCs are designed to be stacked.

<sup>(c)</sup> When IBCs are designed to be lifted from the top or the side.

<sup>(d)</sup> Required test indicated by x; an IBC which has passed one test may be used for other tests, in any order.

<sup>2</sup> Laboratory tests for the proof of the chemical compatibility of polyethylene according to 6.5.6.3.5 proving that the effect of filling substances (substances, mixtures and preparations) is less than that of the standard liquids set out in 6.1.6 see guidelines in the non-legally binding part of RID published by the Secretariat of OTIF.

(e) Another IBC of the same design may be used for the drop test.

(f) Another IBC of the same design may be used for the vibration test.

(g) The second IBC in accordance with 6.5.6.2.2 can be used out of the sequential order direct after the preliminary storage.

#### **6.5.6.4 Bottom lift test**

##### **6.5.6.4.1 Applicability**

For all fibreboard and wooden IBCs, and for all types of IBC which are fitted with means of lifting from the base, as a design type test.

##### **6.5.6.4.2 Preparation of the IBC for test**

The IBC shall be filled. A load shall be added and evenly distributed. The mass of the filled IBC and the load shall be 1.25 times the maximum permissible gross mass.

##### **6.5.6.4.3 Method of testing**

The IBC shall be raised and lowered twice by a lift truck with the forks centrally positioned and spaced at three quarters of the dimension of the side of entry (unless the points of entry are fixed). The forks shall penetrate to three quarters of the direction of entry. The test shall be repeated from each possible direction of entry.

##### **6.5.6.4.4 Criteria for passing the test**

No permanent deformation which renders the IBC, including the base pallet, if any, unsafe for carriage and no loss of contents.

#### **6.5.6.5 Top lift test**

##### **6.5.6.5.1 Applicability**

For all types of IBC which are designed to be lifted from the top and for flexible IBCs designed to be lifted from the top or the side, as a design type test.

##### **6.5.6.5.2 Preparation of the IBC for test**

Metal, rigid plastics and composite IBCs shall be filled. A load shall be added and evenly distributed. The mass of the filled IBC and the load shall be twice the maximum permissible gross mass. Flexible IBCs shall be filled with a representative material and then shall be loaded to six times their maximum permissible gross mass, the load being evenly distributed.

##### **6.5.6.5.3 Methods of testing**

Metal and flexible IBCs shall be lifted in the manner for which they are designed until clear of the floor and maintained in that position for a period of five minutes.

Rigid plastics and composite IBCs shall be lifted:

- (a) by each pair of diagonally opposite lifting devices, so that the hoisting forces are applied vertically, for a period of five minutes; and
- (b) by each pair of diagonally opposite lifting devices, so that the hoisting forces are applied toward the centre at 45° to the vertical, for a period of five minutes.

##### **6.5.6.5.4 Other methods of top lift testing and preparation at least equally effective may be used for flexible IBCs.**

##### **6.5.6.5.5 Criteria for passing the test**

- (a) Metal, rigid plastics and composite IBCs: the IBC remains safe for normal conditions of carriage, there is no observable permanent deformation of the IBC, including the base pallet, if any, and no loss of contents;
- (b) Flexible IBCs: no damage to the IBC or its lifting devices which renders the IBC unsafe for carriage or handling and no loss of contents.

#### **6.5.6.6 Stacking test**

##### **6.5.6.6.1 Applicability**

For all types of IBC which are designed to be stacked on each other, as a design type test.

**6.5.6.6.2** Preparation of the IBC for test

The IBC shall be filled to its maximum permissible gross mass. If the specific gravity of the product being used for testing makes this impracticable, the IBC shall additionally be loaded so that it is tested at its maximum permissible gross mass the load being evenly distributed.

**6.5.6.6.3** Method of testing

(a) The IBC shall be placed on its base on level hard ground and subjected to a uniformly distributed superimposed test load (see 6.5.6.6.4). For rigid plastics IBCs of type 31H2 and composite IBCs of types 31HH1 and 31HH2, a stacking test shall be carried out with the original filling substance or a standard liquid (see 6.1.6) in accordance with 6.5.6.3.3 or 6.5.6.3.5 using the second IBC in accordance with 6.5.6.2.2 after the preliminary storage. IBCs shall be subjected to the test load for a period of at least:

- (i) 5 minutes, for metal IBCs;
- (ii) 28 days at 40 °C, for rigid plastics IBCs of types 11H2, 21H2 and 31H2 and for composite IBCs with outer casings of plastics material which bear the stacking load (i.e., types 11HH1, 11HH2, 21HH1, 21HH2, 31HH1 and 31HH2);
- (iii) 24 hours, for all other types of IBCs;

(b) The load shall be applied by one of the following methods:

- (i) one or more IBCs of the same type filled to the maximum permissible gross mass stacked on the test IBC;
- (ii) appropriate weights loaded on to either a flat plate or a reproduction of the base of the IBC, which is stacked on the test IBC.

**6.5.6.6.4** Calculation of superimposed test load

The load to be placed on the IBC shall be 1.8 times the combined maximum permissible gross mass of the number of similar IBCs that may be stacked on top of the IBC during carriage.

**6.5.6.6.5** Criteria for passing the test

- (a) All types of IBCs other than flexible IBCs: no permanent deformation which renders the IBC including the base pallet, if any, unsafe for carriage and no loss of contents.
- (b) Flexible IBCs: no deterioration of the body which renders the IBC unsafe for carriage and no loss of contents.

**6.5.6.7** Leakproofness test**6.5.6.7.1** Applicability

For those types of IBC used for liquids or for solids filled or discharged under pressure, as a design type test and periodic test.

**6.5.6.7.2** Preparation of the IBC for test

The test shall be carried out before the fitting of any thermal insulation equipment. Vented closures shall either be replaced by similar non-vented closures or the vent shall be sealed.

**6.5.6.7.3** Method of testing and pressure to be applied

The test shall be carried out for a period of at least 10 minutes using air at a gauge pressure of not less than 20 kPa (0.2 bar). The air tightness of the IBC shall be determined by a suitable method such as by air-pressure differential test or by immersing the IBC in water or, for metal IBCs, by coating the seams and joints with a soap solution. In the case of immersing a correction factor shall be applied for the hydrostatic pressure.

**6.5.6.7.4** Criterion for passing the test

No leakage of air.

**6.5.6.8** Internal pressure (hydraulic) test**6.5.6.8.1** Applicability

For those types of IBCs used for liquids or for solids filled or discharged under pressure, as a design type test.

**6.5.6.8.2** Preparation of the IBC for test

The test shall be carried out before the fitting of any thermal insulation equipment.

Pressure-relief devices shall be removed and their apertures plugged, or shall be rendered inoperative.

**6.5.6.8.3** Method of testing

The test shall be carried out for a period of at least 10 minutes applying a hydraulic pressure not less than that indicated in 6.5.6.8.4. The IBCs shall not be mechanically restrained during the test.

**6.5.6.8.4** Pressures to be applied

**6.5.6.8.4.1** Metal IBCs:

- (a) For IBCs of types 21A, 21B and 21N, for packing group I solids, a 250 kPa (2.5 bar) gauge pressure;
- (b) For IBCs of types 21A, 21B, 21N, 31A, 31B and 31N, for packing groups II or III substances, a 200 kPa (2 bar) gauge pressure;
- (c) In addition, for IBCs of types 31A, 31B and 31N, a 65kPa (0.65 bar) gauge pressure. This test shall be performed before the 200 kPa (2 bar) test.

**6.5.6.8.4.2** Rigid plastics and composite IBCs:

- (a) For IBCs of types 21H1, 21H2, 21HZ1 and 21HZ2: 75 kPa (0.75 bar) (gauge);
- (b) For IBCs of types 31H1, 31H2, 31HZ1 and 31HZ2: whichever is the greater of two values, the first as determined by one of the following methods:
  - (i) the total gauge pressure measured in the IBC (i.e. the vapour pressure of the filling substance and the partial pressure of the air or other inert gases, minus 100 kPa) at 55 °C multiplied by a safety factor of 1.5; this total gauge pressure shall be determined on the basis of a maximum degree of filling in accordance with 4.1.1.4 and a filling temperature of 15 °C;
  - (ii) 1.75 times the vapour pressure at 50 °C of the substance to be carried minus 100 kPa, but with a minimum test pressure of 100 kPa;
  - (iii) 1.5 times the vapour pressure at 55 °C of the substance to be carried minus 100 kPa, but with a minimum test pressure of 100 kPa;and the second as determined by the following method:
  - (iv) twice the static pressure of the substance to be carried, with a minimum of twice the static pressure of water;

**6.5.6.8.5** Criteria for passing the test(s):

- (a) For IBCs of types 21A, 21B, 21N, 31A, 31B and 31N, when subjected to the test pressure specified in 6.5.6.8.4.1 (a) or (b): no leakage;
- (b) For IBCs of types 31A, 31B and 31N, when subjected to the test pressure specified in 6.5.6.8.4.1 (c): no permanent deformation which renders the IBC unsafe for carriage and no leakage;
- (c) For rigid plastics and composite IBCs: no permanent deformation which would render the IBC unsafe for carriage and no leakage.

**6.5.6.9** Drop test

**6.5.6.9.1** Applicability

For all types of IBCs, as a design type test.

**6.5.6.9.2** Preparation of the IBC for test

- (a) Metal IBCs: the IBC shall be filled to not less than 95% of its maximum capacity for solids or 98% of its maximum capacity for liquids. Pressure-relief devices shall be removed and their apertures plugged, or shall be rendered inoperative;
- (b) Flexible IBCs: the IBC shall be filled to the maximum permissible gross mass, the contents being evenly distributed;
- (c) Rigid plastics and composite IBCs: the IBC shall be filled to not less than 95% of its maximum capacity for solids or 98% of its maximum capacity for liquids. Arrangements provided for pressure relief may be removed and plugged or rendered inoperative. Testing of IBCs shall be carried out when the temperature of the test sample and its contents has been reduced to minus 18 °C or lower. Where test samples of composite IBCs are prepared in this way the conditioning specified in 6.5.6.3.1 may be waived. Test liquids shall be kept in the liquid state, if necessary by the addition of anti-freeze. This conditioning may be disregarded if the materials in question are of sufficient ductility and tensile strength at low temperatures;
- (d) Fibreboard and wooden IBCs: The IBC shall be filled to not less than 95% of its maximum capacity.

**6.5.6.9.3** Method of testing

The IBC shall be dropped on its base onto a non-resilient, horizontal, flat, massive and rigid surface in conformity with the requirements of 6.1.5.3.4, in such a manner as to ensure that the point of impact is that part

of the base of the IBC considered to be the most vulnerable. IBCs of 0.45 m<sup>3</sup> or less capacity shall also be dropped:

- (a) Metal IBCs: on the most vulnerable part other than the part of the base tested in the first drop;
- (b) Flexible IBCs: on the most vulnerable side;
- (c) Rigid plastics, composite, fibreboard and wooden IBCs: flat on a side, flat on the top and on a corner.

The same or different IBCs may be used for each drop.

#### 6.5.6.9.4 Drop height

For solids and liquids, if the test is performed with the solid or liquid to be carried or with another substance having essentially the same physical characteristics:

Packing group I	Packing group II	Packing group III
1.8 m	1.2 m	0.8 m

For liquids if the test is performed with water:

- (a) Where the substances to be carried have a relative density not exceeding 1.2:

Packing group II	Packing group III
1.2 m	0.8 m

- (b) Where the substances to be carried have a relative density exceeding 1.2, the drop heights shall be calculated on the basis of the relative density (d) of the substance to be carried rounded up to the first decimal as follows:

Packing group II	Packing group III
d x 1.0 m	d x 0.67 m

#### 6.5.6.9.5 Criteria for passing the test(s):

- (a) Metal IBCs: no loss of contents;
- (b) Flexible IBCs: no loss of contents. A slight discharge, e.g. from closures or stitch holes, upon impact shall not be considered to be a failure of the IBC provided that no further leakage occurs after the IBC has been raised clear of the ground;
- (c) Rigid plastics, composite, fibreboard and wooden IBCs: no loss of contents. A slight discharge from a closure upon impact shall not be considered to be a failure of the IBC provided that no further leakage occurs;
- (d) All IBCs: no damage which renders the IBC unsafe to be carried for salvage or for disposal, and no loss of contents. In addition, the IBC shall be capable of being lifted by an appropriate means until clear of the floor for five minutes.

#### 6.5.6.10 Tear test

##### 6.5.6.10.1 Applicability

For all types of flexible IBCs, as a design type test.

##### 6.5.6.10.2 Preparation of the IBC for test

The IBC shall be filled to not less than 95% of its capacity and to its maximum permissible gross mass, the contents being evenly distributed.

##### 6.5.6.10.3 Method of testing

Once the IBC is placed on the ground, a 100 mm knife score, completely penetrating the wall of a wide face, is made at a 45° angle to the principal axis of the IBC, halfway between the bottom surface and the top level of the contents. The IBC shall then be subjected to a uniformly distributed superimposed load equivalent to twice the maximum permissible gross mass. The load shall be applied for at least five minutes. An IBC which is designed to be lifted from the top or the side shall then, after removal of the superimposed load, be lifted clear of the floor and maintained in that position for a period of five minutes.

##### 6.5.6.10.4 Criteria for passing the test

The cut shall not propagate more than 25% of its original length.

**6.5.6.11 Topple test****6.5.6.11.1** Applicability

For all types of flexible IBC, as a design type test.

**6.5.6.11.2** Preparation of the IBC for test

The IBC shall be filled to not less than 95% of its capacity and to its maximum permissible gross mass, the contents being evenly distributed.

**6.5.6.11.3** Method of testing

The IBC shall be caused to topple on to any part of its top on to a rigid, non-resilient, smooth, flat and horizontal surface.

**6.5.6.11.4** Topple height

Packing group I	Packing group II	Packing group III
1.8 m	1.2 m	0.8 m

**6.5.6.11.5** Criteria for passing the test

No loss of contents. A slight discharge, e.g. from closures or stitch holes, upon impact shall not be considered to be a failure of the IBC provided that no further leakage occurs.

**6.5.6.12 Righting test****6.5.6.12.1** Applicability

For all flexible IBCs designed to be lifted from the top or side, as a design type test.

**6.5.6.12.2** Preparation of the IBC for test

The IBC shall be filled to not less than 95% of its capacity and to its maximum permissible gross mass, the contents being evenly distributed.

**6.5.6.12.3** Method of testing

The IBC, lying on its side, shall be lifted at a speed of at least 0.1 m/s to upright position, clear of the floor, by one lifting device or by two lifting devices when four are provided.

**6.5.6.12.4** Criteria for passing the test

No damage to the IBC or its lifting devices which renders the IBC unsafe for carriage or handling.

**6.5.6.13 Vibration test****6.5.6.13.1** Applicability

For all IBCs used for liquids, as a design type test.

**NOTE:** This test applies to design types for IBCs manufactured after 31 December 2010 (see also 1.6.1.14).

**6.5.6.13.2** Preparation of the IBC for test

A sample IBC shall be selected at random and shall be fitted and closed as for carriage. The IBC shall be filled with water to not less than 98% of its maximum capacity.

**6.5.6.13.3** Test method and duration**6.5.6.13.3.1** The IBC shall be placed in the center of the test machine platform with a vertical sinusoidal, double amplitude (peak-to-peak displacement) of 25 mm  $\pm$  5%. If necessary, restraining devices shall be attached to the platform to prevent the specimen from moving horizontally off the platform without restricting vertical movement.**6.5.6.13.3.2** The test shall be conducted for one hour at a frequency that causes part of the base of the IBC to be momentarily raised from the vibrating platform for part of each cycle to such a degree that a metal shim can be completely inserted intermittently at, at least, one point between the base of the IBC and the test platform. The frequency may need to be adjusted after the initial set point to prevent the packaging from going into

resonance. Nevertheless, the test frequency shall continue to allow placement of the metal shim under the IBC as described in this paragraph. The continuing ability to insert the metal shim is essential to passing the test. The metal shim used for this test shall be at least 1.6 mm thick, 50 mm wide, and be of sufficient length to be inserted between the IBC and the test platform a minimum of 100 mm to perform the test.

**6.5.6.13.4** Criteria for passing the test

No leakage or rupture shall be observed. In addition, no breakage or failure of structural components, such as broken welds or failed fastenings, shall be observed.

**6.5.6.14** Test report

**6.5.6.14.1** A test report containing at least the following particulars shall be drawn up and shall be made available to the users of the IBC:

1. Name and address of the test facility;
2. Name and address of applicant (where appropriate);
3. A unique test report identification;
4. Date of the test report;
5. Manufacturer of the IBC;
6. Description of the IBC design type (e.g. dimensions, materials, closures, thickness, etc.) including method of manufacture (e.g. blow moulding) and which may include drawing(s) and/or photograph(s);
7. Maximum capacity;
8. Characteristics of test contents, e.g. viscosity and relative density for liquids and particle size for solids;
9. Test descriptions and results;
10. The test report shall be signed with the name and status of the signatory.

**6.5.6.14.2** The test report shall contain statements that the IBC prepared as for carriage was tested in accordance with the appropriate requirements of this Chapter and that the use of other packaging methods or components may render it invalid. A copy of the test report shall be available to the competent authority.

## Chapter 6.6

### Requirements for the construction and testing of large packagings

#### 6.6.1 General

##### 6.6.1.1 The requirements of this Chapter do not apply to:

- packagings for Class 2, except large packagings for articles, including aerosols;
- packagings for Class 6.2, except large packagings for clinical waste of UN No. 3291;
- Class 7 packages containing radioactive material.

##### 6.6.1.2 Large packagings shall be manufactured and tested under a quality assurance programme which satisfies the competent authority in order to ensure that each manufactured packaging meets the requirements of this Chapter.

**NOTE:** ISO 16106:2006 "Packaging – Transport packages for dangerous goods – Dangerous goods packagings, intermediate bulk containers (IBCs) and large packagings – Guidelines for the application of ISO 9001" provides acceptable guidance on procedures which may be followed.

##### 6.6.1.3 The specific requirements for large packagings in 6.6.4 are based on large packagings currently used. In order to take into account progress in science and technology, there is no objection to the use of large packagings having specifications different from those in 6.6.4 provided they are equally effective, acceptable to the competent authority and able successfully to withstand the tests described in 6.6.5. Methods of testing other than those described in RID are acceptable provided they are equivalent and are recognized by the competent authority.

##### 6.6.1.4 Manufacturers and subsequent distributors of packagings shall provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that packages as presented for carriage are capable of passing the applicable performance tests of this Chapter.

#### 6.6.2 Code for designating types of large packagings

##### 6.6.2.1 The code used for large packagings consist of:

###### (a) Two Arabic numerals:

- 50 for rigid large packagings; or
- 51 for flexible large packagings; and

###### (b) A capital letter in Latin character indicating the nature of the material, e.g. wood, steel etc. The capital letters used shall be those shown in 6.1.2.6.

##### 6.6.2.2 The letter "W" may follow the Large Packaging code. The letter "W" signifies that the large packaging, although of the same type indicated by the code, is manufactured to a specification different from those in 6.6.4 and is considered equivalent in accordance with the requirements in 6.6.1.3.

#### 6.6.3 Marking

##### 6.6.3.1 **Primary marking:** Each large packaging manufactured and intended for use in accordance with the provisions of RID shall bear durable and legible markings showing:

- (a) The United Nations packaging symbol . This symbol shall not be used for any purpose other than certifying that a packaging complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5 or 6.6. For metal large packagings on which the marking is stamped or embossed, the capital letters "UN" may be applied instead of the symbol;
- (b) The number "50" designating a large rigid packaging or "51" for flexible large packagings, followed by the material type in accordance with 6.5.1.4.1 (b);
- (c) A capital letter designating the packing group(s) for which the design type has been approved:
  - X for packing groups I, II and III
  - Y for packing groups II and III
  - Z for packing group III only;
- (d) The month and year (last two digits) of manufacture;
- (e) The State authorizing the allocation of the mark; indicated by the distinguishing sign for motor vehicles in international traffic<sup>1</sup>;

<sup>1</sup> Distinguishing sign for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

- (f) The name or symbol of the manufacturer and other identification of the large packagings as specified by the competent authority;
- (g) The stacking test load in kg. For large packagings not designed for stacking the figure "0" shall be shown;
- (h) The maximum permissible gross mass in kilograms.

The primary marking required above shall be applied in the sequence of the sub-paragraphs.

Each element of the marking applied in accordance with (a) to (h) shall be clearly separated, e.g. by a slash or space, so as to be easily identifiable.

#### 6.6.3.2 Examples of the marking:

	50A/X/0501/N/PQRS 2500/1000	For a large steel packaging suitable for stacking; stacking load: 2500 kg; maximum gross mass: 1000 kg
	50H/Y/0402/D/ABCD 987 0/800	For a large plastics packaging not suitable for stacking; maximum gross mass: 800 kg
	51H/Z/0601/S/1999 0/500	For a large flexible packaging not suitable for stacking; maximum gross mass: 500 kg

#### 6.6.4 Specific requirements for large packagings

##### 6.6.4.1 Specific requirements for metal large packagings

50A steel  
50B aluminium  
50N metal (other than steel or aluminium)

**6.6.4.1.1** The large packaging shall be made of suitable ductile metal in which the weldability has been fully demonstrated. Welds shall be skilfully made and afford complete safety. Low-temperature performance shall be taken into account when appropriate.

**6.6.4.1.2** Care shall be taken to avoid damage by galvanic action due to the juxtaposition of dissimilar metals.

##### 6.6.4.2 Specific requirements for flexible material large packagings

51H flexible plastics  
51M flexible paper

**6.6.4.2.1** The large packaging shall be manufactured from suitable materials. The strength of the material and the construction of the flexible large packagings shall be appropriate to its capacity and its intended use.

**6.6.4.2.2** All materials used in the construction of flexible large packagings of types 51M shall, after complete immersion in water for not less than 24 hours, retain at least 85% of the tensile strength as measured originally on the material conditioned to equilibrium at 67% relative humidity or less.

**6.6.4.2.3** Seams shall be formed by stitching, heat sealing, glueing or any equivalent method. All stitched seam-ends shall be secured.

**6.6.4.2.4** Flexible large packagings shall provide adequate resistance to ageing and to degradation caused by ultraviolet radiation or the climatic conditions, or by the substance contained, thereby rendering them appropriate to their intended use.

**6.6.4.2.5** For plastics flexible large packagings where protection against ultraviolet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the large packaging. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.

**6.6.4.2.6** Additives may be incorporated into the material of the large packaging to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.

**6.6.4.2.7** When filled, the ratio of height to width shall be not more than 2:1.

**6.6.4.3 Specific requirements for plastics large packagings**

50H rigid plastics

**6.6.4.3.1** The large packaging shall be manufactured from suitable plastics material of known specifications and be of adequate strength in relation to its capacity and its intended use. The material shall be adequately resistant to ageing and to degradation caused by the substance contained or, where relevant, by ultraviolet radiation. Low temperature performance shall be taken into account when appropriate. Any permeation of the substance contained shall not constitute a danger under normal conditions of carriage.

**6.6.4.3.2** Where protection against ultraviolet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the outer packaging. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.

**6.6.4.3.3** Additives may be incorporated in the material of the large packaging to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.

**6.6.4.4 Specific requirements for fibreboard large packagings**

50G rigid fibreboard

**6.6.4.4.1** Strong and good quality solid or double-faced corrugated fibreboard (single or multiwall) shall be used, appropriate to the capacity of the large packagings and to their intended use. The water resistance of the outer surface shall be such that the increase in mass, as determined in a test carried out over a period of 30 minutes by the Cobb method of determining water absorption, is not greater than  $155 \text{ g/m}^2$  – see ISO 535:1991. It shall have proper bending qualities. Fibreboard shall be cut, creased without scoring, and slotted so as to permit assembly without cracking, surface breaks or undue bending. The fluting or corrugated fibreboard shall be firmly glued to the facings.

**6.6.4.4.2** The walls, including top and bottom, shall have a minimum puncture resistance of 15 J measured according to ISO 3036:1975.

**6.6.4.4.3** Manufacturing joints in the outer packaging of large packagings shall be made with an appropriate overlap and shall be taped, glued, stitched with metal staples or fastened by other means at least equally effective. Where joints are effected by gluing or taping, a water resistant adhesive shall be used. Metal staples shall pass completely through all pieces to be fastened and be formed or protected so that any inner liner cannot be abraded or punctured by them.

**6.6.4.4.4** Any integral pallet base forming part of a large packaging or any detachable pallet shall be suitable for mechanical handling with the large packaging filled to its maximum permissible gross mass.

**6.6.4.4.5** The pallet or integral base shall be designed so as to avoid any protrusion of the base of the large packaging that might be liable to damage in handling.

**6.6.4.4.6** The body shall be secured to any detachable pallet to ensure stability in handling and carriage. Where a detachable pallet is used, its top surface shall be free from sharp protrusions that might damage the large packaging.

**6.6.4.4.7** Strengthening devices such as timber supports to increase stacking performance may be used but shall be external to the liner.

**6.6.4.4.8** Where large packagings are intended for stacking, the bearing surface shall be such as to distribute the load in a safe manner.

**6.6.4.5 Specific requirements for wooden large packagings**

50C natural wood

50D plywood

50F reconstituted wood

**6.6.4.5.1** The strength of the materials used and the method of construction shall be appropriate to the capacity and intended use of the large packagings.

**6.6.4.5.2** Natural wood shall be well seasoned, commercially dry and free from defects that would materially lessen the strength of any part of the large packagings. Each part of the large packagings shall consist of one piece or be equivalent thereto. Parts are considered equivalent to one piece when a suitable method of glued assembly is used as for instance Lindermann joint, tongue and groove joint, ship lap or rabbet joint; or butt joint with at least two corrugated metal fasteners at each joint, or when other methods at least equally effective are used.

- 6.6.4.5.3** Large packagings of plywood shall be at least 3-ply. They shall be made of well seasoned rotary cut, sliced or sawn veneer, commercially dry and free from defects that would materially lessen the strength of the large packaging. All adjacent plies shall be glued with water resistant adhesive. Other suitable materials may be used with plywood for the construction of the large packaging.
- 6.6.4.5.4** Large packagings of reconstituted wood shall be made of water resistant reconstituted wood such as hard-board, particle board or other suitable type.
- 6.6.4.5.5** Large packagings shall be firmly nailed or secured to corner posts or ends or be assembled by equally suitable devices.
- 6.6.4.5.6** Any integral pallet base forming part of a large packaging or any detachable pallet shall be suitable for mechanical handling with the large packaging filled to its maximum permissible gross mass.
- 6.6.4.5.7** The pallet or integral base shall be designed so as to avoid any protrusion of the base of the large packaging that might be liable to damage in handling.
- 6.6.4.5.8** The body shall be secured to any detachable pallet to ensure stability in handling and carriage. Where a detachable pallet is used, its top surface shall be free from sharp protrusions that might damage the large packaging.
- 6.6.4.5.9** Strengthening devices such as timber supports to increase stacking performance may be used but shall be external to the liner.
- 6.6.4.5.10** Where large packagings are intended for stacking, the bearing surface shall be such as to distribute the load in a safe manner.
- 6.6.5 Test requirements for large packagings**
- 6.6.5.1 Performance and frequency of test**
- 6.6.5.1.1** The design type of each large packaging shall be tested as provided in 6.6.5.3 in accordance with procedures established by the competent authority allowing the allocation of the mark and shall be approved by this competent authority.
- 6.6.5.1.2** Each large packaging design type shall successfully pass the tests prescribed in this Chapter before being used. A large packaging design type is defined by the design, size, material and thickness, manner of construction and packing, but may include various surface treatments. It also includes large packagings which differ from the design type only in their lesser design height.
- 6.6.5.1.3** Tests shall be repeated on production samples at intervals established by the competent authority. For such tests on fibreboard large packagings, preparation at ambient conditions is considered equivalent to the provisions of 6.6.5.2.4.
- 6.6.5.1.4** Tests shall also be repeated after each modification which alters the design, material or manner of construction of large packagings.
- 6.6.5.1.5** The competent authority may permit the selective testing of large packagings that differ only in minor respects from a tested type, e.g. smaller sizes of inner packagings or inner packagings of lower net mass; and large packagings which are produced with small reductions in external dimension(s).
- 6.6.5.1.6** (Reserved)  
**NOTE:** For the conditions for assembling different inner packagings in a large packaging and permissible variations in inner packagings, see 4.1.1.5.1.
- 6.6.5.1.7** The competent authority may at any time require proof, by tests in accordance with this section, that serially-produced large packagings meet the requirements of the design type tests.
- 6.6.5.1.8** Provided the validity of the test results is not affected and with the approval of the competent authority, several tests may be made on one sample.
- 6.6.5.2 Preparation for testing**
- 6.6.5.2.1** Tests shall be carried out on large packagings prepared as for carriage including the inner packagings or articles used. Inner packagings shall be filled to not less than 98% of their maximum capacity for liquids or 95% for solids. For large packagings where the inner packagings are designed to carry liquids and solids, separate testing is required for both liquid and solid contents. The substances in the inner packagings or the articles to be carried in the large packagings may be replaced by other material or articles except where this would invalidate the results of the tests. When other inner packagings or articles are used they shall have the same physical characteristics (mass, etc) as the inner packagings or articles to be carried. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass, so long as they are placed so that the test results are not affected.

**6.6.5.2.2** In the drop tests for liquids, when another substance is used, its relative density and viscosity shall be similar to those of the substance to be carried. Water may also be used for the liquid drop test under the following conditions:

- (a) where the substances to be carried have a relative density not exceeding 1.2, the drop heights shall be those shown in the table in 6.6.5.3.4.4;
- (b) where the substances to be carried have a relative density exceeding 1.2, the drop heights shall be calculated on the basis of the relative density ( $d$ ) of the substance to be carried rounded up to the first decimal as follows:

Packing group I	Packing group II	Packing group III
$d \times 1.5 \text{ m}$	$d \times 1.0 \text{ m}$	$d \times 0.67 \text{ m}$

**6.6.5.2.3** Large packagings made of plastics materials and large packagings containing inner packagings of plastic materials - other than bags intended to contain solids or articles - shall be drop tested when the temperature of the test sample and its contents has been reduced to  $-18^\circ\text{C}$  or lower. This conditioning may be disregarded if the materials in question are of sufficient ductility and tensile strength at low temperatures. Where test sample are prepared in this way, the conditioning in 6.6.5.2.4 may be waived. Test liquids shall be kept in the liquid state by the addition of anti-freeze if necessary.

**6.6.5.2.4** Large packagings of fibreboard shall be conditioned for at least 24 hours in an atmosphere having a controlled temperature and relative humidity (r.h.). There are three options, one of which shall be chosen.

The preferred atmosphere is  $23^\circ\text{C} \pm 2^\circ\text{C}$  and  $50\% \pm 2\%$  r.h. The two other options are:  $20^\circ\text{C} \pm 2^\circ\text{C}$  and  $65\% \pm 2\%$  r.h.; or  $27^\circ\text{C} \pm 2^\circ\text{C}$  and  $65\% \pm 2\%$  r.h.

**NOTE:** Average values shall fall within these limits. Short term fluctuations and measurement limitations may cause individual measurements to vary by up to  $\pm 5\%$  relative humidity without significant impairment of test reproducibility.

### **6.6.5.3 Test requirements**

#### **6.6.5.3.1 Bottom lift test**

##### **6.6.5.3.1.1 Applicability**

For all types of large packagings which are fitted with means of lifting from the base, as a design type test.

##### **6.6.5.3.1.2 Preparation of large packaging for test**

The large packaging shall be loaded to 1.25 times its maximum permissible gross mass, the load being evenly distributed.

##### **6.6.5.3.1.3 Method of testing**

The large packaging shall be raised and lowered twice by a lift truck with the forks centrally positioned and spaced at three quarters of the dimension of the side of entry (unless the points of entry are fixed). The forks shall penetrate to three quarters of the direction of entry. The test shall be repeated from each possible direction of entry.

##### **6.6.5.3.1.4 Criteria for passing the test**

No permanent deformation which renders the large packaging unsafe for carriage and no loss of contents.

#### **6.6.5.3.2 Top lift test**

##### **6.6.5.3.2.1 Applicability**

For types of large packagings which are intended to be lifted from the top and fitted with means of lifting, as a design type test.

##### **6.6.5.3.2.2 Preparation of large packaging for test**

The large packaging shall be loaded to twice its maximum permissible gross mass. A flexible large packaging shall be loaded to six times its maximum permissible gross mass, the load being evenly distributed.

##### **6.6.5.3.2.3 Method of testing**

The large packaging shall be lifted in the manner for which it is designed until clear of the floor and maintained in that position for a period of five minutes.

**6.6.5.3.2.4** Criteria for passing the test

- (a) Metal and rigid plastics large packagings: no permanent deformation which renders the large packaging, including the base pallet, if any, unsafe for carriage and no loss of contents.
- (b) Flexible large packagings: no damage to the large packaging or its lifting devices which renders the large packaging unsafe for carriage or handling and no loss of contents.

**6.6.5.3.3 Stacking test****6.6.5.3.3.1** Applicability

For all types of large packagings which are designed to be stacked on each other, as a design type test.

**6.6.5.3.3.2** Preparation of large packaging for test

The large packaging shall be filled to its maximum permissible gross mass.

**6.6.5.3.3.3** Method of testing

The large packaging shall be placed on its base on level hard ground and subjected to a uniformly distributed superimposed test load (see 6.6.5.3.3.4) for a period of at least five minutes, large packagings of wood, fibreboard and plastics materials for a period of 24 h.

**6.6.5.3.3.4** Calculation of superimposed test load

The load to be placed on the large packagings shall be 1.8 times the combined maximum permissible gross mass of the number of similar large packagings that may be stacked on top of the large packagings during carriage.

**6.6.5.3.3.5** Criteria for passing the test

- (a) All types of large packaging other than flexible large packagings: no permanent deformation which renders the large packaging including the base pallet, if any, unsafe for carriage and no loss of contents.
- (b) Flexible large packagings: no deterioration of the body which renders the large packaging unsafe for carriage and no loss of contents.

**6.6.5.3.4 Drop test****6.6.5.3.4.1** Applicability

For all types of large packagings as a design type test.

**6.6.5.3.4.2** Preparation of large packaging for testing

The large packaging shall be filled in accordance with 6.6.5.2.1

**6.6.5.3.4.3** Method of testing

The large packaging shall be dropped onto a non resilient, horizontal, flat, massive and rigid surface in conformity with the requirements of 6.1.5.3.4, in such a manner as to ensure that the point of impact is that part of the base of the large packaging considered to be the most vulnerable.

**6.6.5.3.4.4** Drop height

Packing group I	Packing group II	Packing group III
1.8 m	1.2 m	0.8 m

**NOTE:** Large packagings for substances and articles of Class 1, self-reactive substances of Class 4.1 and organic peroxides of Class 5.2 shall be tested at the packing group II performance level.

**6.6.5.3.4.5** Criteria for passing the test

**6.6.5.3.4.5.1** The large packaging shall not exhibit any damage liable to affect safety during carriage. There shall be no leakage of the filling substance from inner packaging(s) or article(s).

**6.6.5.3.4.5.2** No rupture is permitted in large packagings for articles of Class 1 which would permit the spillage of loose explosive substances or articles from the large packaging.

**6.6.5.3.4.5.3** Where a large packaging undergoes a drop test, the sample passes the test if the entire contents are retained even if the closure is no longer sift-proof.

**6.6.5.4 Certification and test report**

**6.6.5.4.1** In respect of each design type of large packaging a certificate and mark (as in 6.6.3) shall be issued attesting that the design type including its equipment meets the test requirements.

**6.6.5.4.2** A test report containing at least the following particulars shall be drawn up and shall be made available to the users of the large packaging:

1. Name and address of the test facility;
2. Name and address of applicant (where appropriate);
3. A unique test report identification;
4. Date of the test report;
5. Manufacturer of the large packaging;
6. Description of the large packaging design type (e.g. dimensions, materials, closures, thickness, etc) and/or photograph(s);
7. Maximum capacity/maximum permissible gross mass;
8. Characteristics of test contents, e.g. types and descriptions of inner packagings or articles used;
9. Test descriptions and results;
10. The test report shall be signed with the name and status of the signatory.

**6.6.5.4.3** The test report shall contain statements that the large packaging prepared as for carriage was tested in accordance with the appropriate provisions of this Chapter and that the use of other packaging methods or components may render it invalid. A copy of the test report shall be available to the competent authority.

## Chapter 6.7

### Requirements for the design, construction, inspection and testing of portable tanks and UN multiple element gas containers (MEGCs)

**NOTE:** For tank-wagons, demountable tanks and tank-containers and tank swap bodies, with shells made of metallic materials, and battery-wagons and multiple element gas containers (MEGCs), other than UN MEGCs see Chapter 6.8; for fibre-reinforced plastics tank-containers, see Chapter 6.9; for vacuum-operated waste tanks, see Chapter 6.10.

#### 6.7.1 Application and general requirements

**6.7.1.1** The requirements of this Chapter apply to portable tanks intended for the carriage of dangerous goods, and to MEGCs intended for the carriage of non-refrigerated gases of Class 2, by all modes of carriage. In addition to the requirements of this Chapter, unless otherwise specified, the applicable requirements of the International Convention for Safe Containers (CSC) 1972, as amended, shall be fulfilled by any multimodal portable tank or MEGC which meets the definition of a "container" within the terms of that Convention. Additional requirements may apply to offshore portable tanks or MEGCs that are handled in open seas.

**6.7.1.2** In recognition of scientific and technological advances, the technical requirements of this Chapter may be varied by alternative arrangements. These alternative arrangements shall offer a level of safety not less than that given by the requirements of this Chapter with respect to the compatibility with substances carried and the ability of the portable tank or MEGC to withstand impact, loading and fire conditions. For international carriage, alternative arrangement portable tanks or MEGCs shall be approved by the applicable competent authorities.

**6.7.1.3** When a substance is not assigned a portable tank instruction (T1 to T23, T50 or T75) in Column (10) of Table A of in Chapter 3.2, interim approval for carriage may be issued by the competent authority of the country of origin. The approval shall be included in the documentation of the consignment and contain as a minimum the information normally provided in the portable tank instructions and the conditions under which the substance shall be carried.

#### 6.7.2 Requirements for the design, construction, inspection and testing of portable tanks intended for the carriage of substances of Class 1 and Classes 3 to 9

##### 6.7.2.1 Definitions

For the purposes of this section:

*Alternative arrangement* means an approval granted by the competent authority for a portable tank or MEGC that has been designed, constructed or tested to technical requirements or testing methods other than those specified in this Chapter:

*Design pressure* means the pressure to be used in calculations required by a recognized pressure vessel code. The design pressure shall be not less than the highest of the following pressures:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The sum of:
  - (i) the absolute vapour pressure (in bar) of the substance at 65 °C, minus 1 bar;
  - (ii) the partial pressure (in bar) of air or other gases in the ullage space being determined by a maximum ullage temperature of 65 °C and a liquid expansion due to an increase in mean bulk temperature of  $t_r - t_f$  ( $t_f$  = filling temperature usually 15 °C;  $t_r$  = maximum mean bulk temperature, 50 °C); and
  - (iii) a head pressure determined on the basis of the static forces specified in 6.7.2.2.12, but not less than 0.35 bar; or
- (c) Two thirds of the minimum test pressure specified in the applicable portable tank instruction in 4.2.5.2.6;

*Design temperature range* for the shell shall be -40 °C to 50 °C for substances carried under ambient conditions. For the other substances handled under elevated temperature conditions the design temperature shall be not less than the maximum temperature of the substance during filling, discharge or carriage. More severe design temperatures shall be considered for portable tanks subjected to severe climatic conditions;

*Fine grain steel* means steel which has a ferritic grain size of 6 or finer when determined in accordance with ASTM E 112-96 or as defined in EN 10028-3, Part 3;

*Fusible element* means a non-reclosable pressure relief device that is thermally actuated;

*Leakproofness test* means a test using gas subjecting the shell and its service equipment to an effective internal pressure of not less than 25% of the MAWP;

*Maximum allowable working pressure (MAWP)* means a pressure that shall be not less than the highest of the following pressures measured at the top of the shell while in operating position:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The maximum effective gauge pressure to which the shell is designed which shall be not less than the sum of:
  - (i) the absolute vapour pressure (in bar) of the substance at 65 °C, minus 1 bar; and
  - (ii) the partial pressure (in bar) of air or other gases in the ullage space being determined by a maximum ullage temperature of 65 °C and a liquid expansion due to an increase in mean bulk temperature of  $t_r - t_f$  ( $t_f$  = filling temperature, usually 15 °C;  $t_r$  = maximum mean bulk temperature, 50 °C);

*Maximum permissible gross mass (MPGM)* means the sum of the tare mass of the portable tank and the heaviest load authorized for carriage;

*Mild steel* means a steel with a guaranteed minimum tensile strength of 360 N/mm<sup>2</sup> to 440 N/mm<sup>2</sup> and a guaranteed minimum elongation at fracture conforming to 6.7.2.3.3.3;

*Offshore portable tank* means a portable tank specially designed for repeated use for carriage to, from and between offshore facilities. An offshore portable tank is designed and constructed in accordance with the guidelines for the approval of containers handled in open seas specified by the International Maritime Organization in document MSC/Circ.860;

*Portable tank* means a multimodal tank used for the carriage of substances of Class 1 and Classes 3 to 9. The portable tank includes a shell fitted with service equipment and structural equipment necessary for the carriage of dangerous substances. The portable tank shall be capable of being filled and discharged without the removal of its structural equipment. It shall possess stabilizing members external to the shell, and shall be capable of being lifted when full. It shall be designed primarily to be loaded onto a vehicle, wagon or sea-going or inland navigation vessel and shall be equipped with skids, mountings or accessories to facilitate mechanical handling. Tank-vehicles, tank-wagons, non-metallic tanks and intermediate bulk containers (IBCs) are not considered to fall within the definition for portable tanks;

*Reference steel* means a steel with a tensile strength of 370 N/mm<sup>2</sup> and an elongation at fracture of 27%;

*Service equipment* means measuring instruments and filling, discharge, venting, safety, heating, cooling and insulating devices;

*Shell* means the part of the portable tank which retains the substance intended for carriage (tank proper), including openings and their closures, but does not include service equipment or external structural equipment;

*Structural equipment* means the reinforcing, fastening, protective and stabilizing members external to the shell;

*Test pressure* means the maximum gauge pressure at the top of the shell during the hydraulic pressure test equal to not less than 1.5 times the design pressure. The minimum test pressure for portable tanks intended for specific substances is specified in the applicable portable tank instruction in 4.2.5.2.6.

## **6.7.2.2 General design and construction requirements**

- 6.7.2.2.1** Shells shall be designed and constructed in accordance with the requirements of a pressure vessel code recognized by the competent authority. Shells shall be made of metallic materials suitable for forming. The materials shall in principle conform to national or international material standards. For welded shells only a material whose weldability has been fully demonstrated shall be used. Welds shall be skilfully made and afford complete safety. When the manufacturing process or the materials make it necessary, the shells shall be suitably heat-treated to guarantee adequate toughness in the weld and in the heat affected zones. In choosing the material, the design temperature range shall be taken into account with respect to risk of brittle fracture, to stress corrosion cracking and to resistance to impact. When fine grain steel is used, the guaranteed value of the yield strength shall be not more than 460 N/mm<sup>2</sup> and the guaranteed value of the upper limit of the tensile strength shall be not more than 725 N/mm<sup>2</sup> according to the material specification. Aluminium may only be used as a construction material when indicated in a portable tank special provision assigned to a specific substance in Column (11) of Table A of Chapter 3.2 or when approved by the competent authority. When aluminium is authorized, it shall be insulated to prevent significant loss of physical properties when subjected to a heat load of 110 kW/m<sup>2</sup> for a period of not less than 30 minutes. The insulation shall remain effective at all temperatures less than 649 °C and shall be jacketed with a material with a melting point of not less than 700 °C. Portable tank materials shall be suitable for the external environment in which they may be carried.

- 6.7.2.2.2** Portable tank shells, fittings, and pipework shall be constructed from materials which are:
- (a) Substantially immune to attack by the substance(s) intended to be carried; or
  - (b) Properly passivated or neutralized by chemical reaction; or
  - (c) Lined with corrosion-resistant material directly bonded to the shell or attached by equivalent means.
- 6.7.2.2.3** Gaskets shall be made of materials not subject to attack by the substance(s) intended to be carried.
- 6.7.2.2.4** When shells are lined, the lining shall be substantially immune to attack by the substance(s) intended to be carried, homogeneous, non porous, free from perforations, sufficiently elastic and compatible with the thermal expansion characteristics of the shell. The lining of every shell, shell fittings and piping shall be continuous, and shall extend around the face of any flange. Where external fittings are welded to the tank, the lining shall be continuous through the fitting and around the face of external flanges.
- 6.7.2.2.5** Joints and seams in the lining shall be made by fusing the material together or by other equally effective means.
- 6.7.2.2.6** Contact between dissimilar metals which could result in damage by galvanic action shall be avoided.
- 6.7.2.2.7** The materials of the portable tank, including any devices, gaskets, linings and accessories, shall not adversely affect the substance(s) intended to be carried in the portable tank.
- 6.7.2.2.8** Portable tanks shall be designed and constructed with supports to provide a secure base during carriage and with suitable lifting and tie-down attachments.
- 6.7.2.2.9** Portable tanks shall be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and carriage. The design shall demonstrate that the effects of fatigue, caused by repeated application of these loads through the expected life of the portable tank, have been taken into account.
- 6.7.2.2.10** A shell which is to be equipped with a vacuum-relief device shall be designed to withstand, without permanent deformation, an external pressure of not less than 0.21 bar above the internal pressure. The vacuum-relief device shall be set to relieve at a vacuum setting not greater than minus (–)0.21 bar unless the shell is designed for a higher external over pressure, in which case the vacuum-relief pressure of the device to be fitted shall be not greater than the tank design vacuum pressure. A shell used for the carriage of solid substances (powdery or granular) of packing groups II or III only, which do not liquefy during carriage, may be designed for a lower external pressure, subject to the approval of the competent authority. In this case, the vacuum valve shall be set to relieve at this lower pressure. A shell that is not to be fitted with a vacuum-relief device shall be designed to withstand, without permanent deformation an external pressure of not less than 0.4 bar above the internal pressure.
- 6.7.2.2.11** Vacuum-relief devices used on portable tanks intended for the carriage of substances meeting the flash-point criteria of Class 3, including elevated temperature substances carried at or above their flash-point, shall prevent the immediate passage of flame into the shell, or the portable tank shall have a shell capable of withstanding, without leakage an internal explosion resulting from the passage of flame into the shell.
- 6.7.2.2.12** Portable tanks and their fastenings shall, under the maximum permissible load, be capable of absorbing the following separately applied static forces:
- (a) In the direction of travel: twice the MPGM multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>;
  - (b) Horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces shall be equal to twice the MPGM) multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>;
  - (c) Vertically upwards: the MPGM multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>; and
  - (d) Vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>.
- 6.7.2.2.13** Under each of the forces in 6.7.2.2.12, the safety factor to be observed shall be as follows:
- (a) For metals having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; or
  - (b) For metals with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength and, for austenitic steels, the 1% proof strength.

---

<sup>1</sup> For calculation purposes  $g = 9.81 \text{ m/s}^2$ .

- 6.7.2.2.14** The values of yield strength or proof strength shall be the values according to national or international material standards. When austenitic steels are used, the specified minimum values of yield strength or proof strength according to the material standards may be increased by up to 15% when these greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, the value of yield strength or proof strength used shall be approved by the competent authority.
- 6.7.2.2.15** Portable tanks shall be capable of being electrically earthed when intended for the carriage of substances meeting the flash-point criteria of Class 3 including elevated temperature substances carried at or above their flash-point. Measures shall be taken to prevent dangerous electrostatic discharge.
- 6.7.2.2.16** When required for certain substances by the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column (11) of Table A of Chapter 3.2 and described in 4.2.5.3, portable tanks shall be provided with additional protection, which may take the form of additional shell thickness or a higher test pressure, the additional shell thickness or higher test pressure being determined in the light of the inherent risks associated with the carriage of the substances concerned.
- 6.7.2.3 Design criteria**
- 6.7.2.3.1** Shells shall be of a design capable of being stress-analysed mathematically or experimentally by resistance strain gauges, or by other methods approved by the competent authority.
- 6.7.2.3.2** Shells shall be designed and constructed to withstand a hydraulic test pressure not less than 1.5 times the design pressure. Specific requirements are laid down for certain substances in the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column (11) of Table A of Chapter 3.2 and described in 4.2.5.3. Attention is drawn to the minimum shell thickness requirements specified in 6.7.2.4.1 to 6.7.2.4.10.
- 6.7.2.3.3** For metals exhibiting a clearly defined yield point or characterized by a guaranteed proof strength (0.2% proof strength, generally, or 1% proof strength for austenitic steels) the primary membrane stress  $\sigma$  (sigma) in the shell shall not exceed  $0.75 R_e$  or  $0.50 R_m$ , whichever is lower, at the test pressure, where:  
 $R_e$  = yield strength in  $N/mm^2$ , or 0.2% proof strength or, for austenitic steels, 1% proof strength;  
 $R_m$  = minimum tensile strength in  $N/mm^2$ .
- 6.7.2.3.3.1** The values of  $R_e$  and  $R_m$  to be used shall be the specified minimum values according to national or international material standards. When austenitic steels are used, the specified minimum values for  $R_e$  and  $R_m$  according to the material standards may be increased by up to 15% when greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, the values of  $R_e$  and  $R_m$  used shall be approved by the competent authority or its authorized body.
- 6.7.2.3.3.2** Steels which have a  $R_e/R_m$  ratio of more than 0.85 are not allowed for the construction of welded shells. The values of  $R_e$  and  $R_m$  to be used in determining this ratio shall be the values specified in the material inspection certificate.
- 6.7.2.3.3.3** Steels used in the construction of shells shall have an elongation at fracture, in %, of not less than  $10\,000/R_m$  with an absolute minimum of 16% for fine grain steels and 20% for other steels. Aluminium and aluminium alloys used in the construction of shells shall have an elongation at fracture, in %, of not less than  $10\,000/6R_m$  with an absolute minimum of 12%.
- 6.7.2.3.3.4** For the purpose of determining actual values for materials, it shall be noted that for sheet metal, the axis of the tensile test specimen shall be at right angles (transversely) to the direction of rolling. The permanent elongation at fracture shall be measured on test specimens of rectangular cross sections in accordance with ISO 6892:1998 using a 50 mm gauge length.
- 6.7.2.4 Minimum shell thickness**
- 6.7.2.4.1** The minimum shell thickness shall be the greater thickness based on:
- The minimum thickness determined in accordance with the requirements of 6.7.2.4.2 to 6.7.2.4.10;
  - The minimum thickness determined in accordance with the recognized pressure vessel code including the requirements in 6.7.2.3; and
  - The minimum thickness specified in the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column (11) of Table A of Chapter 3.2 and described in 4.2.5.3.

- 6.7.2.4.2** The cylindrical portions, ends (heads) and manhole covers of shells not more than 1.80 m in diameter shall be not less than 5 mm thick in the reference steel or of equivalent thickness in the metal to be used. Shells more than 1.80 m in diameter shall be not less than 6 mm thick in the reference steel or of equivalent thickness in the metal to be used, except that for powdered or granular solid substances of packing group II or III the minimum thickness requirement may be reduced to not less than 5 mm thick in the reference steel or of equivalent thickness in the metal to be used.
- 6.7.2.4.3** When additional protection against shell damage is provided, portable tanks with test pressures less than 2.65 bar may have the minimum shell thickness reduced, in proportion to the protection provided, as approved by the competent authority. However, shells not more than 1.80 m in diameter shall be not less than 3 mm thick in the reference steel or of equivalent thickness in the metal to be used. Shells more than 1.80 m in diameter shall be not less than 4 mm thick in the reference steel or of equivalent thickness in the metal to be used.
- 6.7.2.4.4** The cylindrical portions, ends (heads) and manhole covers of all shells shall be not less than 3 mm thick regardless of the material of construction.
- 6.7.2.4.5** The additional protection referred to in 6.7.2.4.3 may be provided by overall external structural protection, such as suitable "sandwich" construction with the outer sheathing (jacket) secured to the shell, double wall construction or by enclosing the shell in a complete framework with longitudinal and transverse structural members.
- 6.7.2.4.6** The equivalent thickness of a metal other than the thickness prescribed for the reference steel in 6.7.2.4.2 shall be determined using the following formula:
- $$e_1 = \frac{21.4 e_0}{\sqrt[3]{R_{m1} A_1}}$$
- where:
- $e_1$  = required equivalent thickness (in mm) of the metal to be used;
  - $e_0$  = minimum thickness (in mm) of the reference steel specified in the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column (11) of Table A of Chapter 3.2 and described in 4.2.5.3;
  - $R_{m1}$  = guaranteed minimum tensile strength (in N/mm<sup>2</sup>) of the metal to be used (see 6.7.2.3.3);
  - $A_1$  = guaranteed minimum elongation at fracture (in %) of the metal to be used according to national or international standards.
- 6.7.2.4.7** When in the applicable portable tank instruction in 4.2.5.2.6, a minimum thickness of 8 mm or 10 mm is specified, it shall be noted that these thicknesses are based on the properties of the reference steel and a shell diameter of 1.80 m. When a metal other than mild steel (see 6.7.2.1) is used or the shell has a diameter of more than 1.80 m, the thickness shall be determined using the following formula:
- $$e_1 = \frac{21.4 e_0 d_1}{1.8 \sqrt[3]{R_{m1} A_1}}$$
- where:
- $e_1$  = required equivalent thickness (in mm) of the metal to be used;
  - $e_0$  = minimum thickness (in mm) of the reference steel specified in the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column (11) of Table A of Chapter 3.2 and described in 4.2.5.3;
  - $d_1$  = diameter of the shell (in m), but not less than 1.80 m;
  - $R_{m1}$  = guaranteed minimum tensile strength (in N/mm<sup>2</sup>) of the metal to be used (see 6.7.2.3.3);
  - $A_1$  = guaranteed minimum elongation at fracture (in %) of the metal to be used according to national or international standards.
- 6.7.2.4.8** In no case shall the wall thickness be less than that prescribed in 6.7.2.4.2, 6.7.2.4.3 and 6.7.2.4.4. All parts of the shell shall have a minimum thickness as determined by 6.7.2.4.2 to 6.7.2.4.4. This thickness shall be exclusive of any corrosion allowance.
- 6.7.2.4.9** When mild steel is used (see 6.7.2.1), calculation using the formula in 6.7.2.4.6 is not required.
- 6.7.2.4.10** There shall be no sudden change of plate thickness at the attachment of the ends (heads) to the cylindrical portion of the shell.

**6.7.2.5 Service equipment**

- 6.7.2.5.1** Service equipment shall be so arranged as to be protected against the risk of being wrenched off or damaged during handling and carriage. When the connection between the frame and the shell allows relative movement between the sub-assemblies, the equipment shall be so fastened as to permit such movement without risk of damage to working parts. The external discharge fittings (pipe sockets, shut-off devices), the internal stop-valve and its seating shall be protected against the danger of being wrenched off by external forces (for example using shear sections). The filling and discharge devices (including flanges or threaded plugs) and any protective caps shall be capable of being secured against unintended opening.
- 6.7.2.5.2** All openings in the shell, intended for filling or discharging the portable tank shall be fitted with a manually operated stop-valve located as close to the shell as reasonably practicable. Other openings, except for openings leading to venting or pressure-relief devices, shall be equipped with either a stop-valve or another suitable means of closure located as close to the shell as reasonably practicable.
- 6.7.2.5.3** All portable tanks shall be fitted with a manhole or other inspection openings of a suitable size to allow for internal inspection and adequate access for maintenance and repair of the interior. Compartmented portable tanks shall have a manhole or other inspection openings for each compartment.
- 6.7.2.5.4** As far as reasonably practicable, external fittings shall be grouped together. For insulated portable tanks, top fittings shall be surrounded by a spill collection reservoir with suitable drains.
- 6.7.2.5.5** Each connection to a portable tank shall be clearly marked to indicate its function.
- 6.7.2.5.6** Each stop-valve or other means of closure shall be designed and constructed to a rated pressure not less than the MAWP of the shell taking into account the temperatures expected during carriage. All stop-valves with screwed spindles shall close by a clockwise motion of the handwheel. For other stop-valves the position (open and closed) and direction of closure shall be clearly indicated. All stop-valves shall be designed to prevent unintentional opening.
- 6.7.2.5.7** No moving parts, such as covers, components of closures, etc., shall be made of unprotected corrodible steel when they are liable to come into frictional or percussive contact with aluminium portable tanks intended for the carriage of substances meeting the flash-point criteria of Class 3 including elevated temperature substances carried at or above their flash-point.
- 6.7.2.5.8** Piping shall be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration. All piping shall be of a suitable metallic material. Welded pipe joints shall be used wherever possible.
- 6.7.2.5.9** Joints in copper tubing shall be brazed or have an equally strong metal union. The melting point of brazing materials shall be no lower than 525 °C. The joints shall not decrease the strength of the tubing as may happen when cutting threads.
- 6.7.2.5.10** The burst pressure of all piping and pipe fittings shall be not less than the highest of four times the MAWP of the shell or four times the pressure to which it may be subjected in service by the action of a pump or other device (except pressure-relief devices).
- 6.7.2.5.11** Ductile metals shall be used in the construction of valves and accessories.

**6.7.2.6 Bottom openings**

- 6.7.2.6.1** Certain substances shall not be carried in portable tanks with bottom openings. When the applicable portable tank instruction identified in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 indicates that bottom openings are prohibited there shall be no openings below the liquid level of the shell when it is filled to its maximum permissible filling limit. When an existing opening is closed it shall be accomplished by internally and externally welding one plate to the shell.
- 6.7.2.6.2** Bottom discharge outlets for portable tanks carrying certain solid, crystallizable or highly viscous substances shall be equipped with not less than two serially fitted and mutually independent shut-off devices. The design of the equipment shall be to the satisfaction of the competent authority or its authorized body and shall include:
- (a) An external stop-valve fitted as close to the shell as reasonably practicable; and
  - (b) A liquid tight closure at the end of the discharge pipe, which may be a bolted blank flange or a screw cap.
- 6.7.2.6.3** Every bottom discharge outlet, except as provided in 6.7.2.6.2, shall be equipped with three serially fitted and mutually independent shut-off devices. The design of the equipment shall be to the satisfaction of the competent authority or its authorized body and include:
- (a) A self-closing internal stop-valve, that is a stop-valve within the shell or within a welded flange or its companion flange, such that:

- (i) The control devices for the operation of the valve are designed so as to prevent any unintended opening through impact or other inadvertent act;
  - (ii) The valve may be operable from above or below;
  - (iii) If possible, the setting of the valve (open or closed) shall be capable of being verified from the ground;
  - (iv) Except for portable tanks having a capacity of not more than 1 000 litres, it shall be possible to close the valve from an accessible position of the portable tank that is remote from the valve itself; and
  - (v) The valve shall continue to be effective in the event of damage to the external device for controlling the operation of the valve;
- (b) An external stop-valve fitted as close to the shell as reasonably practicable; and
- (c) A liquid tight closure at the end of the discharge pipe, which may be a bolted blank flange or a screw cap.

**6.7.2.6.4** For a lined shell, the internal stop-valve required by 6.7.2.6.3 (a) may be replaced by an additional external stop-valve. The manufacturer shall satisfy the requirements of the competent authority or its authorized body.

**6.7.2.7 Safety-relief devices**

**6.7.2.7.1** All portable tanks shall be fitted with at least one pressure-relief device. All relief devices shall be designed, constructed and marked to the satisfaction of the competent authority or its authorized body.

**6.7.2.8 Pressure-relief devices**

**6.7.2.8.1** Every portable tank with a capacity not less than 1 900 litres and every independent compartment of a portable tank with a similar capacity, shall be provided with one or more pressure-relief devices of the spring-loaded type and may in addition have a frangible disc or fusible element in parallel with the spring-loaded devices except when prohibited by reference to 6.7.2.8.3 in the applicable portable tank instruction in 4.2.5.2.6. The pressure-relief devices shall have sufficient capacity to prevent rupture of the shell due to over pressurization or vacuum resulting from filling, discharging, or from heating of the contents.

**6.7.2.8.2** Pressure-relief devices shall be designed to prevent the entry of foreign matter, the leakage of liquid and the development of any dangerous excess pressure.

**6.7.2.8.3** When required for certain substances by the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6, portable tanks shall have a pressure-relief device approved by the competent authority. Unless a portable tank in dedicated service is fitted with an approved relief device constructed of materials compatible with the substance carried, the relief device shall comprise a frangible disc preceding a spring-loaded pressure-relief device. When a frangible disc is inserted in series with the required pressure-relief device, the space between the frangible disc and the pressure-relief device shall be provided with a pressure gauge or suitable tell-tale indicator for the detection of disc rupture, pinholing, or leakage which could cause a malfunction of the pressure-relief system. The frangible disc shall rupture at a nominal pressure 10% above the start to discharge pressure of the relief device.

**6.7.2.8.4** Every portable tank with a capacity less than 1 900 litres shall be fitted with a pressure-relief device which may be a frangible disc when this disc complies with the requirements of 6.7.2.11.1. When no spring-loaded pressure-relief device is used, the frangible disc shall be set to rupture at a nominal pressure equal to the test pressure.

**6.7.2.8.5** When the shell is fitted for pressure discharge, the inlet line shall be provided with a suitable pressure-relief device set to operate at a pressure not higher than the MAWP of the shell, and a stop-valve shall be fitted as close to the shell as reasonably practicable.

**6.7.2.9 Setting of pressure-relief devices**

**6.7.2.9.1** It shall be noted that the pressure-relief devices shall operate only in conditions of excessive rise in temperature, since the shell shall not be subject to undue fluctuations of pressure during normal conditions of carriage (see 6.7.2.12.2).

**6.7.2.9.2** The required pressure-relief device shall be set to start-to-discharge at a nominal pressure of five-sixths of the test pressure for shells having a test pressure of not more than 4.5 bar and 110% of two-thirds of the test pressure for shells having a test pressure of more than 4.5 bar. After discharge the device shall close at a pressure not more than 10% below the pressure at which the discharge starts. The device shall remain closed at all lower pressures. This requirement does not prevent the use of vacuum-relief or combination pressure-relief and vacuum-relief devices.

**6.7.2.10 Fusible elements**

**6.7.2.10.1** Fusible elements shall operate at a temperature between 110 °C and 149 °C on condition that the pressure in the shell at the fusing temperature will be not more than the test pressure. They shall be placed at the top of the shell with their inlets in the vapour space and in no case shall they be shielded from external heat. Fusible elements shall not be utilized on portable tanks with a test pressure which exceeds 2.65 bar. Fusible elements used on portable tanks intended for the carriage of elevated temperature substances shall be designed to operate at a temperature higher than the maximum temperature that will be experienced during carriage and shall be to the satisfaction of the competent authority or its authorized body.

**6.7.2.11 Frangible discs**

**6.7.2.11.1** Except as specified in 6.7.2.8.3, frangible discs shall be set to rupture at a nominal pressure equal to the test pressure throughout the design temperature range. Particular attention shall be given to the requirements of 6.7.2.5.1 and 6.7.2.8.3 if frangible discs are used.

**6.7.2.11.2** Frangible discs shall be appropriate for the vacuum pressures which may be produced in the portable tank.

**6.7.2.12 Capacity of pressure-relief devices**

**6.7.2.12.1** The spring-loaded pressure-relief device required by 6.7.2.8.1 shall have a minimum cross sectional flow area equivalent to an orifice of 31.75 mm diameter. Vacuum-relief devices, when used, shall have a cross sectional flow area not less than 284 mm<sup>2</sup>.

**6.7.2.12.2** The combined delivery capacity of the pressure relief system (taking into account the reduction of the flow when the portable tank is fitted with frangible-discs preceding spring-loaded pressure-relief devices or when the spring-loaded pressure-relief devices are provided with a device to prevent the passage of the flame), in condition of complete fire engulfment of the portable tank shall be sufficient to limit the pressure in the shell to 20% above the start-to-discharge pressure of the pressure limiting device. Emergency pressure-relief devices may be used to achieve the full relief capacity prescribed. These devices may be fusible, spring loaded or frangible disc components, or a combination of spring-loaded and frangible disc devices. The total required capacity of the relief devices may be determined using the formula in 6.7.2.12.2.1 or the table in 6.7.2.12.2.3.

**6.7.2.12.2.1** To determine the total required capacity of the relief devices, which shall be regarded as being the sum of the individual capacities of all the contributing devices, the following formula shall be used:

$$Q = 12.4 \frac{FA^{0.82}}{LC} \sqrt{\frac{ZT}{M}}$$

where:

**Q** = minimum required rate of discharge in cubic metres of air per second (m<sup>3</sup>/s) at standard conditions: 1 bar and 0 °C (273 K);

**F** = is a coefficient with the following value:

for uninsulated shells:  $F = 1$ ;

for insulated shells:  $F = U(649 - t)/13.6$  but in no case is less than 0.25

where:

**U** = thermal conductance of the insulation, in kW·m<sup>-2</sup>·K<sup>-1</sup>, at 38 °C;

**t** = actual temperature of the substance during filling (in °C);

when this temperature is unknown, let  $t = 15$  °C;

The value of **F** given above for insulated shells may be taken provided that the insulation is in accordance with 6.7.2.12.2.4;

**A** = total external surface area of shell in m<sup>2</sup>;

**Z** = the gas compressibility factor in the accumulating condition (when this factor is unknown, let  $Z = 1.0$ );

**T** = absolute temperature in Kelvin (°C + 273) above the pressure-relief devices in the accumulating condition;

**L** = the latent heat of vaporization of the liquid, in kJ/kg, in the accumulating condition;

**M** = molecular mass of the discharged gas;

**C** = a constant which is derived from one of the following formulae as a function of the ratio **k** of specific heats:

$$k = \frac{c_p}{c_v}$$

where:

$c_p$  is the specific heat at constant pressure; and

$c_v$  is the specific heat at constant volume.

When  $k > 1$ :

$$C = \sqrt{k \left( \frac{2}{k+1} \right)^{\frac{k+1}{k-1}}}$$

When  $k = 1$  or  $k$  is unknown:

$$C = \frac{1}{\sqrt{e}} = 0.607$$

where  $e$  is the mathematical constant 2.7183.

$C$  may also be taken from the following table:

k	C	k	C	k	C
1.00	0.607	1.26	0.660	1.52	0.704
1.02	0.611	1.28	0.664	1.54	0.707
1.04	0.615	1.30	0.667	1.56	0.710
1.06	0.620	1.32	0.671	1.58	0.713
1.08	0.624	1.34	0.674	1.60	0.716
1.10	0.628	1.36	0.678	1.62	0.719
1.12	0.633	1.38	0.681	1.64	0.722
1.14	0.637	1.40	0.685	1.66	0.725
1.16	0.641	1.42	0.688	1.68	0.728
1.18	0.645	1.44	0.691	1.70	0.731
1.20	0.649	1.46	0.695	2.00	0.770
1.22	0.652	1.48	0.698	2.20	0.793
1.24	0.656	1.50	0.701		

**6.7.2.12.2.2** As an alternative to the formula above, shells designed for the carriage of liquids may have their relief devices sized in accordance with the table in 6.7.2.12.2.3. This table assumes an insulation value of  $F = 1$  and shall be adjusted accordingly when the shell is insulated. Other values used in determining this table are:

$$\begin{aligned} M &= 86.7 & T &= 394 \text{ K} \\ L &= 334.94 \text{ kJ/kg} & C &= 0.607 \\ Z &= 1 \end{aligned}$$

**6.7.2.12.2.3** Minimum required rate of discharge,  $Q$ , in cubic metres per air per second at 1 bar and 0 °C (273 K)

A Exposed area (square metres)	Q (Cubic metres of air per second)	A Exposed area (square metres)	Q (Cubic metres of air per second)
2	0.230	37.5	2.539
3	0.320	40	2.677
4	0.405	42.5	2.814
5	0.487	45	2.949
6	0.565	47.5	3.082
7	0.641	50	3.215
8	0.715	52.5	3.346
9	0.788	55	3.476
10	0.859	57.5	3.605
12	0.998	60	3.733
14	1.132	62.5	3.860
16	1.263	65	3.987
18	1.391	67.5	4.112
20	1.517	70	4.236
22.5	1.670	75	4.483
25	1.821	80	4.726
27.5	1.969	85	4.967
30	2.115	90	5.206
32.5	2.258	95	5.442
35	2.400	100	5.676

**6.7.2.12.2.4** Insulation systems, used for the purpose of reducing venting capacity, shall be approved by the competent authority or its authorized body. In all cases, insulation systems approved for this purpose shall:

- (a) Remain effective at all temperatures up to 649 °C; and
- (b) Be jacketed with a material having a melting point of 700 °C or greater.

**6.7.2.13 Marking of pressure-relief devices**

**6.7.2.13.1** Every pressure-relief device shall be clearly and permanently marked with the following particulars:

- (a) The pressure (in bar or kPa) or temperature (in °C) at which it is set to discharge;
- (b) The allowable tolerance at the discharge pressure for spring-loaded devices;
- (c) The reference temperature corresponding to the rated pressure for frangible discs;
- (d) The allowable temperature tolerance for fusible elements; and
- (e) The rated flow capacity of the spring-loaded pressure relief devices, frangible discs or fusible elements in standard cubic metres of air per second (m<sup>3</sup>/s);

When practicable, the following information shall also be shown:

- (f) The manufacturer's name and relevant catalogue number of the device.

**6.7.2.13.2** The rated flow capacity marked on the spring-loaded pressure-relief devices shall be determined according to ISO 4126-1:1991.

**6.7.2.14 Connections to pressure-relief devices**

**6.7.2.14.1** Connections to pressure-relief devices shall be of sufficient size to enable the required discharge to pass unrestricted to the safety device. No stop-valve shall be installed between the shell and the pressure-relief devices except where duplicate devices are provided for maintenance or other reasons and the stop-valves serving the devices actually in use are locked open or the stop-valves are interlocked so that at least one of the duplicate devices is always in use. There shall be no obstruction in an opening leading to a vent or pressure-relief device which might restrict or cut-off the flow from the shell to that device. Vents or pipes from the pressure-relief device outlets, when used, shall deliver the relieved vapour or liquid to the atmosphere in conditions of minimum back-pressure on the relieving devices.

**6.7.2.15 Siting of pressure-relief devices**

**6.7.2.15.1** Each pressure-relief device inlet shall be situated on top of the shell in a position as near the longitudinal and transverse centre of the shell as reasonably practicable. All pressure-relief device inlets shall under maximum filling conditions be situated in the vapour space of the shell and the devices shall be so arranged as to ensure the escaping vapour is discharged unrestrictedly. For flammable substances, the escaping vapour shall be directed away from the shell in such a manner that it cannot impinge upon the shell. Protective devices which deflect the flow of vapour are permissible provided the required relief-device capacity is not reduced.

**6.7.2.15.2** Arrangements shall be made to prevent access to the pressure-relief devices by unauthorized persons and to protect the devices from damage caused by the portable tank overturning.

**6.7.2.16 Gauging devices**

**6.7.2.16.1** Glass level-gauges and gauges made of other fragile material, which are in direct communication with the contents of the tank shall not be used.

**6.7.2.17 Portable tank supports, frameworks, lifting and tie-down attachments**

**6.7.2.17.1** Portable tanks shall be designed and constructed with a support structure to provide a secure base during carriage. The forces specified in 6.7.2.2.12 and the safety factor specified in 6.7.2.2.13 shall be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.

**6.7.2.17.2** The combined stresses caused by portable tank mountings (e.g. cradles, framework, etc.) and portable tank lifting and tie-down attachments shall not cause excessive stress in any portion of the shell. Permanent lifting and tie-down attachments shall be fitted to all portable tanks. Preferably they shall be fitted to the portable tank supports but may be secured to reinforcing plates located on the shell at the points of support.

**6.7.2.17.3** In the design of supports and frameworks the effects of environmental corrosion shall be taken into account.

**6.7.2.17.4** Forklift pockets shall be capable of being closed off. The means of closing forklift pockets shall be a permanent part of the framework or permanently attached to the framework. Single compartment portable tanks with a length less than 3.65 m need not have closed off forklift pockets provided that:

- (a) The shell including all the fittings are well protected from being hit by the forklift blades; and

- (b) The distance between the centres of the forklift pockets is at least half of the maximum length of the portable tank.

**6.7.2.17.5** When portable tanks are not protected during carriage, according to 4.2.1.2, the shells and service equipment shall be protected against damage to the shell and service equipment resulting from lateral or longitudinal impact or overturning. External fittings shall be protected so as to preclude the release of the shell contents upon impact or overturning of the portable tank on its fittings. Examples of protection include:

- (a) Protection against lateral impact which may consist of longitudinal bars protecting the shell on both sides at the level of the median line;
- (b) Protection of the portable tank against overturning which may consist of reinforcement rings or bars fixed across the frame;
- (c) Protection against rear impact which may consist of a bumper or frame;
- (d) Protection of the shell against damage from impact or overturning by use of an ISO frame in accordance with ISO 1496-3:1995.

**6.7.2.18 Design approval**

**6.7.2.18.1** The competent authority or its authorized body shall issue a design approval certificate for any new design of a portable tank. This certificate shall attest that a portable tank has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this Chapter and where appropriate, the provisions for substances provided in Chapter 4.2 and in Table A of Chapter 3.2. When a series of portable tanks are manufactured without change in the design, the certificate shall be valid for the entire series. The certificate shall refer to the prototype test report, the substances or group of substances allowed to be carried, the materials of construction of the shell and lining (when applicable) and an approval number. The approval number shall consist of the distinguishing sign or mark of the State in whose territory the approval was granted, i.e. the distinguishing sign for use in international traffic as prescribed by the Convention on Road Traffic, Vienna 1968, and a registration number. Any alternative arrangements according to 6.7.1.2 shall be indicated on the certificate. A design approval may serve for the approval of smaller portable tanks made of materials of the same kind and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.

**6.7.2.18.2** The prototype test report for the design approval shall include at least the following:

- (a) The results of the applicable framework test specified in ISO 1496-3:1995;
- (b) The results of the initial inspection and test according to 6.7.2.19.3; and
- (c) The results of the impact test in 6.7.2.19.1, when applicable.

**6.7.2.19 Inspection and testing**

**6.7.2.19.1** Portable tanks meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended, shall not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual of Tests and Criteria, Part IV, Section 41.

**6.7.2.19.2** The shell and items of equipment of each portable tank shall be inspected and tested before being put into service for the first time (initial inspection and test) and thereafter at not more than five-year intervals (5 year periodic inspection and test) with an intermediate periodic inspection and test (2.5 year periodic inspection and test) midway between the 5 year periodic inspections and tests. The 2.5 year inspection and test may be performed within 3 months of the specified date. An exceptional inspection and test shall be performed regardless of the date of the last periodic inspection and test when necessary according to 6.7.2.19.7.

**6.7.2.19.3** The initial inspection and test of a portable tank shall include a check of the design characteristics, an internal and external examination of the portable tank and its fittings with due regard to the substances to be carried, and a pressure test. Before the portable tank is placed into service, a leakproofness test and a check of the satisfactory operation of all service equipment shall also be performed. When the shell and its fittings have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.

**6.7.2.19.4** The 5-year periodic inspection and test shall include an internal and external examination and, as a general rule, a hydraulic pressure test. Sheathing, thermal insulation and the like shall be removed only to the extent required for reliable appraisal of the condition of the portable tank. When the shell and equipment have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.

**6.7.2.19.5** The intermediate 2.5 year periodic inspection and test shall at least include an internal and external examination of the portable tank and its fittings with due regard to the substances intended to be carried, a leakproofness test and a check of the satisfactory operation of all service equipment. Sheathing, thermal insulation and the like shall be removed only to the extent required for reliable appraisal of the condition of the portable tank. For portable tanks intended for the carriage of a single substance, the 2.5 year internal ex-

amination may be waived or substituted by other test methods or inspection procedures specified by the competent authority or its authorized body.

**6.7.2.19.6** A portable tank may not be filled and offered for carriage after the date of expiry of the last 5 year or 2.5 year periodic inspection and test as required by 6.7.2.19.2. However, a portable tank filled prior to the date of expiry of the last periodic inspection and test may be carried for a period not to exceed three months beyond the date of expiry of the last periodic test or inspection. In addition, a portable tank may be carried after the date of expiry of the last periodic test and inspection:

- (a) After emptying but before cleaning, for purposes of performing the next required test or inspection prior to refilling; and
- (b) Unless otherwise approved by the competent authority, for a period not to exceed six months beyond the date of expiry of the last periodic test or inspection, in order to allow the return of dangerous goods for proper disposal or recycling. Reference to this exemption shall be mentioned in the transport document.

**6.7.2.19.7** The exceptional inspection and test is necessary when the portable tank shows evidence of damaged or corroded areas, or leakage, or other conditions that indicate a deficiency that could affect the integrity of the portable tank. The extent of the exceptional inspection and test shall depend on the amount of damage or deterioration of the portable tank. It shall include at least the 2.5 year inspection and test according to 6.7.2.19.5.

**6.7.2.19.8** The internal and external examinations shall ensure that:

- (a) The shell is inspected for pitting, corrosion, or abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the portable tank unsafe for carriage;
- (b) The piping, valves, heating/cooling system, and gaskets are inspected for corroded areas, defects, or any other conditions, including leakage, that might render the portable tank unsafe for filling, discharge or carriage;
- (c) Devices for tightening manhole covers are operative and there is no leakage at manhole covers or gaskets;
- (d) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
- (e) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves shall be operated to demonstrate proper operation;
- (f) Linings, if any, are inspected in accordance with criteria outlined by the lining manufacturer;
- (g) Required markings on the portable tank are legible and in accordance with the applicable requirements; and
- (h) The framework, supports and arrangements for lifting the portable tank are in a satisfactory condition.

**6.7.2.19.9** The inspections and tests in 6.7.2.19.1, 6.7.2.19.3, 6.7.2.19.4, 6.7.2.19.5 and 6.7.2.19.7 shall be performed or witnessed by an expert approved by the competent authority or its authorized body. When the pressure test is a part of the inspection and test, the test pressure shall be the one indicated on the data plate of the portable tank. While under pressure, the portable tank shall be inspected for any leaks in the shell, piping or equipment.

**6.7.2.19.10** In all cases when cutting, burning or welding operations on the shell have been effected, that work shall be to the approval of the competent authority or its authorized body taking into account the pressure vessel code used for the construction of the shell. A pressure test to the original test pressure shall be performed after the work is completed.

**6.7.2.19.11** When evidence of any unsafe condition is discovered, the portable tank shall not be returned to service until it has been corrected and the test is repeated and passed.

## **6.7.2.20 Marking**

**6.7.2.20.1** Every portable tank shall be fitted with a corrosion resistant metal plate permanently attached to the portable tank in a conspicuous place readily accessible for inspection. When for reasons of portable tank arrangements the plate cannot be permanently attached to the shell, the shell shall be marked with at least the information required by the pressure vessel code. As a minimum at least the following information shall be marked on the plate by stamping or by any other similar method.

Country of manufacture

U	Approval	Approval	For Alternative Arrangements (see 6.7.1.2)
N	country	number	"AA"

Manufacturer's name or mark

Manufacturer's serial number

**6.7.2.20.2** The following particulars shall be marked either on the portable tank itself or on a metal plate firmly secured to the portable tank:

Name of the operator

Maximum permissible gross mass (MPGM) \_\_\_\_\_ kg

Unladen (tare) mass \_\_\_\_\_ kg

**NOTE:** For the identification of the substances being carried, see also Part 5.

**6.7.2.20.3** If a portable tank is designed and approved for handling in open seas, the words "OFFSHORE PORTABLE TANK" shall be marked on the identification plate.

---

<sup>2</sup> The unit used shall be marked.

<sup>3</sup> See 6.7.2.2.10.

### 6.7.3 Requirements for the design, construction, inspection and testing of portable tanks intended for the carriage of non-refrigerated liquefied gases

#### 6.7.3.1 Definitions

For the purposes of this section:

*Alternative arrangement* means an approval granted by the competent authority for a portable tank or MEGC that has been designed, constructed or tested to technical requirements or testing methods other than those specified in this Chapter;

*Design pressure* means the pressure to be used in calculations required by a recognized pressure vessel code. The design pressure shall be not less than the highest of the following pressures:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The sum of:
  - (i) the maximum effective gauge pressure to which the shell is designed as defined in (b) of the MAWP definition (see above); and
  - (ii) a head pressure determined on the basis of the static forces specified in 6.7.3.2.9, but not less than 0.35 bar;

*Design reference temperature* means the temperature at which the vapour pressure of the contents is determined for the purpose of calculating the MAWP. The design reference temperature shall be less than the critical temperature of the non-refrigerated liquefied gas intended to be carried to ensure that the gas at all times is liquefied. This value for each portable tank type is as follows:

- (a) Shell with a diameter of 1.5 metres or less: 65 °C;
- (b) Shell with a diameter of more than 1.5 metres:
  - (i) without insulation or sun shield: 60 °C;
  - (ii) with sun shield (see 6.7.3.2.12): 55 °C; and
  - (iii) with insulation (see 6.7.3.2.12) : 50 °C;

*Design temperature range* for the shell shall be –40 °C to 50 °C for non-refrigerated liquefied gases carried under ambient conditions. More severe design temperatures shall be considered for portable tanks subjected to severe climatic conditions;

*Filling density* means the average mass of non-refrigerated liquefied gas per litre of shell capacity (kg/l). The filling density is given in portable tank instruction T50 in 4.2.5.2.6;

*Leakproofness test* means a test using gas subjecting the shell and its service equipment to an effective internal pressure of not less than 25% of the MAWP;

*Maximum allowable working pressure (MAWP)* means a pressure that shall be not less than the highest of the following pressures measured at the top of the shell while in operating position, but in no case less than 7 bar:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The maximum effective gauge pressure to which the shell is designed, which shall be:
  - (i) for a non-refrigerated liquefied gas listed in the portable tank instruction T50 in 4.2.5.2.6, the MAWP (in bar) given in T50 portable tank instruction for that gas;
  - (ii) for other non-refrigerated liquefied gases, not less than the sum of:
    - the absolute vapour pressure (in bar) of the non-refrigerated liquefied gas at the design reference temperature minus 1 bar; and
    - the partial pressure (in bar) of air or other gases in the ullage space being determined by the design reference temperature and the liquid phase expansion due to an increase of the mean bulk temperature of  $t_r$  -  $t_l$  ( $t_l$  = filling temperature, usually 15 °C,  $t_r$  = maximum mean bulk temperature, 50 °C);

*Maximum permissible gross mass (MPGM)* means the sum of the tare mass of the portable tank and the heaviest load authorized for carriage;

*Mild steel* means a steel with a guaranteed minimum tensile strength of 360 N/mm<sup>2</sup> to 440 N/mm<sup>2</sup> and a guaranteed minimum elongation at fracture conforming to 6.7.3.3.3.3;

*Portable tank* means a multimodal tank having a capacity of more than 450 litres used for the carriage of non-refrigerated liquefied gases of Class 2. The portable tank includes a shell fitted with service equipment and structural equipment necessary for the carriage of gases. The portable tank shall be capable of being filled and discharged without the removal of its structural equipment. It shall possess stabilizing members external to the shell, and shall be capable of being lifted when full. It shall be designed primarily to be

loaded onto a vehicle, wagon or sea-going or inland navigation vessel and shall be equipped with skids, mountings or accessories to facilitate mechanical handling. Tank-vehicles, tank-wagons, non-metallic tanks, intermediate bulk containers (IBCs), gas cylinders and large receptacles are not considered to fall within the definition for portable tanks;

*Reference steel* means a steel with a tensile strength of 370 N/mm<sup>2</sup> and an elongation at fracture of 27%;

*Service equipment* means measuring instruments and filling, discharge, venting, safety and insulating devices;

*Shell* means the part of the portable tank which retains the non-refrigerated liquefied gas intended for carriage (tank proper), including openings and their closures, but does not include service equipment or external structural equipment;

*Structural equipment* means the reinforcing, fastening, protective and stabilizing members external to the shell;

*Test pressure* means the maximum gauge pressure at the top of the shell during the pressure test.

#### 6.7.3.2 General design and construction requirements

**6.7.3.2.1** Shells shall be designed and constructed in accordance with the requirements of a pressure vessel code recognized by the competent authority. Shells shall be made of steel suitable for forming. The materials shall in principle conform to national or international material standards. For welded shells, only a material whose weldability has been fully demonstrated shall be used. Welds shall be skilfully made and afford complete safety. When the manufacturing process or the materials make it necessary, the shells shall be suitably heat-treated to guarantee adequate toughness in the weld and in the heat affected zones. In choosing the material the design temperature range shall be taken into account with respect to risk of brittle fracture, to stress corrosion cracking and to resistance to impact. When fine grain steel is used, the guaranteed value of the yield strength shall be not more than 460 N/mm<sup>2</sup> and the guaranteed value of the upper limit of the tensile strength shall be not more than 725 N/mm<sup>2</sup> according to the material specification. Portable tank materials shall be suitable for the external environment in which they may be carried.

**6.7.3.2.2** Portable tank shells, fittings and pipework shall be constructed of materials which are:

- (a) Substantially immune to attack by the non-refrigerated liquefied gas(es) intended to be carried; or
- (b) Properly passivated or neutralized by chemical reaction.

**6.7.3.2.3** Gaskets shall be made of materials compatible with the non-refrigerated liquefied gas(es) intended to be carried.

**6.7.3.2.4** Contact between dissimilar metals which could result in damage by galvanic action shall be avoided.

**6.7.3.2.5** The materials of the portable tank, including any devices, gaskets, and accessories, shall not adversely affect the non-refrigerated liquefied gas(es) intended for carriage in the portable tank.

**6.7.3.2.6** Portable tanks shall be designed and constructed with supports to provide a secure base during carriage and with suitable lifting and tie-down attachments.

**6.7.3.2.7** Portable tanks shall be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and carriage. The design shall demonstrate that the effects of fatigue, caused by repeated application of these loads through the expected life of the portable tank, have been taken into account.

**6.7.3.2.8** Shells shall be designed to withstand an external pressure of at least 0.4 bar (gauge pressure) above the internal pressure without permanent deformation. When the shell is to be subjected to a significant vacuum before filling or during discharge it shall be designed to withstand an external pressure of at least 0.9 bar (gauge pressure) above the internal pressure and shall be proven at that pressure.

**6.7.3.2.9** Portable tanks and their fastenings shall, under the maximum permissible load, be capable of absorbing the following separately applied static forces:

- (a) In the direction of travel: twice the MPGM multiplied by the acceleration due to gravity ( $g$ )<sup>4</sup>;
- (b) Horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces shall be equal to twice the MPGM) multiplied by the acceleration due to gravity ( $g$ )<sup>4</sup>;
- (c) Vertically upwards: the MPGM multiplied by the acceleration due to gravity ( $g$ )<sup>4</sup>; and

---

<sup>4</sup> For calculation purposes  $g = 9.81 \text{ m/s}^2$ .

(d) Vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity ( $g$ )<sup>4</sup>.

**6.7.3.2.10** Under each of the forces in 6.7.3.2.9, the safety factor to be observed shall be as follows:

- (a) For steels having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; or
- (b) For steels with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength and, for austenitic steels, the 1% proof strength.

**6.7.3.2.11** The values of yield strength or proof strength shall be the values according to national or international material standards. When austenitic steels are used, the specified minimum values of yield strength and proof strength according to the material standards may be increased by up to 15% when these greater values are attested in the material inspection certificate. When no material standard exists for the steel in question, the value of yield strength or proof strength used shall be approved by the competent authority.

**6.7.3.2.12** When the shells intended for the carriage of non-refrigerated liquefied gases are equipped with thermal insulation, the thermal insulation systems shall satisfy the following requirements:

- (a) It shall consist of a shield covering not less than the upper third but not more than the upper half of the surface of the shell and separated from the shell by an air space about 40 mm across;
- (b) It shall consist of a complete cladding of adequate thickness of insulating materials protected so as to prevent the ingress of moisture and damage under normal conditions of carriage and so as to provide a thermal conductance of not more than  $0.67 \text{ (W}\cdot\text{m}^{-2}\cdot\text{K}^{-1}\text{)}$ ;
- (c) When the protective covering is so closed as to be gas-tight, a device shall be provided to prevent any dangerous pressure from developing in the insulating layer in the event of inadequate gas tightness of the shell or of its items of equipment; and
- (d) The thermal insulation shall not inhibit access to the fittings and discharge devices.

**6.7.3.2.13** Portable tanks intended for the carriage of flammable non-refrigerated liquefied gases shall be capable of being electrically earthed.

#### **6.7.3.3 Design criteria**

**6.7.3.3.1** Shells shall be of a circular cross-section.

**6.7.3.3.2** Shells shall be designed and constructed to withstand a test pressure not less than 1.3 times the design pressure. The shell design shall take into account the minimum MAWP values provided in portable tank instruction T50 in 4.2.5.2.6 for each non-refrigerated liquefied gas intended for carriage. Attention is drawn to the minimum shell thickness requirements for these shells specified in 6.7.3.4.

**6.7.3.3.3** For steels exhibiting a clearly defined yield point or characterized by a guaranteed proof strength (0.2% proof strength, generally, or 1% proof strength for austenitic steels) the primary membrane stress  $\sigma$  (sigma) in the shell shall not exceed  $0.75 R_e$  or  $0.50 R_m$ , whichever is lower, at the test pressure, where:  
 $R_e$  = yield strength in  $\text{N/mm}^2$ , or 0.2% proof strength or, for austenitic steels, 1% proof stress;  
 $R_m$  = minimum tensile strength in  $\text{N/mm}^2$ .

**6.7.3.3.3.1** The values of  $R_e$  and  $R_m$  to be used shall be the specified minimum values according to national or international material standards. When austenitic steels are used, the specified minimum values for  $R_e$  and  $R_m$  according to the material standards may be increased by up to 15% when these greater values are attested in the material inspection certificate. When no material standard exists for the steel in question, the values of  $R_e$  and  $R_m$  used shall be approved by the competent authority or its authorized body.

**6.7.3.3.3.2** Steels which have a  $R_e/R_m$  ratio of more than 0.85 are not allowed for the construction of welded shells. The values of  $R_e$  and  $R_m$  to be used in determining this ratio shall be the values specified in the material inspection certificate.

**6.7.3.3.3.3** Steels used in the construction of shells shall have an elongation at fracture, in %, of not less than  $10\,000/R_m$  with an absolute minimum of 16% for fine grain steels and 20% for other steels.

**6.7.3.3.3.4** For the purpose of determining actual values for materials, it shall be noted that for sheet metal, the axis of the tensile test specimen shall be at right angles (transversely) to the direction of rolling. The permanent elongation at fracture shall be measured on test specimens of rectangular cross sections in accordance with ISO 6892:1998 using a 50 mm gauge length.

#### **6.7.3.4 Minimum shell thickness**

**6.7.3.4.1** The minimum shell thickness shall be the greater thickness based on:

- (a) The minimum thickness determined in accordance with the requirements in 6.7.3.4; and
- (b) The minimum thickness determined in accordance with the recognized pressure vessel code including the requirements in 6.7.3.3.

- 6.7.3.4.2** The cylindrical portions, ends (heads) and manhole covers of shells of not more than 1.80 m in diameter shall be not less than 5 mm thick in the reference steel or of equivalent thickness in the steel to be used. Shells of more than 1.80 m in diameter shall be not less than 6 mm thick in the reference steel or of equivalent thickness in the steel to be used.
- 6.7.3.4.3** The cylindrical portions, ends (heads) and manhole covers of all shells shall be not less than 4 mm thick regardless of the material of construction.
- 6.7.3.4.4** The equivalent thickness of a steel other than the thickness prescribed for the reference steel in 6.7.3.4.2 shall be determined using the following formula:

$$e_1 = \frac{21.4 e_0}{\sqrt[3]{R_{m1} A_1}}$$

where:

- $e_1$  = required equivalent thickness (in mm) of the steel to be used;  
 $e_0$  = minimum thickness (in mm) for the reference steel specified in 6.7.3.4.2;  
 $R_{m1}$  = guaranteed minimum tensile strength (in N/mm<sup>2</sup>) of the steel to be used (see 6.7.3.3.3);  
 $A_1$  = guaranteed minimum elongation at fracture (in %) of the steel to be used according to national or international standards.

- 6.7.3.4.5** In no case shall the wall thickness be less than that prescribed in 6.7.3.4.1 to 6.7.3.4.3. All parts of the shell shall have a minimum thickness as determined by 6.7.3.4.1 to 6.7.3.4.3. This thickness shall be exclusive of any corrosion allowance.
- 6.7.3.4.6** When mild steel is used (see 6.7.3.1), calculation using the formula in 6.7.3.4.4 is not required.
- 6.7.3.4.7** There shall be no sudden change of plate thickness at the attachment of the ends (heads) to the cylindrical portion of the shell.

### **6.7.3.5 Service equipment**

- 6.7.3.5.1** Service equipment shall be so arranged as to be protected against the risk of being wrenched off or damaged during handling and carriage. When the connection between the frame and the shell allows relative movement between the sub-assemblies, the equipment shall be so fastened as to permit such movement without risk of damage to working parts. The external discharge fittings (pipe sockets, shut-off devices), the internal stop-valve and its seating shall be protected against the danger of being wrenched off by external forces (for example using shear sections). The filling and discharge devices (including flanges or threaded plugs) and any protective caps shall be capable of being secured against unintended opening.
- 6.7.3.5.2** All openings with a diameter of more than 1.5 mm in shells of portable tanks, except openings for pressure-relief devices, inspection openings and closed bleed holes, shall be fitted with at least three mutually independent shut-off devices in series, the first being an internal stop-valve, excess flow valve or equivalent device, the second being an external stop-valve and the third being a blank flange or equivalent device.
- 6.7.3.5.2.1** When a portable tank is fitted with an excess flow valve, the excess flow valve shall be so fitted that its seating is inside the shell or inside a welded flange or, when fitted externally, its mountings shall be designed so that in the event of impact its effectiveness shall be maintained. The excess flow valves shall be selected and fitted so as to close automatically when the rated flow specified by the manufacturer is reached. Connections and accessories leading to or from such a valve shall have a capacity for a flow more than the rated flow of the excess flow valve.
- 6.7.3.5.3** For filling and discharge openings, the first shut-off device shall be an internal stop-valve and the second shall be a stop-valve placed in an accessible position on each discharge and filling pipe.
- 6.7.3.5.4** For filling and discharge bottom openings of portable tanks intended for the carriage of flammable and/or toxic non-refrigerated liquefied gases the internal stop-valve shall be a quick closing safety device which closes automatically in the event of unintended movement of the portable tank during filling or discharge or fire engulfment. Except for portable tanks having a capacity of not more than 1 000 litres, it shall be possible to operate this device by remote control.
- 6.7.3.5.5** In addition to filling, discharge and gas pressure equalizing orifices, shells may have openings in which gauges, thermometers and manometers can be fitted. Connections for such instruments shall be made by suitable welded nozzles or pockets and not be screwed connections through the shell.
- 6.7.3.5.6** All portable tanks shall be fitted with manholes or other inspection openings of suitable size to allow for internal inspection and adequate access for maintenance and repair of the interior.
- 6.7.3.5.7** External fittings shall be grouped together so far as reasonably practicable.

- 6.7.3.5.8** Each connection on a portable tank shall be clearly marked to indicate its function.
- 6.7.3.5.9** Each stop-valve or other means of closure shall be designed and constructed to a rated pressure not less than the MAWP of the shell taking into account the temperatures expected during carriage. All stop-valves with a screwed spindle shall close by a clockwise motion of the handwheel. For other stop-valves the position (open and closed) and direction of closure shall be clearly indicated. All stop-valves shall be designed to prevent unintentional opening.
- 6.7.3.5.10** Piping shall be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration. All piping shall be of suitable metallic material. Welded pipe joints shall be used wherever possible.
- 6.7.3.5.11** Joints in copper tubing shall be brazed or have an equally strong metal union. The melting point of brazing materials shall be no lower than 525 °C. The joints shall not decrease the strength of tubing as may happen when cutting threads.
- 6.7.3.5.12** The burst pressure of all piping and pipe fittings shall be not less than the highest of four times the MAWP of the shell or four times the pressure to which it may be subjected in service by the action of a pump or other device (except pressure-relief devices).
- 6.7.3.5.13** Ductile metals shall be used in the construction of valves and accessories.
- 6.7.3.6** **Bottom openings**
- 6.7.3.6.1** Certain non-refrigerated liquefied gases shall not be carried in portable tanks with bottom openings when portable tank instruction T50 in 4.2.5.2.6 indicates that bottom openings are not allowed. There shall be no openings below the liquid level of the shell when it is filled to its maximum permissible filling limit.
- 6.7.3.7** **Pressure-relief devices**
- 6.7.3.7.1** Portable tanks shall be provided with one or more spring-loaded pressure-relief devices. The pressure-relief devices shall open automatically at a pressure not less than the MAWP and be fully open at a pressure equal to 110% of the MAWP. These devices shall, after discharge, close at a pressure not lower than 10% below the pressure at which discharge starts and shall remain closed at all lower pressures. The pressure-relief devices shall be of a type that will resist dynamic forces including liquid surge. Frangible discs not in series with a spring-loaded pressure-relief device are not permitted.
- 6.7.3.7.2** Pressure-relief devices shall be designed to prevent the entry of foreign matter, the leakage of gas and the development of any dangerous excess pressure.
- 6.7.3.7.3** Portable tanks intended for the carriage of certain non-refrigerated liquefied gases identified in portable tank instruction T50 in 4.2.5.2.6 shall have a pressure-relief device approved by the competent authority. Unless a portable tank in dedicated service is fitted with an approved relief device constructed of materials compatible with the load, such device shall comprise a frangible disc preceding a spring-loaded device. The space between the frangible disc and the device shall be provided with a pressure gauge or a suitable tell-tale indicator. This arrangement permits the detection of disc rupture, pinholing or leakage which could cause a malfunction of the pressure-relief device. The frangible discs shall rupture at a nominal pressure 10% above the start-to-discharge pressure of the relief device.
- 6.7.3.7.4** In the case of multi-purpose portable tanks, the pressure-relief devices shall open at a pressure indicated in 6.7.3.7.1 for the gas having the highest maximum allowable pressure of the gases allowed to be carried in the portable tank.
- 6.7.3.8** **Capacity of relief devices**
- 6.7.3.8.1** The combined delivery capacity of the relief devices shall be sufficient that, in the event of total fire engulfment, the pressure (including accumulation) inside the shell does not exceed 120% of the MAWP. Spring-loaded relief devices shall be used to achieve the full relief capacity prescribed. In the case of multi-purpose tanks, the combined delivery capacity of the pressure-relief devices shall be taken for the gas which requires the highest delivery capacity of the gases allowed to be carried in portable tanks.
- 6.7.3.8.1.1** To determine the total required capacity of the relief devices, which shall be regarded as being the sum of the individual capacities of the several devices, the following formula<sup>5</sup> shall be used:

---

<sup>5</sup> This formula applies only to non-refrigerated liquefied gases which have critical temperatures well above the temperature at the accumulating condition. For gases which have critical temperatures near or below the temperature at the accumulating condition, the calculation of the pressure-relief device delivery capacity shall consider further thermodynamic properties of the gas (see for example CGA S-1.2-2003 "Pressure Relief Device Standards – Part 2 – Cargo and Portable Tanks for Compressed Gases").

$$Q = 12.4 \frac{FA^{0.82}}{LC} \sqrt{\frac{ZT}{M}}$$

where:

Q = minimum required rate of discharge in cubic metres of air per second (m<sup>3</sup>/s) at standard conditions: 1 bar and 0 °C (273 K);

F = is a coefficient with the following value:

for uninsulated shells: F = 1;

for insulated shells: F = U(649-t)/13.6 but in no case is less than 0.25

where:

U = thermal conductance of the insulation, in kW·m<sup>-2</sup>·K<sup>-1</sup>, at 38 °C;

t = actual temperature of the non-refrigerated liquefied gas during filling (°C); when this temperature is unknown, let t=15 °C;

The value of F given above for insulated shells may be taken provided that the insulation is in accordance with 6.7.3.8.1.2;

A = total external surface area of shell in square metres;

Z = the gas compressibility factor in the accumulating condition (when this factor is unknown, let Z =1.0);

T = absolute temperature in Kelvin (°C + 273) above the pressure relief devices in the accumulating condition;

L = the latent heat of vaporization of the liquid, in kJ/kg, in the accumulating condition;

M = molecular mass of the discharged gas;

C = a constant which is derived from one of the following formulae as a function of the ratio k of specific heats

$$k = \frac{c_p}{c_v}$$

where

c<sub>p</sub> is the specific heat at constant pressure; and

c<sub>v</sub> is the specific heat at constant volume.

when k>1:

$$C = \sqrt{k \left( \frac{2}{k+1} \right)^{\frac{k+1}{k-1}}}$$

when k = 1 or k is unknown:

$$C = \frac{1}{\sqrt{e}} = 0.607$$

where e is the mathematical constant 2.7183.

C may also be taken from the following table:

k	C	k	C	k	C
1.00	0.607	1.26	0.660	1.52	0.704
1.02	0.611	1.28	0.664	1.54	0.707
1.04	0.615	1.30	0.667	1.56	0.710
1.06	0.620	1.32	0.671	1.58	0.713
1.08	0.624	1.34	0.674	1.60	0.716
1.10	0.628	1.36	0.678	1.62	0.719
1.12	0.633	1.38	0.681	1.64	0.722
1.14	0.637	1.40	0.685	1.66	0.725
1.16	0.641	1.42	0.688	1.68	0.728
1.18	0.645	1.44	0.691	1.70	0.731
1.20	0.649	1.46	0.695	2.00	0.770
1.22	0.652	1.48	0.698	2.20	0.793
1.24	0.656	1.50	0.701		

**6.7.3.8.1.2** Insulation systems, used for the purpose of reducing the venting capacity, shall be approved by the competent authority or its authorized body. In all cases, insulation systems approved for this purpose shall:

(a) Remain effective at all temperatures up to 649 °C; and

(b) Be jacketed with a material having a melting point of 700 °C or greater.

**6.7.3.9 Marking of pressure-relief devices**

**6.7.3.9.1** Every pressure-relief device shall be plainly and permanently marked with the following particulars:

- (a) The pressure (in bar or kPa) at which it is set to discharge;
- (b) The allowable tolerance at the discharge pressure for spring-loaded devices;
- (c) The reference temperature corresponding to the rated pressure for frangible discs; and
- (d) The rated flow capacity of the device in standard cubic metres of air per second ( $\text{m}^3/\text{s}$ ).

When practicable, the following information shall also be shown:

- (e) The manufacturer's name and relevant catalogue number of the device.

**6.7.3.9.2** The rated flow capacity marked on the pressure-relief devices shall be determined according to ISO 4126-1:1991.

**6.7.3.10 Connections to pressure-relief devices**

**6.7.3.10.1** Connections to pressure-relief devices shall be of sufficient size to enable the required discharge to pass unrestricted to the safety device. No stop-valve shall be installed between the shell and the pressure-relief devices except when duplicate devices are provided for maintenance or other reasons and the stop-valves serving the devices actually in use are locked open or the stop-valves are interlocked so that at least one of the duplicate devices is always operable and capable of meeting the requirements of 6.7.3.8. There shall be no obstruction in an opening leading to a vent or pressure-relief device which might restrict or cut-off the flow from the shell to that device. Vents from the pressure-relief devices, when used, shall deliver the relieved vapour or liquid to the atmosphere in conditions of minimum back-pressure on the relieving device.

**6.7.3.11 Siting of pressure-relief devices**

**6.7.3.11.1** Each pressure-relief device inlet shall be situated on top of the shell in a position as near the longitudinal and transverse centre of the shell as reasonably practicable. All pressure relief device inlets shall under maximum filling conditions be situated in the vapour space of the shell and the devices shall be so arranged as to ensure that the escaping vapour is discharged unrestrictedly. For flammable non-refrigerated liquefied gases, the escaping vapour shall be directed away from the shell in such a manner that it cannot impinge upon the shell. Protective devices which deflect the flow of vapour are permissible provided the required relief-device capacity is not reduced.

**6.7.3.11.2** Arrangements shall be made to prevent access to the pressure-relief devices by unauthorized persons and to protect the devices from damage caused by the portable tank overturning.

**6.7.3.12 Gauging devices**

**6.7.3.12.1** Unless a portable tank is intended to be filled by weight it shall be equipped with one or more gauging devices. Glass level-gauges and gauges made of other fragile material, which are in direct communication with the contents of the shell shall not be used.

**6.7.3.13 Portable tank supports, frameworks, lifting and tie-down attachments**

**6.7.3.13.1** Portable tanks shall be designed and constructed with a support structure to provide a secure base during carriage. The forces specified in 6.7.3.2.9 and the safety factor specified in 6.7.3.2.10 shall be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.

**6.7.3.13.2** The combined stresses caused by portable tank mountings (e.g. cradles, frameworks, etc.) and portable tank lifting and tie-down attachments shall not cause excessive stress in any portion of the shell. Permanent lifting and tie-down attachments shall be fitted to all portable tanks. Preferably they shall be fitted to the portable tank supports but may be secured to reinforcing plates located on the shell at the points of support.

**6.7.3.13.3** In the design of supports and frameworks the effects of environmental corrosion shall be taken into account.

**6.7.3.13.4** Forklift pockets shall be capable of being closed off. The means of closing forklift pockets shall be a permanent part of the framework or permanently attached to the framework. Single compartment portable tanks with a length less than 3.65 m need not have closed off forklift pockets provided that:

- (a) The shell and all the fittings are well protected from being hit by the forklift blades; and
- (b) The distance between the centres of the forklift pockets is at least half of the maximum length of the portable tank.

**6.7.3.13.5** When portable tanks are not protected during carriage, according to 4.2.2.3, the shells and service equipment shall be protected against damage to the shell and service equipment resulting from lateral or longitudinal impact or overturning. External fittings shall be protected so as to preclude the release of the shell contents upon impact or overturning of the portable tank on its fittings. Examples of protection include:

- (a) Protection against lateral impact which may consist of longitudinal bars protecting the shell on both sides at the level of the median line;
- (b) Protection of the portable tank against overturning which may consist of reinforcement rings or bars fixed across the frame;
- (c) Protection against rear impact which may consist of a bumper or frame;
- (d) Protection of the shell against damage from impact or overturning by use of an ISO frame in accordance with ISO 1496-3:1995.

#### **6.7.3.14 Design approval**

**6.7.3.14.1** The competent authority or its authorized body shall issue a design approval certificate for any new design of a portable tank. This certificate shall attest that a portable tank has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this Chapter and where appropriate the provisions for gases provided in portable tank instruction T50 in 4.2.5.2.6. When a series of portable tanks are manufactured without change in the design, the certificate shall be valid for the entire series. The certificate shall refer to the prototype test report, the gases allowed to be carried, the materials of construction of the shell and an approval number. The approval number shall consist of the distinguishing sign or mark of the State in whose territory the approval was granted, i.e. the distinguishing sign for use in international traffic, as prescribed by the Convention on Road Traffic, Vienna 1968, and a registration number. Any alternative arrangements according to 6.7.1.2 shall be indicated on the certificate. A design approval may serve for the approval of smaller portable tanks made of materials of the same kind and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.

**6.7.3.14.2** The prototype test report for the design approval shall include at least the following:

- (a) The results of the applicable framework test specified in ISO 1496-3:1995;
- (b) The results of the initial inspection and test in 6.7.3.15.3; and
- (c) The results of the impact test in 6.7.3.15.1, when applicable.

#### **6.7.3.15 Inspection and testing**

**6.7.3.15.1** Portable tanks meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended, shall not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual of Tests and Criteria, Part IV, Section 41.

**6.7.3.15.2** The shell and items of equipment of each portable tank shall be inspected and tested before being put into service for the first time (initial inspection and test) and thereafter at not more than five-year intervals (5 year periodic inspection and test) with an intermediate periodic inspection and test (2.5 year periodic inspection and test) midway between the 5 year periodic inspections and tests. The 2.5 year inspection and test may be performed within 3 months of the specified date. An exceptional inspection and test shall be performed regardless of the last periodic inspection and test when necessary according to 6.7.3.15.7.

**6.7.3.15.3** The initial inspection and test of a portable tank shall include a check of the design characteristics, an internal and external examination of the portable tank and its fittings with due regard to the non-refrigerated liquefied gases to be carried, and a pressure test referring to the test pressures according to 6.7.3.3.2. The pressure test may be performed as a hydraulic test or by using another liquid or gas with the agreement of the competent authority or its authorized body. Before the portable tank is placed into service, a leakproofness test and a test of the satisfactory operation of all service equipment shall also be performed. When the shell and its fittings have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test. All welds subject to full stress level in the shell shall be inspected during the initial test by radiographic, ultrasonic, or another suitable non-destructive test method. This does not apply to the jacket.

**6.7.3.15.4** The 5 year periodic inspection and test shall include an internal and external examination and, as a general rule, a hydraulic pressure test. Sheathing, thermal insulation and the like shall be removed only to the extent required for reliable appraisal of the condition of the portable tank. When the shell and equipment have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.

**6.7.3.15.5** The intermediate 2.5 year periodic inspection and test shall at least include an internal and external examination of the portable tank and its fittings with due regard to the non-refrigerated liquefied gases intended to be carried, a leakproofness test and a check of the satisfactory operation of all service equipment. Sheathing thermal insulation and the like shall be removed only to the extent required for reliable appraisal of the condition of the portable tank. For portable tanks intended for the carriage of a single non-refrigerated liquefied gas, the 2.5 year internal examination may be waived or substituted by other test methods or inspection procedures specified by the competent authority or its authorized body.

- 6.7.3.15.6** A portable tank may not be filled and offered for carriage after the date of expiry of the last 5 year or 2.5 year periodic inspection and test as required by 6.7.3.15.2. However a portable tank filled prior to the date of expiry of the last periodic inspection and test may be carried for a period not to exceed three months beyond the date of expiry of the last periodic test or inspection. In addition, a portable tank may be carried after the date of expiry of the last periodic test and inspection:
- (a) After emptying but before cleaning, for purposes of performing the next required test or inspection prior to refilling; and
  - (b) Unless otherwise approved by the competent authority, for a period not to exceed six months beyond the date of expiry of the last periodic test or inspection, in order to allow the return of dangerous goods for proper disposal or recycling. Reference to this exemption shall be mentioned in the transport document.
- 6.7.3.15.7** The exceptional inspection and test is necessary when the portable tank shows evidence of damaged or corroded areas, or leakage, or other conditions that indicate a deficiency that could affect the integrity of the portable tank. The extent of the exceptional inspection and test shall depend on the amount of damage or deterioration of the portable tank. It shall include at least the 2.5 year inspection and test according to 6.7.3.15.5.
- 6.7.3.15.8** The internal and external examinations shall ensure that:
- (a) The shell is inspected for pitting, corrosion, or abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the portable tank unsafe for carriage;
  - (b) The piping, valves, and gaskets are inspected for corroded areas, defects, or any other conditions, including leakage, that might render the portable tank unsafe for filling, discharge or carriage;
  - (c) Devices for tightening manhole covers are operative and there is no leakage at manhole covers or gaskets;
  - (d) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
  - (e) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves shall be operated to demonstrate proper operation;
  - (f) Required markings on the portable tank are legible and in accordance with the applicable requirements; and
  - (g) The framework, the supports and the arrangements for lifting the portable tank are in satisfactory condition.
- 6.7.3.15.9** The inspections and tests in 6.7.3.15.1, 6.7.3.15.3, 6.7.3.15.4, 6.7.3.15.5 and 6.7.3.15.7 shall be performed or witnessed by an expert approved by the competent authority or its authorized body. When the pressure test is a part of the inspection and test, the test pressure shall be the one indicated on the data plate of the portable tank. While under pressure, the portable tank shall be inspected for any leaks in the shell, piping or equipment.
- 6.7.3.15.10** In all cases when cutting, burning or welding operations on the shell have been effected, that work shall be to the approval of the competent authority or its authorized body taking into account the pressure vessel code used for the construction of the shell. A pressure test to the original test pressure shall be performed after the work is completed.
- 6.7.3.15.11** When evidence of any unsafe condition is discovered, the portable tank shall not be returned to service until it has been corrected and the pressure test is repeated and passed.
- 6.7.3.16 Marking**
- 6.7.3.16.1** Every portable tank shall be fitted with a corrosion resistant metal plate permanently attached to the portable tank in a conspicuous place readily accessible for inspection. When for reasons of portable tank arrangements, the plate cannot be permanently attached to the shell, the shell shall be marked with at least the information required by the pressure vessel code. As a minimum at least the following information shall be marked on the plate by stamping or by any other similar method:

Country of manufacture

U	Approval	Approval	For Alternative Arrangements (see 6.7.1.2)
N	country	number	"AA"

Manufacturer's name or mark

Manufacturer's serial number

Authorized body for the design approval

Owner's registration number

Year of manufacture

Pressure vessel code to which the shell is designed

Test pressure \_\_\_\_\_ bar/kPa gauge<sup>6</sup>

MAWP \_\_\_\_\_ bar/kPa gauge<sup>6</sup>

External design pressure<sup>7</sup> \_\_\_\_\_ bar/kPa gauge<sup>6</sup>

Design temperature range \_\_\_\_\_ °C to \_\_\_\_\_ °C

Design reference temperature \_\_\_\_\_ °C

Water capacity at 20 °C \_\_\_\_\_ litres

Initial pressure test date and witness identification

Shell material(s) and material standard reference(s)

Equivalent thickness in reference steel \_\_\_\_\_ mm

Date and type of most recent periodic test(s)

Month \_\_\_\_\_ Year \_\_\_\_\_ Test pressure \_\_\_\_\_ bar/kPa gauge<sup>6</sup>

Stamp of expert who performed or witnessed the most recent test

**6.7.3.16.2** The following information shall be marked either on the portable tank itself or on a metal plate firmly secured to the portable tank:

Name of the operator

Name of non-refrigerated liquefied gas(es) permitted for carriage

Maximum permissible load mass for each non-refrigerated liquefied gas permitted \_\_\_\_\_ kg

Maximum permissible gross mass (MPGM) \_\_\_\_\_ kg

Unladen (tare) mass \_\_\_\_\_ kg

**NOTE:** For the identification of the non-refrigerated liquefied gases being carried, see also Part 5.

**6.7.3.16.3** If a portable tank is designed and approved for handling in open seas, the words "OFFSHORE PORTABLE TANK" shall be marked on the identification plate.

---

<sup>6</sup> The unit used shall be marked.

<sup>7</sup> See 6.7.3.2.8.

#### 6.7.4 Requirements for the design, construction, inspection and testing of portable tanks intended for the carriage of refrigerated liquefied gases

##### 6.7.4.1 Definitions

For the purposes of this section:

*Alternative arrangement* means an approval granted by the competent authority for a portable tank or MEGC that has been designed, constructed or tested to technical requirements or testing methods other than those specified in this Chapter;

*Holding time* means the time that will elapse from the establishment of the initial filling condition until the pressure has risen due to heat influx to the lowest set pressure of the pressure limiting device(s);

*Jacket* means the outer insulation cover or cladding which may be part of the insulation system;

*Leakproofness test* means a test using gas subjecting the shell and its service equipment, to an effective internal pressure not less than 90% of the MAWP;

*Maximum allowable working pressure (MAWP)* means the maximum effective gauge pressure permissible at the top of the shell of a loaded portable tank in its operating position including the highest effective pressure during filling and discharge;

*Maximum permissible gross mass (MPGM)* means the sum of the tare mass of the portable tank and the heaviest load authorized for carriage;

*Minimum design temperature* means the temperature which is used for the design and construction of the shell not higher than the lowest (coldest) temperature (service temperature) of the contents during normal conditions of filling, discharge and carriage;

*Portable tank* means a thermally insulated multimodal tank having a capacity of more than 450 litres fitted with service equipment and structural equipment necessary for the carriage of refrigerated liquefied gases. The portable tank shall be capable of being filled and discharged without the removal of its structural equipment. It shall possess stabilizing members external to the tank, and shall be capable of being lifted when full. It shall be designed primarily to be loaded onto a vehicle, wagon or sea-going or inland navigation vessel and shall be equipped with skids, mountings or accessories to facilitate mechanical handling. Tank-vehicles, tank-wagons, non-metallic tanks, intermediate bulk containers (IBCs), gas cylinders and large receptacles are not considered to fall within the definition for portable tanks;

*Reference steel* means a steel with a tensile strength of 370 N/mm<sup>2</sup> and an elongation at fracture of 27%;

*Service equipment* means measuring instruments and filling, discharge, venting, safety, pressurizing, cooling and thermal insulation devices;

*Shell* means the part of the portable tank which retains the refrigerated liquefied gas intended for carriage, including openings and their closures, but does not include service equipment or external structural equipment;

*Structural equipment* means the reinforcing, fastening, protective and stabilizing members external to the shell;

*Tank* means a construction which normally consists of either :

- (a) A jacket and one or more inner shells where the space between the shell(s) and the jacket is exhausted of air (vacuum insulation) and may incorporate a thermal insulation system; or
- (b) A jacket and an inner shell with an intermediate layer of solid thermally insulating material (e.g. solid foam);

*Test pressure* means the maximum gauge pressure at the top of the shell during the pressure test.

##### 6.7.4.2 General design and construction requirements

- 6.7.4.2.1 Shells shall be designed and constructed in accordance with the requirements of a pressure vessel code recognized by the competent authority. Shells and jackets shall be made of metallic materials suitable for forming. Jackets shall be made of steel. Non-metallic materials may be used for the attachments and supports between the shell and jacket, provided their material properties at the minimum design temperature are proven to be sufficient. The materials shall in principle conform to national or international material standards. For welded shells and jackets only materials whose weldability has been fully demonstrated shall be used. Welds shall be skilfully made and afford complete safety. When the manufacturing process or the materials make it necessary, the shell shall be suitably heat treated to guarantee adequate toughness in the weld and in the heat affected zones. In choosing the material, the minimum design temperature shall be taken into account with respect to risk of brittle fracture, to hydrogen embrittlement, to stress corro-

sion cracking and to resistance to impact. When fine grain steel is used, the guaranteed value of the yield strength shall be not more than 460 N/mm<sup>2</sup> and the guaranteed value of the upper limit of the tensile strength shall be not more than 725 N/mm<sup>2</sup> in accordance with the material specifications. Portable tank materials shall be suitable for the external environment in which they may be carried.

- 6.7.4.2.2** Any part of a portable tank, including fittings, gaskets and pipe-work, which can be expected normally to come into contact with the refrigerated liquefied gas carried shall be compatible with that refrigerated liquefied gas.
- 6.7.4.2.3** Contact between dissimilar metals which could result in damage by galvanic action shall be avoided.
- 6.7.4.2.4** The thermal insulation system shall include a complete covering of the shell(s) with effective insulating materials. External insulation shall be protected by a jacket so as to prevent the ingress of moisture and other damage under normal carriage conditions.
- 6.7.4.2.5** When a jacket is so closed as to be gas-tight, a device shall be provided to prevent any dangerous pressure from developing in the insulation space.
- 6.7.4.2.6** Portable tanks intended for the carriage of refrigerated liquefied gases having a boiling point below minus (–)182 °C at atmospheric pressure shall not include materials which may react with oxygen or oxygen enriched atmospheres in a dangerous manner, when located in parts of the thermal insulation when there is a risk of contact with oxygen or with oxygen enriched fluid.
- 6.7.4.2.7** Insulating materials shall not deteriorate unduly in service.
- 6.7.4.2.8** A reference holding time shall be determined for each refrigerated liquefied gas intended for carriage in a portable tank.
- 6.7.4.2.8.1** The reference holding time shall be determined by a method recognized by the competent authority on the basis of the following:
- (a) The effectiveness of the insulation system, determined in accordance with 6.7.4.2.8.2;
  - (b) The lowest set pressure of the pressure limiting device(s);
  - (c) The initial filling conditions;
  - (d) An assumed ambient temperature of 30 °C;
  - (e) The physical properties of the individual refrigerated liquefied gas intended to be carried.
- 6.7.4.2.8.2** The effectiveness of the insulation system (heat influx in watts) shall be determined by type testing the portable tank in accordance with a procedure recognized by the competent authority. This test shall consist of either:
- (a) A constant pressure test (for example at atmospheric pressure) when the loss of refrigerated liquefied gas is measured over a period of time; or
  - (b) A closed system test when the rise in pressure in the shell is measured over a period of time.
- When performing the constant pressure test, variations in atmospheric pressure shall be taken into account. When performing either tests corrections shall be made for any variation of the ambient temperature from the assumed ambient temperature reference value of 30 °C.
- NOTE:** For the determination of the actual holding time before each journey, refer to 4.2.3.7.
- 6.7.4.2.9** The jacket of a vacuum-insulated double-wall tank shall have either an external design pressure not less than 100 kPa (1 bar) (gauge pressure) calculated in accordance with a recognized technical code or a calculated critical collapsing pressure of not less than 200 kPa (2 bar) (gauge pressure). Internal and external reinforcements may be included in calculating the ability of the jacket to resist the external pressure.
- 6.7.4.2.10** Portable tanks shall be designed and constructed with supports to provide a secure base during carriage and with suitable lifting and tie-down attachments.
- 6.7.4.2.11** Portable tanks shall be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and carriage. The design shall demonstrate that the effects of fatigue, caused by repeated application of these loads through the expected life of the portable tank, have been taken into account.
- 6.7.4.2.12** Portable tanks and their fastenings under the maximum permissible load shall be capable of absorbing the following separately applied static forces:
- (a) In the direction of travel: twice the MPGM multiplied by the acceleration due to gravity (g)<sup>8</sup>;

---

<sup>8</sup> For calculation purposes  $g = 9.81 \text{ m/s}^2$ .

- (b) Horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces shall be equal to twice the MPGM) multiplied by the acceleration due to gravity ( $g$ )<sup>8</sup>;
- (c) Vertically upwards: the MPGM multiplied by the acceleration due to gravity ( $g$ )<sup>8</sup>; and
- (d) Vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity ( $g$ )<sup>8</sup>.

**6.7.4.2.13** Under each of the forces in 6.7.4.2.12, the safety factor to be observed shall be as follows:

- (a) For materials having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; and
- (b) For materials with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength or, in case of austenitic steels, the 1% proof strength.

**6.7.4.2.14** The values of yield strength or proof strength shall be the values according to national or international material standards. When austenitic steels are used, the specified minimum values according to the material standards may be increased by up to 15% when greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, or when non-metallic materials are used the values of yield strength or proof strength shall be approved by the competent authority.

**6.7.4.2.15** Portable tanks intended for the carriage of flammable refrigerated liquefied gases shall be capable of being electrically earthed.

#### **6.7.4.3 Design criteria**

**6.7.4.3.1** Shells shall be of a circular cross section.

**6.7.4.3.2** Shells shall be designed and constructed to withstand a test pressure not less than 1.3 times the MAWP. For shells with vacuum insulation the test pressure shall not be less than 1.3 times the sum of the MAWP and 100 kPa (1 bar). In no case shall the test pressure be less than 300 kPa (3 bar) (gauge pressure). Attention is drawn to the minimum shell thickness requirements, specified in 6.7.4.4.2 to 6.7.4.4.7.

**6.7.4.3.3** For metals exhibiting a clearly defined yield point or characterized by a guaranteed proof strength (0.2% proof strength, generally, or 1% proof strength for austenitic steels) the primary membrane stress  $\sigma$  (sigma) in the shell shall not exceed 0.75 Re or 0.50 Rm, whichever is lower, at the test pressure, where:

Re = yield strength in N/mm<sup>2</sup>, or 0.2% proof strength or, for austenitic steels, 1% proof strength;

Rm = minimum tensile strength in N/mm<sup>2</sup>.

**6.7.4.3.3.1** The values of Re and Rm to be used shall be the specified minimum values according to national or international material standards. When austenitic steels are used, the specified minimum values for Re and Rm according to the material standards may be increased by up to 15% when greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, the values of Re and Rm used shall be approved by the competent authority or its authorized body.

**6.7.4.3.3.2** Steels which have a Re/Rm ratio of more than 0.85 are not allowed for the construction of welded shells. The values of Re and Rm to be used in determining this ratio shall be the values specified in the material inspection certificate.

**6.7.4.3.3.3** Steels used in the construction of shells shall have an elongation at fracture, in %, of not less than 10 000/Rm with an absolute minimum of 16% for fine grain steels and 20% for other steels. Aluminium and aluminium alloys used in the construction of shells shall have an elongation at fracture, in %, of not less than 10 000/6Rm with an absolute minimum of 12%.

**6.7.4.3.3.4** For the purpose of determining actual values for materials, it shall be noted that for sheet metal, the axis of the tensile test specimen shall be at right angles (transversely) to the direction of rolling. The permanent elongation at fracture shall be measured on test specimens of rectangular cross sections in accordance with ISO 6892:1988 using a 50 mm gauge length.

#### **6.7.4.4 Minimum shell thickness**

**6.7.4.4.1** The minimum shell thickness shall be the greater thickness based on:

- (a) The minimum thickness determined in accordance with the requirements in 6.7.4.4.2 to 6.7.4.4.7; or
- (b) The minimum thickness determined in accordance with the recognized pressure vessel code including the requirements in 6.7.4.3.

**6.7.4.4.2** Shells of not more than 1.80 m in diameter shall be not less than 5 mm thick in the reference steel or of equivalent thickness in the metal to be used. Shells of more than 1.80 m in diameter shall be not less than 6 mm thick in the reference steel or of equivalent thickness in the metal to be used.

- 6.7.4.4.3** Shells of vacuum-insulated tanks of not more than 1.80 m in diameter shall be not less than 3 mm thick in the reference steel or of equivalent thickness in the metal to be used. Such shells of more than 1.80 m in diameter shall be not less than 4 mm thick in the reference steel or of equivalent thickness in the metal to be used.
- 6.7.4.4.4** For vacuum-insulated tanks, the aggregate thickness of the jacket and the shell shall correspond to the minimum thickness prescribed in 6.7.4.4.2, the thickness of the shell itself being not less than the minimum thickness prescribed in 6.7.4.4.3.
- 6.7.4.4.5** Shells shall be not less than 3 mm thick regardless of the material of construction.
- 6.7.4.4.6** The equivalent thickness of a metal other than the thickness prescribed for the reference steel in 6.7.4.4.2 and 6.7.4.4.3 shall be determined using the following formula:

$$e_1 = \frac{21.4 e_0}{\sqrt[3]{Rm_1 A_1}}$$

where:

- $e_1$  = required equivalent thickness (in mm) of the metal to be used;  
 $e_0$  = minimum thickness (in mm) of the reference steel specified in 6.7.4.4.2 and 6.7.4.4.3;  
 $Rm_1$  = guaranteed minimum tensile strength (in N/mm<sup>2</sup>) of the metal to be used (see 6.7.4.3.3);  
 $A_1$  = guaranteed minimum elongation at fracture (in %) of the metal to be used according to national or international standards.

- 6.7.4.4.7** In no case shall the wall thickness be less than that prescribed in 6.7.4.4.1 to 6.7.4.4.5. All parts of the shell shall have a minimum thickness as determined by 6.7.4.4.1 to 6.7.4.4.6. This thickness shall be exclusive of any corrosion allowance.
- 6.7.4.4.8** There shall be no sudden change of plate thickness at the attachment of the ends (heads) to the cylindrical portion of the shell.
- 6.7.4.5 Service equipment**
- 6.7.4.5.1** Service equipment shall be so arranged as to be protected against the risk of being wrenched off or damaged during handling and carriage. When the connection between the frame and the tank or the jacket and the shell allows relative movement, the equipment shall be so fastened as to permit such movement without risk of damage to working parts. The external discharge fittings (pipe sockets, shut-off devices), the stop-valve and its seating shall be protected against the danger of being wrenched off by external forces (for example using shear sections). The filling and discharge devices (including flanges or threaded plugs) and any protective caps shall be capable of being secured against unintended opening.
- 6.7.4.5.2** Each filling and discharge opening in portable tanks used for the carriage of flammable refrigerated liquefied gases shall be fitted with at least three mutually independent shut-off devices in series, the first being a stop-valve situated as close as reasonably practicable to the jacket, the second being a stop-valve and the third being a blank flange or equivalent device. The shut-off device closest to the jacket shall be a quick closing device, which closes automatically in the event of unintended movement of the portable tank during filling or discharge or fire engulfment. This device shall also be possible to operate by remote control.
- 6.7.4.5.3** Each filling and discharge opening in portable tanks used for the carriage of non-flammable refrigerated liquefied gases shall be fitted with at least two mutually independent shut-off devices in series, the first being a stop-valve situated as close as reasonably practicable to the jacket, the second a blank flange or equivalent device.
- 6.7.4.5.4** For sections of piping which can be closed at both ends and where liquid product can be trapped, a method of automatic pressure relief shall be provided to prevent excess pressure build-up within the piping.
- 6.7.4.5.5** Vacuum insulated tanks need not have an opening for inspection.
- 6.7.4.5.6** External fittings shall be grouped together so far as reasonably practicable.
- 6.7.4.5.7** Each connection on a portable tank shall be clearly marked to indicate its function.
- 6.7.4.5.8** Each stop-valve or other means of closure shall be designed and constructed to a rated pressure not less than the MAWP of the shell taking into account the temperature expected during carriage. All stop-valves with a screwed spindle shall be closed by a clockwise motion of the handwheel. In the case of other stop-valves the position (open and closed) and direction of closure shall be clearly indicated. All stop-valves shall be designed to prevent unintentional opening.

- 6.7.4.5.9** When pressure-building units are used, the liquid and vapour connections to that unit shall be provided with a valve as close to the jacket as reasonably practicable to prevent the loss of contents in case of damage to the pressure-building unit.
- 6.7.4.5.10** Piping shall be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration. All piping shall be of a suitable material. To prevent leakage due to fire, only steel piping and welded joints shall be used between the jacket and the connection to the first closure of any outlet. The method of attaching the closure to this connection shall be to the satisfaction of the competent authority or its authorized body. Elsewhere pipe joints shall be welded when necessary.
- 6.7.4.5.11** Joints in copper tubing shall be brazed or have an equally strong metal union. The melting point of brazing materials shall be no lower than 525 °C. The joints shall not decrease the strength of the tubing as may happen when cutting threads.
- 6.7.4.5.12** The materials of construction of valves and accessories shall have satisfactory properties at the lowest operating temperature of the portable tank.
- 6.7.4.5.13** The burst pressure of all piping and pipe fittings shall be not less than the highest of four times the MAWP of the shell or four times the pressure to which it may be subjected in service by the action of a pump or other device (except pressure-relief devices).
- 6.7.4.6 Pressure-relief devices**
- 6.7.4.6.1** Every shell shall be provided with not less than two independent spring-loaded pressure-relief devices. The pressure-relief devices shall open automatically at a pressure not less than the MAWP and be fully open at a pressure equal to 110% of the MAWP. These devices shall, after discharge, close at a pressure not lower than 10% below the pressure at which discharge starts and shall remain closed at all lower pressures. The pressure-relief devices shall be of the type that will resist dynamic forces including surge.
- 6.7.4.6.2** Shells for non-flammable refrigerated liquefied gases and hydrogen may in addition have frangible discs in parallel with the spring-loaded devices as specified in 6.7.4.7.2 and 6.7.4.7.3.
- 6.7.4.6.3** Pressure-relief devices shall be designed to prevent the entry of foreign matter, the leakage of gas and the development of any dangerous excess pressure.
- 6.7.4.6.4** Pressure-relief devices shall be approved by the competent authority or its authorized body.
- 6.7.4.7 Capacity and setting of pressure-relief devices**
- 6.7.4.7.1** In the case of the loss of vacuum in a vacuum-insulated tank or of loss of 20% of the insulation of a tank insulated with solid materials, the combined capacity of all pressure-relief devices installed shall be sufficient so that the pressure (including accumulation) inside the shell does not exceed 120% of the MAWP.
- 6.7.4.7.2** For non-flammable refrigerated liquefied gases (except oxygen) and hydrogen, this capacity may be achieved by the use of frangible discs in parallel with the required safety-relief devices. Frangible discs shall rupture at nominal pressure equal to the test pressure of the shell.
- 6.7.4.7.3** Under the circumstances described in 6.7.4.7.1 and 6.7.4.7.2 together with complete fire engulfment the combined capacity of all pressure-relief devices installed shall be sufficient to limit the pressure in the shell to the test pressure.
- 6.7.4.7.4** The required capacity of the relief devices shall be calculated in accordance with a well-established technical code recognized by the competent authority<sup>9</sup>.
- 6.7.4.8 Marking of pressure-relief devices**
- 6.7.4.8.1** Every pressure-relief device shall be plainly and permanently marked with the following particulars:
- (a) The pressure (in bar or kPa) at which it is set to discharge;
  - (b) The allowable tolerance at the discharge pressure for spring-loaded devices;
  - (c) The reference temperature corresponding to the rated pressure for frangible discs; and
  - (d) The rated flow capacity of the device in standard cubic meters of air per second (m<sup>3</sup>/s).
- When practicable, the following information shall also be shown:
- (e) The manufacturer's name and relevant catalogue number of the device.

---

<sup>9</sup> See for example CGA S-1.2-2003 "Pressure Relief Device Standards – Part 2 – Cargo and Portable Tanks for Compressed Gases".

**6.7.4.8.2** The rated flow capacity marked on the pressure-relief devices shall be determined according to ISO 4126-1:1991.

**6.7.4.9 Connections to pressure-relief devices**

**6.7.4.9.1** Connections to pressure-relief devices shall be of sufficient size to enable the required discharge to pass unrestricted to the safety device. No stop-valve shall be installed between the shell and the pressure-relief devices except when duplicate devices are provided for maintenance or other reasons and the stop-valves serving the devices actually in use are locked open or the stop-valves are interlocked so that the requirements of 6.7.4.7 are always fulfilled. There shall be no obstruction in an opening leading to a vent or pressure-relief device which might restrict or cut-off the flow from the shell to that device. Pipework to vent the vapour or liquid from the outlet of the pressure-relief devices, when used, shall deliver the relieved vapour or liquid to the atmosphere in conditions of minimum back-pressure on the relieving device.

**6.7.4.10 Siting of pressure-relief devices**

**6.7.4.10.1** Each pressure-relief device inlet shall be situated on top of the shell in a position as near the longitudinal and transverse centre of the shell as reasonably practicable. All pressure-relief device inlets shall under maximum filling conditions be situated in the vapour space of the shell and the devices shall be so arranged as to ensure that the escaping vapour is discharged unrestrictedly. For refrigerated liquefied gases, the escaping vapour shall be directed away from the tank and in such a manner that it cannot impinge upon the tank. Protective devices which deflect the flow of vapour are permissible provided the required relief-device capacity is not reduced.

**6.7.4.10.2** Arrangements shall be made to prevent access to the devices by unauthorized persons and to protect the devices from damage caused by the portable tank overturning.

**6.7.4.11 Gauging devices**

**6.7.4.11.1** Unless a portable tank is intended to be filled by weight, it shall be equipped with one or more gauging devices. Glass level-gauges and gauges made of other fragile material, which are in direct communication with the contents of the shell shall not be used.

**6.7.4.11.2** A connection for a vacuum gauge shall be provided in the jacket of a vacuum-insulated portable tank.

**6.7.4.12 Portable tank supports, frameworks, lifting and tie-down attachments**

**6.7.4.12.1** Portable tanks shall be designed and constructed with a support structure to provide a secure base during carriage. The forces specified in 6.7.4.2.12 and the safety factor specified in 6.7.4.2.13 shall be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.

**6.7.4.12.2** The combined stresses caused by portable tank mountings (e.g. cradles, frameworks, etc.) and portable tank lifting and tie-down attachments shall not cause excessive stress in any portion of the tank. Permanent lifting and tie-down attachments shall be fitted to all portable tanks. Preferably they shall be fitted to the portable tank supports but may be secured to reinforcing plates located on the tank at the points of support.

**6.7.4.12.3** In the design of supports and frameworks the effects of environmental corrosion shall be taken into account.

**6.7.4.12.4** Forklift pockets shall be capable of being closed off. The means of closing forklift pockets shall be a permanent part of the framework or permanently attached to the framework. Single compartment portable tanks with a length less than 3.65 m need not have closed off forklift pockets provided that:

- (a) The tank and all the fittings are well protected from being hit by the forklift blades; and
- (b) The distance between the centres of the forklift pockets is at least half of the maximum length of the portable tank.

**6.7.4.12.5** When portable tanks are not protected during carriage, according to 4.2.3.3, the shells and service equipment shall be protected against damage to the shell and service equipment resulting from lateral or longitudinal impact or overturning. External fittings shall be protected so as to preclude the release of the shell contents upon impact or overturning of the portable tank on its fittings. Examples of protection include:

- (a) Protection against lateral impact which may consist of longitudinal bars protecting the shell on both sides at the level of the median line;
- (b) Protection of the portable tank against overturning which may consist of reinforcement rings or bars fixed across the frame;
- (c) Protection against rear impact which may consist of a bumper or frame;
- (d) Protection of the shell against damage from impact or overturning by use of an ISO frame in accordance with ISO 1496-3:1995;
- (e) Protection of the portable tank from impact or overturning by a vacuum insulation jacket.

**6.7.4.13 Design approval**

**6.7.4.13.1** The competent authority or its authorized body shall issue a design approval certificate for any new design of a portable tank. This certificate shall attest that a portable tank has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this Chapter. When a series of portable tanks are manufactured without change in the design, the certificate shall be valid for the entire series. The certificate shall refer to the prototype test report, the refrigerated liquefied gases allowed to be carried, the materials of construction of the shell and jacket and an approval number. The approval number shall consist of the distinguishing sign or mark of the State in whose territory the approval was granted, i.e. the distinguishing sign for use in international traffic, as prescribed by the Convention on Road Traffic, Vienna 1968, and a registration number. Any alternative arrangements according to 6.7.1.2 shall be indicated on the certificate. A design approval may serve for the approval of smaller portable tanks made of materials of the same kind and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.

**6.7.4.13.2** The prototype test report for the design approval shall include at least the following:

- (a) The results of the applicable frame-work test specified in ISO 1496-3:1995;
- (b) The results of the initial inspection and test in 6.7.4.14.3; and
- (c) The results of the impact test in 6.7.4.14.1, when applicable.

**6.7.4.14 Inspection and testing**

**6.7.4.14.1** Portable tanks meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended, shall not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual of Tests and Criteria, Part IV, Section 41.

**6.7.4.14.2** The shell and items of equipment of each portable tank shall be inspected and tested before being put into service for the first time (initial inspection and test) and thereafter at not more than five-year intervals (5 year periodic inspection and test) with an intermediate periodic inspection and test (2.5 year periodic inspection and test) midway between the 5 year periodic inspections and tests. The 2.5 year inspection and test may be performed within 3 months of the specified date. An exceptional inspection and test shall be performed regardless of the last periodic inspection and test when necessary according to 6.7.4.14.7.

**6.7.4.14.3** The initial inspection and test of a portable tank shall include a check of the design characteristics, an internal and external examination of the portable tank shell and its fittings with due regard to the refrigerated liquefied gases to be carried, and a pressure test referring to the test pressures according to 6.7.4.3.2. The pressure test may be performed as a hydraulic test or by using another liquid or gas with the agreement of the competent authority or its authorized body. Before the portable tank is placed into service, a leakproofness test and a check of the satisfactory operation of all service equipment shall also be performed. When the shell and its fittings have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test. All welds subject to full stress level shall be inspected during the initial test by radiographic, ultrasonic, or another suitable non-destructive test method. This does not apply to the jacket.

**6.7.4.14.4** The 5 and 2.5 year periodic inspections and tests shall include an external examination of the portable tank and its fittings with due regard to the refrigerated liquefied gases carried, a leakproofness test, a check of the satisfactory operation of all service equipment and a vacuum reading, when applicable. In the case of non-vacuum insulated tanks, the jacket and insulation shall be removed during the 2.5 year and the 5 year periodic inspections and tests but only to the extent necessary for a reliable appraisal.

**6.7.4.14.5** (Deleted)

**6.7.4.14.6** A portable tank may not be filled and offered for carriage after the date of expiry of the last 5 year or 2.5 year periodic inspection and test as required by 6.7.4.14.2. However a portable tank filled prior to the date of expiry of the last periodic inspection and test may be carried for a period not to exceed three months beyond the date of expiry of the last periodic test or inspection. In addition, a portable tank may be carried after the date of expiry of the last periodic test and inspection:

- (a) After emptying but before cleaning, for purposes of performing the next required test or inspection prior to refilling; and
- (b) Unless otherwise approved by the competent authority, for a period not to exceed six months beyond the date of expiry of the last periodic test or inspection, in order to allow the return of dangerous goods for proper disposal or recycling. Reference to this exemption shall be mentioned in the transport document.

- 6.7.4.14.7** The exceptional inspection and test is necessary when the portable tank shows evidence of damaged or corroded areas, leakage, or any other conditions that indicate a deficiency that could affect the integrity of the portable tank. The extent of the exceptional inspection and test shall depend on the amount of damage or deterioration of the portable tank. It shall include at least the 2.5 year inspection and test according to 6.7.4.14.4.
- 6.7.4.14.8** The internal examination during the initial inspection and test shall ensure that the shell is inspected for pitting, corrosion, or abrasions, dents, distortions, defects in welds or any other conditions, that might render the portable tank unsafe for carriage.
- 6.7.4.14.9** The external examination shall ensure that:
- (a) The external piping, valves, pressurizing/cooling systems when applicable and gaskets are inspected for corroded areas, defects, or any other conditions, including leakage, that might render the portable tank unsafe for filling, discharge or carriage;
  - (b) There is no leakage at any manhole covers or gaskets;
  - (c) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
  - (d) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves shall be operated to demonstrate proper operation;
  - (e) Required markings on the portable tank are legible and in accordance with the applicable requirements; and
  - (f) The framework, the supports and the arrangements for lifting the portable tank are in satisfactory condition.
- 6.7.4.14.10** The inspections and tests in 6.7.4.14.1, 6.7.4.14.3, 6.7.4.14.4, 6.7.4.14.5 and 6.7.4.14.7 shall be performed or witnessed by an expert approved by the competent authority or its authorized body. When the pressure test is a part of the inspection and test, the test pressure shall be the one indicated on the data plate of the portable tank. While under pressure, the portable tank shall be inspected for any leaks in the shell, piping or equipment.
- 6.7.4.14.11** In all cases when cutting, burning or welding operations on the shell of a portable tank have been effected, that work shall be to the approval of the competent authority or its authorized body taking into account the pressure vessel code used for the construction of the shell. A pressure test to the original test pressure shall be performed after the work is completed.
- 6.7.4.14.12** When evidence of any unsafe condition is discovered, the portable tank shall not be returned to service until it has been corrected and the test is repeated and passed.
- 6.7.4.15 Marking**
- 6.7.4.15.1** Every portable tank shall be fitted with a corrosion resistant metal plate permanently attached to the portable tank in a conspicuous place readily accessible for inspection. When for reasons of portable tank arrangements, the plate cannot be permanently attached to the shell, the shell shall be marked with at least the information required by the pressure vessel code. As a minimum at least the following information shall be marked on the plate by stamping or by any other similar method:

Country of manufacture

U	Approval	Approval	For Alternative Arrangements (see 6.7.1.2)
N	country	number	

"AA"

Manufacturer's name or mark

Manufacturer's serial number

Authorized body for the design approval

Owner's registration number

Year of manufacture

Pressure vessel code to which the shell is designed

Test pressure \_\_\_\_\_ bar/kPa gauge<sup>10</sup>

MAWP \_\_\_\_\_ bar/kPa gauge<sup>10</sup>

<sup>10</sup> The unit used shall be marked.

Minimum design temperature \_\_\_\_\_ °C

Water capacity at 20 °C \_\_\_\_\_ litres

Initial pressure test date and witness identification

Shell material(s) and material standard reference(s)

Equivalent thickness in reference steel \_\_\_\_\_ mm

Date and type of most recent periodic test(s)

Month \_\_\_\_\_ Year \_\_\_\_\_ Test pressure \_\_\_\_\_ bar/kPa gauge<sup>10</sup>

Stamp of expert who performed or witnessed the most recent test

The name, in full, of the gas(es) for whose carriage the portable tank is approved

Either "thermally insulated" or "vacuum insulated" \_\_\_\_\_

Effectiveness of the insulation system (heat influx) \_\_\_\_\_ Watts (W)

Reference holding time \_\_\_\_\_ days (or hours) and initial pressure \_\_\_\_\_ bar/kPa gauge<sup>10</sup> and degree of filling \_\_\_\_\_ in kg for each refrigerated liquefied gas permitted for carriage.

- 6.7.4.15.2** The following particulars shall be durably marked either on the portable tank itself or on a metal plate firmly secured to the portable tank.

Name of the owner and the operator

Name of the refrigerated liquefied gas being carried (and minimum mean bulk temperature)

Maximum permissible gross mass (MPGM) \_\_\_\_\_ kg

Unladen (tare) mass \_\_\_\_\_ kg

Actual holding time for gas being carried \_\_\_\_\_ days (or hours)

**NOTE:** For the identification of the refrigerated liquefied gas(es) being carried, see also Part 5.

- 6.7.4.15.3** If a portable tank is designed and approved for handling in open seas, the words "OFFSHORE PORTABLE TANK" shall be marked on the identification plate.

## **6.7.5 Requirements for the design, construction, inspection and testing of UN multiple-element gas containers (MEGCs) intended for the carriage of non-refrigerated gases**

### **6.7.5.1 Definitions**

For the purposes of this section:

*Alternative arrangement* means an approval granted by the competent authority for a portable tank or MEGC that has been designed, constructed or tested to technical requirements or testing methods other than those specified in this Chapter;

*Elements* are cylinders, tubes or bundles of cylinders;

*Leakproofness test* means a test using gas subjecting the elements and the service equipment of the MEGC to an effective internal pressure of not less than 20% of the test pressure;

*Manifold* means an assembly of piping and valves connecting the filling and/or discharge openings of the elements;

*Maximum permissible gross mass (MPGM)* means the sum of the tare mass of the MEGC and the heaviest load authorized for carriage;

*Service equipment* means measuring instruments and filling, discharge, venting and safety devices;

*Structural equipment* means the reinforcing, fastening, protective and stabilizing members external to the elements;

*UN multiple-element gas containers (MEGCs)* are multimodal assemblies of cylinders, tubes and bundles of cylinders which are interconnected by a manifold and which are assembled within a framework. The MEGC includes service equipment and structural equipment necessary for the carriage of gases.

### **6.7.5.2 General design and construction requirements**

**6.7.5.2.1** The MEGC shall be capable of being filled and discharged without the removal of its structural equipment. It shall possess stabilizing members external to the elements to provide structural integrity for handling and carriage. MEGCs shall be designed and constructed with supports to provide a secure base during carriage and with lifting and tie-down attachments which are adequate for lifting the MEGC including when filled to its maximum permissible gross mass. The MEGC shall be designed to be loaded onto a **vehicle, wagon or sea-going or inland navigation vessel** and shall be equipped with skids, mountings or accessories to facilitate mechanical handling.

**6.7.5.2.2** MEGCs shall be designed, manufactured and equipped in such a way as to withstand all conditions to which they will be subjected during normal conditions of handling and carriage. The design shall take into account the effects of dynamic loading and fatigue.

**6.7.5.2.3** Elements of an MEGC shall be made of seamless steel and be constructed and tested according to **6.2.1 and 6.2.2**. All of the elements in an MEGC shall be of the same design type.

**6.7.5.2.4** Elements of MEGCs, fittings and pipework shall be:  
(a) compatible with the substances intended to be carried (see ISO 11114-1:1997 and ISO 11114-2:2000);  
or  
(b) properly passivated or neutralized by chemical reaction.

**6.7.5.2.5** Contact between dissimilar metals which could result in damage by galvanic action shall be avoided.

**6.7.5.2.6** The materials of the MEGC, including any devices, gaskets, and accessories, shall not adversely affect the gas(es) intended for carriage in the MEGC.

**6.7.5.2.7** MEGCs shall be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and carriage. The design shall demonstrate that the effects of fatigue, caused by repeated application of these loads through the expected life of the multiple-element gas container, have been taken into account.

**6.7.5.2.8** MEGCs and their fastenings shall, under the maximum permissible load, be capable of withstanding the following separately applied static forces:

(a) in the direction of travel: twice the MPGM multiplied by the acceleration due to gravity ( $g$ )<sup>11</sup>;

---

<sup>11</sup> For calculation purposes  $g = 9.81 \text{ m/s}^2$ .

- (b) horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces shall be equal to twice the MPGM) multiplied by the acceleration due to gravity ( $g$ )<sup>11</sup>;
- (c) vertically upwards: the MPGM multiplied by the acceleration due to gravity ( $g$ )<sup>11</sup>; and
- (d) vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity ( $g$ )<sup>11</sup>.

**6.7.5.2.9** Under the forces defined in 6.7.5.2.8, the stress at the most severely stressed point of the elements shall not exceed the values given in either the relevant standards of 6.2.2.1 or, if the elements are not designed, constructed and tested according to those standards, in the technical code or standard recognised or approved by the competent authority of the country of use (see 6.2.5).

**6.7.5.2.10** Under each of the forces in 6.7.5.2.8, the safety factor for the framework and fastenings to be observed shall be as follows:

- (a) for steels having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; or
- (b) for steels with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength and, for austenitic steels, the 1% proof strength.

**6.7.5.2.11** MEGCs intended for the carriage of flammable gases shall be capable of being electrically earthed.

**6.7.5.2.12** The elements shall be secured in a manner that prevents undesired movement in relation to the structure and the concentration of harmful localized stresses.

#### **6.7.5.3 Service equipment**

**6.7.5.3.1** Service equipment shall be configured or designed to prevent damage that could result in the release of the pressure receptacle contents during normal conditions of handling and carriage. When the connection between the frame and the elements allows relative movement between the sub-assemblies, the equipment shall be so fastened as to permit such movement without damage to working parts. The manifolds, the discharge fittings (pipe sockets, shut-off devices), and the stop-valves shall be protected from being wrenched off by external forces. Manifold piping leading to shut-off valves shall be sufficiently flexible to protect the valves and the piping from shearing, or releasing the pressure receptacle contents. The filling and discharge devices (including flanges or threaded plugs) and any protective caps shall be capable of being secured against unintended opening.

**6.7.5.3.2** Each element intended for the carriage of toxic gases (gases of groups T, TF, TC, TO, TFC and TOC) shall be fitted with a valve. The manifold for liquefied toxic gases (gases of classification codes 2T, 2TF, 2TC, 2TO, 2TFC and 2TOC) shall be so designed that the elements can be filled separately and be kept isolated by a valve capable of being sealed. For the carriage of flammable gases (gases of group F), the elements shall be **divided into groups** of not more than 3 000 litres **each isolated by a valve**.

**6.7.5.3.3** For filling and discharge openings of the MEGC, two valves in series shall be placed in an accessible position on each discharge and filling pipe. One of the valves may be a non-return valve. The filling and discharge devices may be fitted to a manifold. For sections of piping which can be closed at both ends and where a liquid product can be trapped, a pressure-relief valve shall be provided to prevent excessive pressure build-up. The main isolation valves on an MEGC shall be clearly marked to indicate their directions of closure. Each stop-valve or other means of closure shall be designed and constructed to withstand a pressure equal to or greater than 1.5 times the test pressure of the MEGC. All stop-valves with screwed spindles shall close by a clockwise motion of the handwheel. For other stop-valves, the position (open and closed) and direction of closure shall be clearly indicated. All stop-valves shall be designed and positioned to prevent unintentional opening. Ductile metals shall be used in the construction of valves or accessories.

**6.7.5.3.4** Piping shall be designed, constructed and installed so as to avoid damage due to expansion and contraction, mechanical shock and vibration. Joints in tubing shall be brazed or have an equally strong metal union. The melting point of brazing materials shall be no lower than 525 °C. The rated pressure of the service equipment and of the manifold shall be not less than two thirds of the test pressure of the elements.

#### **6.7.5.4 Pressure-relief devices**

**6.7.5.4.1** The elements of MEGCs used for the carriage of UN No. 1013 carbon dioxide and UN No. 1070 nitrous oxide shall be **divided into groups** of not more than 3 000 litres **each isolated by a valve**. Each **group** shall be fitted with one or more pressure relief devices. MEGCs for other gases shall be fitted with pressure relief devices as specified by the competent authority for the country of use.

**6.7.5.4.2** When pressure relief devices are fitted, every element or group of elements of an MEGC that can be isolated shall then be fitted with one or more pressure relief devices. Pressure relief devices shall be of a type that will resist dynamic forces including liquid surge and shall be designed to prevent the entry of foreign matter, the leakage of gas and the development of any dangerous excess pressure.

- 6.7.5.4.3** MEGCs used for the carriage of certain non-refrigerated gases identified in portable tank instruction T50 in 4.2.5.2.6 may have a pressure-relief device as required by the competent authority of the country of use. Unless an MEGC in dedicated service is fitted with an approved pressure relief device constructed of materials compatible with the gas carried, such a device shall comprise a frangible disc preceding a spring-loaded device. The space between the frangible disc and the spring-loaded device may be equipped with a pressure gauge or a suitable telltale indicator. This arrangement permits the detection of disc rupture, pinholing or leakage which could cause a malfunction of the pressure relief device. The frangible disc shall rupture at a nominal pressure 10% above the start-to-discharge pressure of the spring-loaded device.
- 6.7.5.4.4** In the case of multi-purpose MEGCs used for the carriage of low-pressure liquefied gases, the pressure-relief devices shall open at a pressure as specified in 6.7.3.7.1 for the gas having the highest maximum allowable working pressure of the gases allowed to be carried in the MEGC.
- 6.7.5.5 Capacity of pressure relief devices**
- 6.7.5.5.1** The combined delivery capacity of the pressure relief devices when fitted shall be sufficient that, in the event of total fire engulfment of the MEGC, the pressure (including accumulation) inside the elements does not exceed 120% of the set pressure of the pressure relief device. The formula provided in CGA S-1.2-2003 "Pressure Relief Device Standards – Part 2 – Cargo and Portable Tanks for Compressed Gases" shall be used to determine the minimum total flow capacity for the system of pressure relief devices. CGA S-1.1-2003 "Pressure Relief Device Standards – Part 1 – Cylinders for Compressed Gases" may be used to determine the relief capacity of individual elements. Spring-loaded pressure relief devices may be used to achieve the full relief capacity prescribed in the case of low pressure liquefied gases. In the case of multi-purpose MEGCs, the combined delivery capacity of the pressure-relief devices shall be taken for the gas which requires the highest delivery capacity of the gases allowed to be carried in the MEGC.
- 6.7.5.5.2** To determine the total required capacity of the pressure relief devices installed on the elements for the carriage of liquefied gases, the thermodynamic properties of the gas shall be considered (see, for example, CGA S-1.2-2003 "Pressure Relief Device Standards – Part 2 – Cargo and Portable Tanks for Compressed Gases" for low pressure liquefied gases and CGA S-1.1-2003 "Pressure Relief Device Standards – Part 1 – Cylinders for Compressed Gases" for high pressure liquefied gases).
- 6.7.5.6 Marking of pressure-relief devices**
- 6.7.5.6.1** Pressure relief devices shall be clearly and permanently marked with the following:
- (a) the manufacturer's name and relevant catalogue number;
  - (b) the set pressure and/or the set temperature;
  - (c) the date of the last test.
- 6.7.5.6.2** The rated flow capacity marked on spring loaded pressure relief devices for low pressure liquefied gases shall be determined according to ISO 4126-1:1991.
- 6.7.5.7 Connections to pressure-relief devices**
- 6.7.5.7.1** Connections to pressure-relief devices shall be of sufficient size to enable the required discharge to pass unrestricted to the pressure relief device. No stop-valve shall be installed between the element and the pressure-relief devices, except when duplicate devices are provided for maintenance or other reasons, and the stop-valves serving the devices actually in use are locked open, or the stop-valves are interlocked so that at least one of the duplicate devices is always operable and capable of meeting the requirements of 6.7.5.5. There shall be no obstruction in an opening leading to or leaving from a vent or pressure-relief device which might restrict or cut-off the flow from the element to that device. The opening through all piping and fittings shall have at least the same flow area as the inlet of the pressure relief device to which it is connected. The nominal size of the discharge piping shall be at least as large as that of the pressure relief device outlet. Vents from the pressure-relief devices, when used, shall deliver the relieved vapour or liquid to the atmosphere in conditions of minimum back-pressure on the relieving device.
- 6.7.5.8 Siting of pressure-relief devices**
- 6.7.5.8.1** Each pressure relief device shall, under maximum filling conditions, be in communication with the vapour space of the elements for the carriage of liquefied gases. The devices, when fitted, shall be so arranged as to ensure that the escaping vapour is discharged upwards and unrestrictedly as to prevent any impingement of escaping gas or liquid upon the MEGC, its elements or personnel. For flammable, pyrophoric and oxidizing gases, the escaping gas shall be directed away from the element in such a manner that it cannot impinge upon the other elements. Heat resistant protective devices which deflect the flow of gas are permissible provided the required pressure relief device capacity is not reduced.
- 6.7.5.8.2** Arrangements shall be made to prevent access to the pressure-relief devices by unauthorized persons and to protect the devices from damage caused by the MEGC overturning.

**6.7.5.9 Gauging devices**

- 6.7.5.9.1** When an MEGC is intended to be filled by mass, it shall be equipped with one or more gauging devices. Level-gauges made of glass or other fragile material shall not be used.

**6.7.5.10 MEGC supports, frameworks, lifting and tie-down attachments**

- 6.7.5.10.1** MEGCs shall be designed and constructed with a support structure to provide a secure base during carriage. The forces specified in 6.7.5.2.8 and the safety factor specified in 6.7.5.2.10 shall be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.
- 6.7.5.10.2** The combined stresses caused by element mountings (e.g. cradles, frameworks, etc.) and MEGC lifting and tie-down attachments shall not cause excessive stress in any element. Permanent lifting and tie-down attachments shall be fitted to all MEGCs. In no case shall mountings or attachments be welded onto the elements.
- 6.7.5.10.3** In the design of supports and frameworks, the effects of environmental corrosion shall be taken into account.
- 6.7.5.10.4** When MEGCs are not protected during carriage, according to 4.2.5.3, the elements and service equipment shall be protected against damage resulting from lateral or longitudinal impact or overturning. External fittings shall be protected so as to preclude the release of the elements' contents upon impact or overturning of the MEGC on its fittings. Particular attention shall be paid to the protection of the manifold. Examples of protection include:
- (a) protection against lateral impact which may consist of longitudinal bars;
  - (b) protection against overturning which may consist of reinforcement rings or bars fixed across the frame;
  - (c) protection against rear impact which may consist of a bumper or frame;
  - (d) protection of the elements and service equipment against damage from impact or overturning by use of an ISO frame in accordance with the relevant provisions of ISO 1496-3:1995.

**6.7.5.11 Design approval**

- 6.7.5.11.1** The competent authority or its authorized body shall issue a design approval certificate for any new design of an MEGC. This certificate shall attest that the MEGC has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this Chapter, the applicable provisions for gases of Chapter 4.1 and of packing instruction P200. When a series of MEGCs are manufactured without change in the design, the certificate shall be valid for the entire series. The certificate shall refer to the prototype test report, the materials of construction of the manifold, the standards to which the elements are made and an approval number. The approval number shall consist of the distinguishing sign or mark of the country granting the approval, i.e. the distinguishing sign for use in international traffic, as prescribed by the Convention on Road Traffic, Vienna 1968, and a registration number. Any alternative arrangements according to 6.7.1.2 shall be indicated on the certificate. A design approval may serve for the approval of smaller MEGCs made of materials of the same type and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.
- 6.7.5.11.2** The prototype test report for the design approval shall include at least the following:
- (a) the results of the applicable framework test specified in ISO 1496-3:1995;
  - (b) the results of the initial inspection and test specified in 6.7.5.12.3;
  - (c) the results of the impact test specified in 6.7.5.12.1; and
  - (d) certification documents verifying that the cylinders and tubes comply with the applicable standards.

**6.7.5.12 Inspection and testing**

- 6.7.5.12.1** MEGCs meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended, shall not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual of Tests and Criteria, Part IV, Section 41.
- 6.7.5.12.2** The elements and items of equipment of each MEGC shall be inspected and tested before being put into service for the first time (initial inspection and test). Thereafter, MEGCs shall be inspected at no more than five-year intervals (5 year periodic inspection). An exceptional inspection and test shall be performed, regardless of the last periodic inspection and test, when necessary according to 6.7.5.12.5.

- 6.7.5.12.3** The initial inspection and test of an MEGC shall include a check of the design characteristics, an external examination of the MEGC and its fittings with due regard to the gases to be carried, and a pressure test performed at the test pressures according to packing instruction P200 of 4.1.4.1. The pressure test of the manifold may be performed as a hydraulic test or by using another liquid or gas with the agreement of the competent authority or its authorized body. Before the MEGC is placed into service, a leakproofness test and a test of the satisfactory operation of all service equipment shall also be performed. When the elements and their fittings have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.
- 6.7.5.12.4** The 5-year periodic inspection and test shall include an external examination of the structure, the elements and the service equipment in accordance with 6.7.5.12.6. The elements and the piping shall be tested at the periodicity specified in packing instruction P200 and in accordance with the provisions described in 6.2.1.6. When the elements and equipment have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.
- 6.7.5.12.5** An exceptional inspection and test is necessary when the MEGC shows evidence of damaged or corroded areas, leakage, or other conditions that indicate a deficiency that could affect the integrity of the MEGC. The extent of the exceptional inspection and test shall depend on the amount of damage or deterioration of the MEGC. It shall include at least the examinations required under 6.7.5.12.6.
- 6.7.5.12.6** The examinations shall ensure that:
- (a) the elements are inspected externally for pitting, corrosion, abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the MEGC unsafe for carriage;
  - (b) the piping, valves, and gaskets are inspected for corroded areas, defects, and other conditions, including leakage, that might render the MEGC unsafe for filling, discharge or carriage;
  - (c) missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
  - (d) all emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves shall be operated to demonstrate proper operation;
  - (e) required markings on the MEGC are legible and in accordance with the applicable requirements; and
  - (f) the framework, the supports and the arrangements for lifting the MEGC are in satisfactory condition.
- 6.7.5.12.7** The inspections and tests in 6.7.5.12.1, 6.7.5.12.3, 6.7.5.12.4 and 6.7.5.12.5 shall be performed or witnessed by a body authorized by the competent authority. When the pressure test is a part of the inspection and test, the test pressure shall be the one indicated on the data plate of the MEGC. While under pressure, the MEGC shall be inspected for any leaks in the elements, piping or equipment.
- 6.7.5.12.8** When evidence of any unsafe condition is discovered, the MEGC shall not be returned to service until it has been corrected and the applicable tests and verifications are passed.
- 6.7.5.13 Marking**
- 6.7.5.13.1** Every MEGC shall be fitted with a corrosion resistant metal plate permanently attached to the MEGC in a conspicuous place readily accessible for inspection. The elements shall be marked in accordance with Chapter 6.2. At least the following information shall be marked on the plate by stamping or by any other similar method:

Country of manufacture

U	Approval	Approval	For Alternative Arrangements (see 6.7.1.2)
N	country	number	"AA"

Manufacturer's name or mark

Manufacturer's serial number

Authorized body for the design approval

Year of manufacture

Test pressure: \_\_\_\_\_ bar gauge

Design temperature range \_\_\_\_\_ °C to \_\_\_\_\_ °C

Number of elements \_\_\_\_\_

Total water capacity \_\_\_\_\_ litres

Initial pressure test date and identification of the authorized body

Date and type of most recent periodic tests

Month \_\_\_\_\_ Year \_\_\_\_\_

Stamp of the authorized body which performed or witnessed the most recent test

**NOTE:** No metal plate may be fixed to the elements.

**6.7.5.13.2** The following information shall be marked on a metal plate firmly secured to the MEGC:

Name of the operator

Maximum permissible load mass \_\_\_\_\_ kg

Working pressure at 15 °C: \_\_\_\_\_ bar gauge

Maximum permissible gross mass (MPGM) \_\_\_\_\_ kg

Unladen (tare) mass \_\_\_\_\_ kg

## Chapter 6.8

### Requirements for the construction, equipment, type approval, inspections and tests, and marking of tank-wagons, demountable tanks and tank-containers and tank swap bodies, with shells made of metallic materials, and battery-wagons and multiple element gas containers (MEGCs)

**NOTE:** For portable tanks and UN multiple-element gas containers (MEGCs) see Chapter 6.7, for fibre-reinforced plastics tank-containers see Chapter 6.9, for vacuum-operated waste tanks see Chapter 6.10.

#### 6.8.1 Scope

**6.8.1.1** The requirements across the whole width of the page apply both to tank-wagons, to demountable tanks and battery-wagons, and to tank-containers, tank swap bodies and MEGCs. Those contained in a single column apply only:

- to tank-wagons, demountable tanks and battery-wagons (left hand column);
- to tank-containers, tank swap bodies and MEGCs (right hand column).

**6.8.1.2** These requirements shall apply to tank-wagons, demountable tanks and battery-wagons | tank-containers, tank swap bodies and MEGCs used for the carriage of gaseous, liquid, powdery or granular substances.

**6.8.1.3** Section 6.8.2 sets out the requirements applicable to tank-wagons, to demountable tanks, tank-containers, tank swap bodies intended for the carriage of substances of all classes and battery-wagons and MEGCs for gases of Class 2. Sections 6.8.3 to 6.8.5 contain special requirements supplementing or modifying the requirements of section 6.8.2.

**6.8.1.4** For provisions concerning use of these tanks, see Chapter 4.3.

#### 6.8.2 Requirements applicable to all classes

##### 6.8.2.1 Construction

##### *Basic principles*

**6.8.2.1.1** Shells, their service and structural equipment shall be designed to withstand without loss of contents (other than quantities of gas escaping through any degassing vents):

- static and dynamic stresses in normal conditions of carriage as defined in 6.8.2.1.2 and 6.8.2.1.13;
- prescribed minimum stresses as defined in 6.8.2.1.15.

**6.8.2.1.2** Tank-wagons shall be constructed as to be capable of withstanding, under the maximum permissible load, the stresses which occur during carriage by rail. As regards these stresses, reference should be made to the tests prescribed by the competent authority.

Tank-containers and their fastenings shall, under the maximum permissible load be capable of absorbing the forces equal to those exerted by:

- in the direction of travel: twice the total mass;
- horizontally at right angles to the direction of travel: the total mass; (where the direction of travel is not clearly determined, twice the total mass in each direction);
- vertically upwards: the total mass;
- vertically downwards: twice the total mass.

**6.8.2.1.3** The walls of the shells shall have at least the thickness specified in 6.8.2.1.17 and 6.8.2.1.18. | 6.8.2.1.17 to 6.8.2.1.20.

**6.8.2.1.4** Shells shall be designed and constructed in accordance with the requirements of standards listed in 6.8.2.6 or of a technical code recognized by the competent authority, in accordance with 6.8.2.7, in which the material is chosen and the shell thickness determined taking into account maximum and minimum filling and working temperatures, but the following minimum requirements of 6.8.2.1.6 to 6.8.2.1.26 shall be met.

**6.8.2.1.5** Tanks intended to contain certain dangerous substances shall be provided with additional protection. This may take the form of additional thickness of the shell (increased calculation pressure) determined in the light of the dangers inherent in the substances concerned or of a protective device (see the special provisions of 6.8.4).

**6.8.2.1.6** Welds shall be skilfully made and shall afford the fullest safety. The execution and checking of welds shall comply with the requirements of 6.8.2.1.23.

**6.8.2.1.7** Measures shall be taken to protect shells against the risk of deformation as a result of a negative internal pressure.

Shells, other than shells according to 6.8.2.2.6, designed to be equipped with vacuum valves shall be able to withstand, without permanent deformation, an external pressure of not less than 21 kPa (0.21 bar) above the internal pressure. Shells used for the carriage of solid substances (powdery or granular) of packing groups II or III only, which do not liquefy during carriage, may be designed for a lower external pressure but not less than 5 kPa (0.05 bar). The vacuum valves shall be set to relieve at a vacuum setting not greater than the tank's design vacuum pressure. Shells, which are not designed to be equipped with a vacuum valve shall be able to withstand, without permanent deformation an external pressure of not less than 40 kPa (0.4 bar) above the internal pressure.

**Materials for shells**

**6.8.2.1.8** Shells shall be made of suitable metallic materials which, unless other temperature ranges are prescribed in the various classes, shall be resistant to brittle fracture and to stress corrosion cracking between  $-20\text{ }^{\circ}\text{C}$  and  $+50\text{ }^{\circ}\text{C}$ .

**6.8.2.1.9** The materials of shells or of their protective linings which are in contact with the contents shall not contain substances liable to react dangerously (see "Dangerous reaction" in 1.2.1) with the contents, to form dangerous compounds, or substantially to weaken the material.

If contact between the substance carried and the material used for the construction of the shell entails a progressive decrease in the shell thickness, this thickness shall be increased at manufacture by an appropriate amount. This additional thickness to allow for corrosion shall not be taken into consideration in calculating the shell thickness.

**6.8.2.1.10** For welded shells only materials of faultless weldability whose adequate impact strength at an ambient temperature of  $-20\text{ }^{\circ}\text{C}$  can be guaranteed, particularly in the weld seams and the zones adjacent thereto, shall be used.

Water-quenched steel may not be used for welded steel shells. If fine-grained steel is used, the guaranteed value of the yield strength  $R_e$  shall not exceed  $460\text{ N/mm}^2$  and the guaranteed value of the upper limit of tensile strength  $R_m$  shall not exceed  $725\text{ N/mm}^2$ , in accordance with the specifications of the material.

**6.8.2.1.11** Ratios of  $R_e/R_m$  exceeding 0.85 are not allowed for steels used in the construction of welded tanks.

$R_e$  = apparent yield strength for steels having a clearly-defined yield point or  
guaranteed 0.2% proof strength for steels with no clearly-defined yield point (1% for austenitic steels)

$R_m$  = tensile strength.

The values specified in the inspection certificate for the material shall be taken as a basis in determining this ratio in each case.

**6.8.2.1.12** For steel, the elongation at fracture, in % shall be not less than

$$\frac{10\,000}{\text{determined tensile strength in N/mm}^2}$$
 but in any case for fine-grained steels it shall be not less than

16 % and not less than 20 % for other steels.

For aluminium alloys the elongation at fracture shall be not less than 12%<sup>1</sup>.

<sup>1</sup> In the case of sheet metal the axis of the tensile test-piece shall be at right angles to the direction of rolling. The permanent elongation at fracture shall be measured on test-pieces of circular cross-section in which the gauge length  $l$  is equal to five times the diameter  $d$  ( $l = 5d$ ); if test-pieces of rectangular section are used, the gauge length shall be calculated by the formula

$$l = 5.65 \sqrt{F_0}$$

where  $F_0$  indicates the initial cross-section area of the test-piece.

**Calculation of the shell thickness**

- 6.8.2.1.13** The pressure on which the shell thickness is based shall not be less than the calculation pressure, but the stresses referred to in 6.8.2.1.1 shall also be taken into account, and, if necessary, the following stresses:

In the case of wagons in which the tank constitutes a stressed self-supporting member, the shell shall be designed to withstand the stresses thus imposed in addition to stresses from other sources.

Under each of these stresses the safety factors to be observed shall be the following:

- for metals having a clearly-defined yield point: a safety factor of 1.5 in relation to the apparent yield strength; or
- for metals with no clearly-defined yield point: a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength (1% maximum elongation for austenitic steels).

- 6.8.2.1.14** The calculation pressure is in the second part of the code (see 4.3.4.1) according to Column (12) of Table A of Chapter 3.2.

When "G" appears, the following requirements shall apply:

- (a) Gravity-discharge shells intended for the carriage of substances having a vapour pressure not exceeding 110 kPa (1.1 bar) (absolute pressure) at 50 °C shall be designed for a calculation pressure of twice the static pressure of the substance to be carried but not less than twice the static pressure of water.
- (b) Pressure-filled or pressure-discharge shells intended for the carriage of substances having a vapour pressure not exceeding 110 kPa (1.1 bar) (absolute pressure) at 50 °C shall be designed for a calculation pressure equal to 1.3 times the filling or discharge pressure.

When the numerical value of the minimum calculation pressure is given (gauge pressure) the shell shall be designed for this pressure which shall not be less than 1.3 times the filling or discharge pressure. The following minimum requirements shall apply in these cases:

- (c) Shells intended for the carriage of substances having a vapour pressure of more than 110 kPa (1.1 bar) at 50 °C and a boiling point of more than 35 °C shall, whatever their filling or discharge system, be designed for a calculation pressure of not less than 150 kPa (1.5 bar) gauge pressure or 1.3 times the filling or discharge pressure, whichever is the higher.
- (d) Shells intended for the carriage of substances having a boiling point of not more than 35 °C shall, whatever their filling or discharge system, be designed for a calculation pressure equal to 1.3 times the filling or discharge pressure but not less than 0.4 MPa (4 bar) (gauge pressure).

- 6.8.2.1.15** At the test pressure, the stress  $\sigma$  at the most severely stressed point of the shell shall not exceed the material-dependent limits prescribed below. Allowance shall be made for any weakening due to the welds.

- 6.8.2.1.16** For all metals and alloys, the stress  $\sigma$  at the test pressure shall be lower than the smaller of the values given by the following formulae:

$$\sigma \leq 0.75 R_e \text{ or } \sigma \leq 0.5 R_m$$

where

$R_e$  = apparent yield strength for steels having a clearly-defined yield point or  
0,2%-Dehngrenze für Stähle ohne ausgeprägter Streckgrenze (1%-Dehngrenze für austenitische Stähle)

$R_m$  = tensile strength.

The values of  $R_e$  and  $R_m$  to be used shall be specified minimum values according to material standards. If no material standard exists for the metal or alloy in question, the values of  $R_e$  and  $R_m$  used shall be approved by the competent authority or by a body designated by that authority.

When austenitic steels are used, the specified minimum values according to the material standards may be exceeded by up to 15% if these higher values are attested in the inspection certificate. The minimum values shall, however, not be exceeded when the formula given in 6.8.2.1.18 is applied.

**Minimum shell thickness**

**6.8.2.1.17** The shell thickness shall not be less than the greater of the values determined by the following formulae:

$$e = \frac{P_T D}{2 \sigma \lambda}$$

$$e = \frac{P_C D}{2 \sigma}$$

where:

$e$  = minimum shell thickness in mm

$P_T$  = test pressure in MPa

$P_C$  = calculation pressure in MPa as specified in 6.8.2.1.14

$D$  = internal diameter of shell in mm

$\sigma$  = permissible stress, as defined in 6.8.2.1.16, in N/mm<sup>2</sup>

$\lambda$  = a coefficient not exceeding 1, allowing for any weakening due to welds, and linked to the inspection methods defined in 6.8.2.1.23.

The thickness shall in no case be less than that defined in 6.8.2.1.18.

6.8.2.1.18 to 6.8.2.1.20.

**6.8.2.1.18** Shells shall be not less than 6 mm thick if of mild steel<sup>2</sup>, or of equivalent thickness if of another metal. For powdery or granular substances, this thickness may be reduced to 5 mm for mild steel or to an equivalent thickness for other metals.

Shells shall be not less than 5 mm thick if of mild steel<sup>2</sup> (in conformity with the requirements of 6.8.2.1.11 and 6.8.2.1.12) or of equivalent thickness if of another metal.

Whichever metal is used, the minimum wall thickness of the shell shall in no case be less than 4.5 mm.

Where the diameter is more than 1.80 m<sup>3</sup>, this thickness shall be increased to 6 mm except in the case of tanks intended for the carriage of powdery or granular substances, if the shell is of mild steel<sup>2</sup> or to an equivalent thickness if of another metal.

Whatever the metal used, the shell thickness shall in no case be less than 3 mm.

"Equivalent thickness" means the thickness obtained by the following formula<sup>4</sup>:

$$e_1 = \frac{464 e_0}{\sqrt[3]{(Rm_1 A_1)^2}}$$

<sup>2</sup> For the definitions of "mild steel" and "reference steel" see 1.2.1.

<sup>3</sup> For shells not of a circular cross-section, for example box-shaped or elliptical shells, the indicated diameters shall correspond to those calculated on the basis of a circular cross-section of the same area. For such shapes of cross-section the radius of convexity of the shell wall shall not exceed 2 000 mm at the sides or 3 000 mm at the top and bottom.

<sup>4</sup> This formula is derived from the general formula:

$$e_1 = e_0 \sqrt[3]{\left( \frac{Rm_0 A_0}{Rm_1 A_1} \right)^2}$$

where

$e_1$  = minimum shell thickness for the metal chosen, in mm;

$e_0$  = minimum shell thickness for mild steel, in mm, according to 6.8.2.1.18 and 6.8.2.1.19;

$Rm_0$  = 370 (tensile strength for reference steel, see definition 1.2.1, in N/mm<sup>2</sup>);

$A_0$  = 27 (elongation at fracture for reference steel, in %);

$Rm_1$  = minimum tensile strength of the metal chosen, in N/mm<sup>2</sup>; and

**6.8.2.1.19** (Reserved)

Where protection of the tank against damage is provided according to 6.8.2.1.20, the competent authority may allow the aforesaid minimum thicknesses to be reduced in proportion to the protection provided; however, the said thicknesses shall be not less than 3 mm in the case of mild steel<sup>2</sup>, or than an equivalent thickness in the case of other materials, for shells not more than 1.80 m<sup>3</sup> in diameter. For shells of a diameter exceeding 1.80 m<sup>3</sup> this minimum thickness shall be increased to 4 mm in the case of mild steel<sup>2</sup>, and to an equivalent thickness in the case of other metals.

Equivalent thickness means the thickness given by the formula in 6.8.2.1.18.

The thickness of shells with protection against damage in accordance with 6.8.2.1.20 shall not be less than the values given in the table below:

Minimum thickness of shells	Diameter of shell	≤ 1.80 m	> 1.80 m
	Stainless austenitic steels	2.5 mm	3 mm
	Other steels	3 mm	4 mm
	Aluminium alloys	4 mm	5 mm
	Pure aluminium of 99.80%	6 mm	8 mm

**6.8.2.1.20** (Reserved)

The protection referred to in 6.8.2.1.19 may consist of:

- overall external structural protection as in "sandwich" construction where the sheathing is secured to the shell; or
- a structure in which the shell is supported by a complete skeleton including longitudinal and transverse structural members; or
- double-wall construction.

Where the tanks are made with double walls, the space between being evacuated of air, the aggregate thickness of the outer metal wall and the shell wall shall correspond to the minimum wall thickness prescribed in 6.8.2.1.18, the thickness of the wall of the shell itself being not less than the minimum thickness prescribed in 6.8.2.1.19.

Where tanks are made with double walls with an intermediate layer of solid materials at least 50 mm thick, the outer wall shall have a thickness of not less than 0.5 mm if it is made of mild steel<sup>2</sup> or at least 2 mm if it is made of a plastics material reinforced with glass fibre. Solid foam with an impact absorption capacity such as that, for example, of polyurethane foam, may be used as the intermediate layer of solid material.

**6.8.2.1.21** (Reserved)**6.8.2.1.22** (Reserved)

---

A<sub>1</sub> = minimum elongation at fracture of the metal chosen under tensile stress, in %.

***Welding and inspection of welds***

- 6.8.2.1.23** The manufacturer's qualification for performing welding operations shall be one recognized by the competent authority. Welding shall be performed by skilled welders using a welding process whose effectiveness (including any heat treatments required) has been demonstrated by test. Non-destructive tests shall be carried out by radiography or by ultrasound and must confirm that the quality of the welding is appropriate to the stresses.

The following checks shall be carried out in accordance with the value of the coefficient  $\lambda$  used in determining the thickness of the shell in 6.8.2.1.17:

- $\lambda = 0.8$ : the weld beads shall so far as possible be inspected visually on both faces and shall be subjected to a non-destructive spot check. All weld "Tee" junctions with the total length of weld examined to be not less than 10% of the sum of the length of all longitudinal, circumferential and radial (in the tank ends) welds shall be tested;
- $\lambda = 0.9$ : all longitudinal beads throughout their length, all connections, 25% of circular beads, and welds for the assembly of large-diameter items of equipment shall be subjected to non-destructive checks. Beads shall be checked visually on both sides as far as possible;
- $\lambda = 1$ : all beads shall be subjected to non-destructive checks and are so far as possible inspected visually on both sides. A weld test-piece shall be taken.

Where the competent authority has doubts regarding the quality of weld beads, it may require additional checks.

***Other construction requirements***

- 6.8.2.1.24** The protective lining shall be so designed that its leakproofness remains intact, whatever the deformation liable to occur in normal conditions of carriage (see 6.8.2.1.2).
- 6.8.2.1.25** The thermal insulation shall be so designed as not to hinder access to, or the operation of, filling and discharge devices and safety valves.
- 6.8.2.1.26** If shells intended for the carriage of flammable liquids having a flash-point of not more than 60 °C are fitted with non-metallic protective linings (inner layers), the shells and the protective linings shall be so designed that no danger of ignition from electrostatic charges can occur.
- |                   |  |  |
|-------------------|--|--|
| <b>6.8.2.1.27</b> | All parts of tank-wagons intended for the carriage of liquids having a flash-point of not more than 60 °C and for the carriage of flammable gases, or of UN No. 1361 carbon or UN No. 1361 carbon black, Packing Group II, shall be linked to the chassis by means of electrical connection and shall be capable of being electrically earthed. Any metal contact capable of causing electrochemical corrosion shall be avoided. | All parts of a tank-container intended for the carriage of liquids having a flash-point of not more than 60 °C, flammable gases, or UN No. 1361 carbon or UN No. 1361 carbon black, packing group II, shall be capable of being electrically earthed. Any metal contact capable of causing electrochemical corrosion shall be avoided. |
|-------------------|--|--|
- 6.8.2.1.28** (Reserved)

**6.8.2.2 Items of equipment**

- 6.8.2.2.1** Suitable non-metallic materials may be used to manufacture service and structural equipment.

The attachments of equipment which is welded on shall be made in such a way that the shell is prevented from being ruptured as a result of stresses caused by an accident. These requirements shall be deemed to be met if point 1.1.10 of UIC leaflet 573<sup>5</sup> (Technical conditions for the construction of tank-wagons) is applied.

The items of equipment shall be so arranged as to be protected against the risk of being wrenched off or damaged during carriage or handling. They shall exhibit a suitable degree of safety comparable to that of the shells themselves, and shall in particular:

- be compatible with the substances carried; and
- meet the requirements of 6.8.2.1.1.

<sup>5</sup> 7<sup>th</sup> edition of the UIC leaflet applicable from 1 October 2008.

Piping shall be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration.

The leakproofness of the service equipment shall be ensured even in the event of the overturning of the tank-wagon or tank-container.

The gaskets shall be made of a material compatible with the substance carried and shall be replaced as soon as their effectiveness is impaired, for example as a result of ageing.

Gaskets ensuring the leakproofness of fittings requiring manipulation during normal use of tanks shall be so designed and arranged that manipulation of the fittings incorporating them does not damage them.

#### 6.8.2.2.2

Each bottom-filling or bottom-discharge opening in tanks which are referred to, in Column (12) of Table A of Chapter 3.2, with a tank code including the letter "A" in its third part (see 4.3.4.1.1) shall be equipped with at least two mutually independent closures, mounted in series, comprising

- an external stop-valve with piping made of a malleable metal material and
- a closing device at the end of each pipe which may be a screw-threaded plug, a blank flange or an equivalent device. This closing device shall be sufficiently tight so that the substance is contained without loss. Measures shall be taken to enable the safe release of pressure in the discharge pipe before the closing device is completely removed.

Each bottom-filling or bottom-discharge opening in tanks which are referred to, in Column (12) of Table A of Chapter 3.2, with a tank code including the letter "B" in its third part (see 4.3.3.1.1 or 4.3.4.1.1) shall be equipped with at least three mutually independent closures, mounted in series, comprising

- an internal stop-valve, i.e. a stop-valve mounted inside the shell or in a welded flange or companion flange;
- an external stop-valve or an equivalent device<sup>6</sup>, | as near as possible to the shell and one at the end of each pipe and
- a closing device at the end of each pipe which may be a screw-threaded plug, a blank flange or an equivalent device. This closing device shall be sufficiently tight so that the substance is contained without loss. Measures shall be taken to enable the safe release of pressure in the discharge pipe before the closing device is completely removed.

However, in the case of tanks intended for the carriage of certain crystallizable or highly viscous substances and shells fitted with an ebonite or thermoplastic coating, the internal stop-valve may be replaced by an external stop-valve provided with additional protection.

The internal stop-valve shall be operable either from above or from below. Its setting – open or closed – shall so far as possible in each case be capable of being verified from the ground. Internal stop-valve control devices shall be so designed as to prevent any unintended opening through impact or an inadvertent act.

The internal shut-off device shall continue to be effective in the event of damage to the external control device.

In order to avoid any loss of contents in the event of damage to the external fittings (pipes, lateral shut-off devices), the internal stop-valve and its seating shall be protected against the danger of being wrenched off by external stresses or shall be so designed as to resist them. The filling and discharge devices (including flanges or threaded plugs) and protective caps (if any) shall be capable of being secured against any unintended opening.

The position and/or direction of closure of shut-off devices shall be clearly apparent.

All openings of tanks which are referred to in Column (12) of Table A of Chapter 3.2, by a tank code including letter "C" or "D" in its third part (see 4.3.3.1.1 and 4.3.4.1.1) shall be situated above the surface level of the liquid. These tanks shall have no pipes or pipe connections below the surface level of the liquid. The cleaning openings (fist-holes) are, however, permitted in the lower part of the shell for tanks referred to by a tank code including letter "C" in its third part. This opening shall be capable of being sealed by a flange so closed as to be leakproof and whose design shall be approved by the competent authority or by a body designated by that authority.

---

<sup>6</sup> In the case of tank-containers of less than 1 m<sup>3</sup> capacity, the external stop-valve or other equivalent device may be replaced by a blank flange.

- 6.8.2.2.3** Tanks that are not hermetically closed may be fitted with vacuum valves or with self-operating ventilation valves to avoid an unacceptable negative internal pressure; these valves shall be set to relieve at a vacuum setting not greater than the vacuum pressure for which the tank has been designed (see 6.8.2.1.7). Hermetically closed tanks shall not be fitted with vacuum valves or with self-operating ventilation valves. However, tanks of the tank code SGAH, S4AH or L4BH, fitted with these valves which open at a negative pressure of not less than 21 kPa (0.21 bar) shall be considered as being hermetically closed. For tanks intended for the carriage of solid substances (powdery or granular) of packing group II or III only, which do not liquefy during transport, the negative pressure may be reduced to not less than 5 kPa (0.05 bar).
- Vacuum valves and self-operating ventilation valves used on tanks intended for the carriage of substances meeting the flash-point criteria of Class 3, shall prevent the immediate passage of flame into the tank, or the shell of the tank shall be capable of withstanding, without leakage, an explosion resulting from the passage of the flame.
- For tanks with self-operating ventilation valves, the connection between the self-operating ventilation valve and the bottom valve shall be so arranged that the valves do not open in the event of deformation of the tank or the contents cannot escape in the event of their opening.
- 6.8.2.2.4** The shell or each of its compartments shall be provided with an opening large enough to permit inspection.
- These openings shall be provided with closures designed for a test pressure of at least 0.4 MPa (4 bar). Hinged dome covers for tanks with a test pressure of more than 0.6 MPa (6 bar) shall not be permitted.
- 6.8.2.2.5** (Reserved)
- 6.8.2.2.6** Tanks intended for the carriage of liquids having a vapour pressure of not more than 110 kPa (1.1 bar) (absolute) at 50 °C shall have a venting system and a safety device to prevent the contents from spilling out if the tank overturns; otherwise they shall conform to 6.8.2.2.7 or 6.8.2.2.8.
- 6.8.2.2.7** Tanks intended for the carriage of liquids having a vapour pressure of more than 110 kPa (1.1 bar) at 50 °C and a boiling point of more than 35 °C shall have a safety valve set at not less than 150 kPa (1.5 bar) (gauge pressure) and which shall be fully open at a pressure not exceeding the test pressure; otherwise they shall conform to 6.8.2.2.8.
- 6.8.2.2.8** Tanks intended for the carriage of liquids having a boiling point of not more than 35 °C shall have a safety valve set at not less than 300 kPa (3 bar) gauge pressure and which shall be fully open at a pressure not exceeding the test pressure; otherwise they shall be hermetically closed<sup>7</sup>.
- 6.8.2.2.9** Movable parts such as covers, closures, etc., which are liable to come into frictional or percussive contact with aluminium shells intended for the carriage of flammable liquids having a flash-point of not more than 60 °C or for the carriage of flammable gases shall not be made of unprotected corrodible steel.
- 6.8.2.2.10** If tanks required to be hermetically closed are equipped with safety valves, these shall be preceded by a bursting disc, and the following conditions shall be observed:
- The arrangement of the bursting disc and the safety valve shall be such as to satisfy the competent authority. A pressure gauge or another suitable indicator shall be provided in the space between the bursting disc and the safety valve, to enable detection of any rupture, perforation or leakage of the disc which may disrupt the action of the safety valve.

<sup>7</sup> For the definition of "hermetically closed tank" see 1.2.1.

**6.8.2.3 Type approval**

**6.8.2.3.1** The competent authority or a body designated by that authority shall issue in respect of each new type of tank-wagon, demountable tank, tank-container, tank swap body, battery-wagon or MEGC a certificate attesting that the type, including fastenings, which it has inspected is suitable for the purpose for which it is intended and meets the construction requirements of 6.8.2.1, the equipment requirements of 6.8.2.2 and the special conditions for the classes of substances carried.

The certificate shall show:

- the results of the test;
- an approval number for the type;

The approval number shall consist of the distinguishing sign<sup>8</sup> of the State in whose territory the approval was granted and a registration number.

- the tank code in accordance with 4.3.3.1.1 or 4.3.4.1.1;
- the alphanumeric codes of special provisions of construction (TC), equipment (TE) and type approval (TA) of 6.8.4 which are shown in column (13) of Table A of Chapter 3.2 for those substances for the carriage of which the tank has been approved;
- if required, the substances and/or group of substances for the carriage of which the tank has been approved.

These shall be shown with their chemical name or the corresponding collective entry (see 2.1.1.2), together with their classification (class, classification code and packing group).

With the exception of substances of Class 2 and those listed in 4.3.4.1.3, the listing of approved substances may be dispensed with. In such cases, groups of substances permitted on the basis of the tank code shown in the rationalised approach in 4.3.4.1.2 shall be accepted for carriage taking into account any relevant special provision.

The substances referred to in the certificate or the groups of substances approved according to the rationalised approach shall, in general, be compatible with the characteristics of the tank. A reservation shall be included in the certificate if it was not possible to investigate this compatibility exhaustively when the type approval was issued.

A copy of the certificate shall be attached to the tank record of each tank, battery-wagon or MEGC constructed (see 4.3.2.1.7).

**6.8.2.3.2** If the tanks, battery-wagons or MEGCs are manufactured in series without modification this approval shall be valid for the tanks, battery-wagons or MEGCs manufactured in series or according to the prototype.

A type approval may however serve for the approval of tanks with limited variations of the design that either reduce the loads and stresses on the tanks (e.g. reduced pressure, reduced mass, reduced volume) or increase the safety of the structure (e.g. increased shell thickness, more surge-plates, decreased diameter of openings). The limited variations shall be clearly described in the type approval certificate.

**6.8.2.4 Inspections and tests**

**6.8.2.4.1** Shells and their equipment shall either together or separately undergo an initial inspection before being put into service. This inspection shall include:

- a check of conformity to the approved type;
- a check of the design characteristics<sup>9</sup>;
- an examination of the internal and external conditions;
- a hydraulic pressure test<sup>10</sup> at the test pressure indicated on the plate prescribed in 6.8.2.5.1; and
- a leakproofness test and a check of satisfactory operation of the equipment.

Except in the case of Class 2, the test pressure for the hydraulic pressure test depends on the calculation pressure and shall be at least equal to the pressure indicated below:

<sup>8</sup> Distinguishing sign for use in international traffic prescribed by the Convention on Road Traffic (Vienna, 1968).

<sup>9</sup> The check of the design characteristics shall also include, for shells requiring a test pressure of 1 MPa (10 bar) or higher, the taking of weld test-pieces (work samples) in accordance with 6.8.2.1.23 and the tests prescribed in 6.8.5.

Calculation pressure (bar)	Test pressure (bar)
G <sup>11</sup>	G <sup>11</sup>
1.5	1.5
2.65	2.65
4	4
10	4
15	4
21	10 (4 <sup>12</sup> )

The minimum test pressures for Class 2 are given in the table of gases and gas mixtures in 4.3.3.2.5.

The hydraulic pressure test shall be carried out on the shell as a whole and separately on each compartment of compartmented shells.

The hydraulic pressure test shall be carried out before the installation of a thermal insulation as may be necessary.

If the shells and their equipment are tested separately, they shall be jointly subjected to a leakproofness test after assembly in accordance with 6.8.2.4.3.

The leakproofness test shall be carried out separately on each compartment of compartmented shells.

**6.8.2.4.2** Shells and their equipment shall undergo periodic inspections **no later than every eight years** **five years**.

These periodic inspections shall include:

- An external and internal examination;
- A leakproofness test in accordance with 6.8.2.4.3 of the shell with its equipment and check of the satisfactory operation of all the equipment;
- As a general rule, a hydraulic pressure test<sup>10</sup> (for the test pressure for the shells and compartments if applicable, see 6.8.2.4.1).

Sheathing for thermal or other insulation shall be removed only to the extent required for reliable appraisal of the characteristics of the shell.

In the case of tanks intended for the carriage of powdery or granular substances, and with the agreement of the expert approved by the competent authority, the periodic hydraulic pressure tests may be omitted and replaced by leakproofness tests in accordance with 6.8.2.4.3, at an effective internal pressure at least equal to the maximum working pressure.

**6.8.2.4.3** Shells and their equipment shall undergo intermediate inspections at least every four years **two and a half years** after the initial inspection and each periodic inspection. These intermediate inspections may be performed within three months before or after the specified date.

However, the intermediate inspection may be performed at any time before the specified date.

If an intermediate inspection is performed more than three months before the due date, another intermediate inspection shall be performed at the latest **four years** **two and a half years** after this date.

These intermediate inspections shall include a leakproofness test of the shell with its equipment and check of the satisfactory operation of all the equipment. For this purpose the tank shall be subjected to an effective internal pressure at least equal to the maximum working pressure. For tanks intended for the carriage of liquids or solids in the granular or powdery state, when a gas is used for the leakproofness test it shall be carried out at a pressure at least equal to 25% of the maximum working pressure. In all cases, it shall not be less than 20 kPa (0.2 bar) (gauge pressure).

For tanks equipped with venting systems and a safety device to prevent the contents spilling out if the tank overturns, the pressure test shall be equal to the static pressure of the filling substance.

<sup>10</sup> In special cases and with the agreement of the expert approved by the competent authority, the hydraulic pressure test may be replaced by a pressure test using another liquid or gas, where such an operation does not present any danger.

<sup>11</sup> G = minimum calculation pressure according to the general requirements of 6.8.2.1.14 (see 4.3.4.1).

<sup>12</sup> Minimum test pressure for UN No. 1744 bromine or UN No. 1744 bromine solution.

The leakproofness test shall be carried out separately on each compartment of compartmented shells.

**6.8.2.4.4** When the safety of the tank or of its equipment may have been impaired as a result of repairs, alterations or accident, an exceptional check shall be carried out. If an exceptional check fulfilling the requirements of 6.8.2.4.2 has been performed, then the exceptional check may be considered to be a periodic inspection. If an exceptional check fulfilling the requirements of 6.8.2.4.3 has been performed then the exceptional check may be considered to be an intermediate inspection.

**6.8.2.4.5** The tests, inspections and checks in accordance with 6.8.2.4.1 to 6.8.2.4.4 shall be carried out by the expert approved by the competent authority. Certificates shall be issued showing the results of these operations, even in the case of negative results. These certificates shall refer to the list of the substances permitted for carriage in this tank or to the tank code and the alphanumeric codes of special provisions in accordance with 6.8.2.3.

A copy of these certificates shall be attached to the tank record of each tank, battery-wagon or MEGC tested (see 4.3.2.1.7).

***Expert for performing tests and inspections on the tanks of tank-wagons***

**6.8.2.4.6** In order to be considered as an expert within the meaning of 6.8.2.4.5, one shall be approved by the competent authority and meet the following requirements. However, this mutual recognition shall not apply to activities in connection with an amendment of the design type approval. (Reserved)

1. The expert shall be independent of the parties involved. He may neither be identical with the originator of the design, the manufacturer, the supplier, the purchaser, the owner, the holder or the user of the tanks of tank-wagons to be inspected, nor may he be an authorized representative of the aforementioned parties.
2. The expert may not engage in any activities that might conflict with his independence of judgement and integrity in relation to the inspection activities. The expert shall, in particular, be free from any commercial, financial or other pressures which might affect his judgement, particularly from persons or undertakings external to the inspection body with an interest in the results of the inspections carried out. The impartiality of the inspection staff shall be ensured.
3. The expert shall have at his disposal the necessary facilities to enable him to perform properly the technical and administrative tasks connected with the examinations and inspection operations. He shall also have access to the equipment required to carry out special inspections.
4. The expert shall have appropriate qualifications, sound technical and vocational training, satisfactory knowledge of the provisions applicable to the inspections to be carried out and adequate practical experience of such operations. In order to ensure a high level of safety, he shall provide expertise in the field of safety of tanks of tank-wagons. He shall be capable of drawing up the necessary certificates, records and reports to demonstrate that the inspections have been carried out.
5. The expert shall be adequately familiar with the technology used for the construction of the tanks to be inspected, including their accessories, the use or intended use of the equipment submitted for inspection, and with the defects which may occur during use or in service.
6. The expert shall carry out the assessments and inspections with the highest degree of profes-

sional reliability and technical competence. He shall ensure the confidentiality of information obtained in the course of the inspection activities. Proprietary rights shall be protected.

7. The amount of remuneration of the expert engaged in inspection activities shall not directly depend on the number of inspections carried out and in no case on the results of such inspections.
8. The expert shall have adequate liability insurance unless, in accordance with national laws and regulations, the liability is assumed by the state or the undertaking of which he forms a part.

These requirements shall be met for:

- the staff of a "notified body" certified in accordance with Directive 1999/36/EC,
- persons who are approved on the basis of an accrediting procedure in accordance with standard EN ISO/IEC 17020:2004 ("General criteria for the operation of various types of bodies performing inspection").

The Member States shall communicate to the secretariat of OTIF the experts who have been approved with respect to the particular inspections. The information shall include the stamp and the marking stamp. The secretariat of OTIF shall publish a list of approved experts and shall ensure that this list is kept up to date.

In order to introduce and to continue to develop harmonised inspection procedures, and in order to ensure a uniform level of inspections, the secretariat of OTIF shall arrange an exchange of experiences at least once every year.

#### 6.8.2.5 Marking

##### 6.8.2.5.1

Every tank shall be fitted with a corrosion-resistant metal plate permanently attached to the tank in a place readily accessible for inspection. The following particulars at least shall be marked on the plate by stamping or by any other similar method. These particulars may be engraved directly on the walls of the shell itself, if the walls are so reinforced that the strength of the shell is not impaired:

- approval number;
- manufacturer's name or mark;
- manufacturer's serial number;
- year of manufacture;
- test pressure (gauge pressure)<sup>13</sup>;
- external design pressure (see 6.8.2.1.7)<sup>13</sup>;
- capacity of the shell<sup>13</sup> – in the case of multiple-compartment shells, the capacity of each compartment<sup>13</sup> – followed by the symbol "S" when the shells or the compartments are divided by surge plates into sections of not more than 7 500 litres capacity;
- design temperature (only if above +50 °C or below –20 °C)<sup>13</sup>;
- date and type of the most recent test: "month, year" followed by a "P" when the test is the initial test or a periodic test in accordance with 6.8.2.4.1 and 6.8.2.4.2, or "month, year" followed by an "L" when the test is an intermediate leakproofness test in accordance with 6.8.2.4.3;
- stamp of the expert who carried out the tests;
- material of the shell and reference to materials standards, if available and, where appropriate, the protective lining.

<sup>13</sup> Add the units of measurement after the numerical values.

In addition, the maximum working pressure<sup>13</sup> allowed shall be inscribed on pressure-filled or pressure-discharge tanks.

**6.8.2.5.2**

The following particulars shall be inscribed on both sides of the tank-wagon itself or on plate:

- name of operator;
- capacity<sup>13</sup>;
- unladen mass of tank-wagon<sup>13</sup>;
- load limits according to the characteristics of the wagon and the nature of the lines used;
- for the substances according to 4.3.4.1.3, the proper shipping name of the substance(s) accepted for carriage;
- tank code according to 4.3.4.1.1;
- for substances other than those according to 4.3.4.1.3, the alphanumeric codes of all special provisions TC and TE which are shown in column (13) of Table A of Chapter 3.2 for the substances to be carried in the tank;
- date (month, year) of the next inspection in accordance with 6.8.2.4.2 and 6.8.2.4.3 or with the TT special provisions of 6.8.4 for the substance(s) accepted for carriage. If the next inspection is an inspection in accordance with 6.8.2.4.3, the date shall be followed by the letter "L".

The following particulars shall be inscribed either on the tank-container itself or on a plate:

- names of owner and of operator;
- capacity of the shell<sup>13</sup>;
- tare<sup>13</sup>;
- maximum permissible laden mass<sup>13</sup>;
- for the substances according to 4.3.4.1.3, the proper shipping name of the substance(s) accepted for carriage;
- tank code according to 4.3.4.1.1;
- for substances other than those according to 4.3.4.1.3, the alphanumeric codes of all special provisions TC and TE which are shown in column (13) of Table A of Chapter 3.2 for the substances to be carried in the tank.

**6.8.2.6****Requirements for tanks which are designed, constructed and tested according to standards**

**NOTE:** Persons or bodies identified in standards as having responsibilities in accordance with RID shall meet the requirements of RID.

Depending on the date of construction of the tank, the standards listed in the Table below shall be applied as indicated in column (4) to meet the requirements of Chapter 6.8 referred to in column (1) or may be applied as indicated in column (5). The requirements of Chapter 6.8 referred to in column (1) shall prevail in all cases.

If more than one standard is listed as mandatory for the application of the same requirements, only one of them shall be applied, but in full unless otherwise specified in the Table below.

Applicable sub-sections and paragraphs	Reference	Title of document	Mandatory application for tanks constructed	Application authorized for tanks constructed
(1)	(2)	(3)	(4)	(5)
<b>For all tanks</b>				
6.8.2.1	EN 14025:2003 + AC:2005	Tanks for the transport of dangerous goods – Metallic pressure tanks – Design and construction		Between 1 January 2005 and 30 June 2009
6.8.2.1	EN 14025:2008	Tanks for the transport of dangerous goods – Metallic pressure tanks – Design and construction	As from 1 July 2009	Before 1 July 2009
6.8.2.2.1	EN 14432:2006	Tanks for the transport of dangerous goods – Tank equipment for the transport of liquid chemicals – Product discharge and air inlet valves	As from 1 January 2011	Before 1 January 2011
6.8.2.2.1	EN 14433:2006	Tanks for transport of dangerous goods – Tank equipment for the transport of liquid chemicals – Foot valves	As from 1 January 2011	Before 1 January 2011

<b>For testing and inspection</b>				
6.8.2.4 6.8.3.4	EN 12972:2001 (with the exception of annexes D and E)	Tanks for transport of dangerous goods – Testing, inspection and marking of metallic tanks	Between 1 January 2009 and 31 December 2010 <sup>(a)</sup>	Between 1 January 2003 and 31 December 2008
6.8.2.4 6.8.3.4	EN 12972:2007	Tanks for transport of dangerous goods – Testing, inspection and marking of metallic tanks	As from 1 January 2011	Before 1 January 2011
<b>For tanks with a maximum working pressure not exceeding 50 kPa and intended for the carriage of substances for which a tank code with the letter "G" is given in column (12) of Table A of Chapter 3.2</b>				
6.8.2.1	EN 13094:2004	Tanks for the transport of dangerous goods – Metallic tanks with a working pressure not exceeding 0.5 bar – Design and construction		As from 1 January 2005
<b>For tanks intended for the carriage of liquid petroleum products and other dangerous substances of Class 3 which have a vapour pressure not exceeding 110 kPa at 50 °C and petrol, and which have no toxic or corrosive subsidiary hazard</b>				
6.8.2.1	EN 13094:2004	Tanks for the transport of dangerous goods – Metallic tanks with a working pressure not exceeding 0.5 bar – Design and construction		As from 1 January 2005

<sup>(a)</sup> Unless the application of another standard is authorized in column (5) for the same purposes for tanks constructed at the same date.

#### 6.8.2.7 Requirements for tanks which are not designed, constructed and tested according to standards

To reflect scientific and technical progress or where no standard is listed in 6.8.2.6 or to deal with specific aspects not addressed in a standard listed in 6.8.2.6, the competent authority may recognize the use of a technical code providing the same level of safety. Tanks shall, however, comply with the minimum requirements of 6.8.2.

The competent authority shall transmit to the secretariat of OTIF a list of the technical codes that it recognises. The list should include the following details: name and date of the code, purpose of the code and details of where it may be obtained. The secretariat shall make this information publicly available on its website.

For testing, inspection and marking, the applicable standard as referred to in 6.8.2.6 may also be used.

#### 6.8.3 Special requirements applicable to Class 2

##### 6.8.3.1 Construction of shells

##### 6.8.3.1.1 Shells intended for the carriage of compressed or liquefied gases or dissolved gases shall be made of steel.

In the case of weldless shells, by derogation from 6.8.2.1.12 a minimum elongation at fracture of 14% and also a stress  $\sigma$  lower than or equal to limits hereafter given according to the material may be accepted:

- (a) When the ratio  $Re/R_m$  (of the minimum guaranteed characteristics after heat treatment) is higher than 0.66 without exceeding 0.85:  $\sigma \leq 0.75 Re$ .
- (b) When the ratio  $Re/R_m$  (of the minimum guaranteed characteristics after heat treatment) is higher than 0.85:  $\sigma \leq 0.5 R_m$ .

##### 6.8.3.1.2 The requirements of 6.8.5 apply to the materials and construction of welded shells.

##### 6.8.3.1.3 For double-walled shells, the wall thickness of the inner receptacle may, notwithstanding the requirements of 6.8.2.1.18, be 3 mm if a metal is used which has good low-temperature performance corresponding to a minimum tensile strength $R_m = 490 \text{ N/mm}^2$ and a minimum coefficient of elongation $A = 30\%$ .

If other metals are used, an equivalent minimum wall thickness shall be maintained; this thickness is to be calculated according to the formula in foot-

(Reserved)

note 4 to 6.8.2.1.18, where  $R_{m0} = 490 \text{ N/mm}^2$  and  $A_0 = 30\%$ .

The outer shell shall in this case have a minimum wall thickness of 6 mm where mild steel is concerned. If other materials are used, an equivalent minimum wall thickness shall be maintained, which shall be calculated according to the formula given in 6.8.2.1.18.

#### Construction of battery-wagons and MEGCs

**6.8.3.1.4** Cylinders, tubes, pressure drums and bundles of cylinders, as elements of a battery-wagon or MEGC, shall be constructed in accordance with Chapter 6.2.

**NOTE 1:** Bundles of cylinders which are not elements of a battery-wagon or of a MEGC shall be subject to the requirements of Chapter 6.2.

**2:** Tanks as elements of battery-wagons and MEGCs shall be constructed in accordance with 6.8.2.1 and 6.8.3.1.

**3:** Demountable tanks<sup>14</sup> are not to be considered elements of battery-vehicles or MEGCs.

**6.8.3.1.5** Elements and their fastenings shall be capable of absorbing under the maximum permissible load the forces defined in 6.8.2.1.2. Under each force the stress at the most severely stressed point of the element and its fastenings shall not exceed the value defined in 6.2.5.3 for cylinders, tubes, pressure drums and bundles of cylinders and for tanks the value of  $\sigma$  defined in 6.8.2.1.16.

#### Other provisions for the construction of tank-wagons and battery-wagons

**6.8.3.1.6** Tank-wagons and battery-wagons shall be fitted with buffers with a minimum energy absorption capacity of 70 kJ. This provision does not apply to tank-wagons and battery-wagons fitted with energy absorption elements in accordance with the definition in 6.8.4, special provision TE 22. (Reserved)

#### 6.8.3.2 Items of equipment

**6.8.3.2.1** The discharge pipes of tanks shall be capable of being closed by blank flanges or some other equally reliable device. For tanks intended for the carriage of refrigerated liquefied gases, these blank flanges or other equally reliable devices may be fitted with pressure-release openings of a maximum diameter of 1.5 mm.

**6.8.3.2.2** Shells intended for the carriage of liquefied gases may be provided with, in addition to the openings prescribed in 6.8.2.2.2 and 6.8.2.2.4, openings for the fitting of gauges, thermometers, manometers and with bleed holes, as required for their operation and safety.

**6.8.3.2.3** All filling and all discharge openings of tanks intended for the carriage of liquefied flammable and/or toxic gases shall be equipped with an instant-closing internal safety device which closes automatically in the event of an unintended movement of the shell or of fire. It shall also be possible to operate the closing device by remote control. with a capacity greater than  $1 \text{ m}^3$

The device which keeps the internal closure open, e.g. a rail hook, is not a component of the wagon.

**6.8.3.2.4** All openings, other than those accommodating safety valves and closed bleed holes, of tanks intended for the carriage of liquefied flammable and/or toxic gases shall, if their nominal diameter is more than 1.5 mm, shall be equipped with an internal shut-off device.

**6.8.3.2.5** Notwithstanding the requirements of 6.8.2.2.2, 6.8.3.2.3 and 6.8.3.2.4, tanks intended for the carriage of refrigerated liquefied gases may be equipped with external devices in place of internal devices if the external devices afford protection against external damage at least equivalent to that afforded by the wall of the shell.

<sup>14</sup> For the definition of "demountable tank" see 1.2.1.

- 6.8.3.2.6** If the tanks are equipped with gauges in direct contact with the substance carried, the gauges shall not be made of a transparent material. If there are thermometers, they shall not project directly into the gas or liquid through the shell.
- 6.8.3.2.7** Filling and discharge openings situated in the upper part of tanks shall be equipped with, in addition to what is prescribed in 6.8.3.2.3, a second, external, closing device. This device shall be capable of being closed by a blank flange or some other equally reliable device.
- 6.8.3.2.8** Safety valves shall meet the requirements of 6.8.3.2.9 to 6.8.3.2.12 below:
- 6.8.3.2.9** Tanks intended for the carriage of compressed or liquefied gases or dissolved gases, may be fitted with spring-loaded safety valves. These valves shall be capable of opening automatically under a pressure between 0.9 and 1.0 times the test pressure of the tank to which they are fitted. They shall be of such a type as to resist dynamic stresses, including liquid surge. The use of dead weight or counter weight valves is prohibited. The required capacity of the safety valves shall be calculated in accordance with the formula contained in 6.7.3.8.1.1.
- 6.8.3.2.10** Where tanks are intended for carriage by sea, the requirements of 6.8.3.2.9 shall not prohibit the fitting of safety valves conforming to the IMDG Code.
- 6.8.3.2.11** Tanks intended for the carriage of refrigerated liquefied gases shall be equipped with two or more independent safety valves capable of opening at the maximum working pressure indicated on the tank. Two of these safety valves shall be individually sized to allow the gases formed by evaporation during normal operation to escape from the tank in such a way that the pressure does not at any time exceed by more than 10% the working pressure indicated on the tank.

One of the safety valves may be replaced by a bursting disc which shall be such as to burst at the test pressure.

In the event of loss of the vacuum in a double-walled tank, or of destruction of 20% of the insulation of a single-walled tank, the combination of the pressure relief devices shall permit an outflow such that the pressure in the shell cannot exceed the test pressure. **The provisions of 6.8.2.1.7 shall not apply to vacuum-insulated tanks.**

- 6.8.3.2.12** These pressure relief devices of tanks intended for the carriage of refrigerated liquefied gases shall be so designed as to function faultlessly even at their lowest working temperature. The reliability of their operation at that temperature shall be established and checked either by testing each device or by testing a specimen device of each design-type.
- 6.8.3.2.13** For demountable elements<sup>14</sup> the following requirements shall apply:
- |   |            |
|---|------------|
| <ul style="list-style-type: none"> <li>(a) if they can be rolled, the valves shall be provided with protective caps;</li> <li>(b) they shall be so fixed on the underframe of the wagon that they cannot move.</li> </ul> | (Reserved) |
|---|------------|

#### Thermal insulation

- 6.8.3.2.14** If tanks intended for the carriage of liquefied gases are equipped with thermal insulation, such insulation shall consist of either:
- a sun shield covering not less than the upper third but not more than the upper half of the tank surface and separated from the shell by an air space at least 4 cm across; or
  - a complete cladding, of adequate thickness, of insulating materials.
- 6.8.3.2.15** Tanks intended for the carriage of refrigerated liquefied gases shall be thermally insulated. Thermal insulation shall be ensured by means of a continuous sheathing. If the space between the shell and the sheathing is under vacuum (vacuum insulation), the protective sheathing shall be so designed as to withstand without deformation an external pressure of at least 100 kPa (1 bar) (gauge pressure). By derogation from the definition of "calculation pressure" in 1.2.1, external and internal reinforcing devices may be taken into account in the calculations. If the sheathing is so closed as to be gas-tight, a device shall be provided to prevent any dangerous pressure from developing in the insulating layer in the event of inadequate gas-tightness of the shell or of its items of equipment. The device shall prevent the infiltration of moisture into the heat-insulating sheath.
- 6.8.3.2.16** Tanks intended for the carriage of liquefied gases having a boiling point below –182 °C at atmospheric pressure shall not include any combustible material either in the thermal insulation or in the means of attachment.

The means of attachment for vacuum insulated tanks may, with the approval of the competent authority, contain plastics substances between the shell and the sheathing.

- 6.8.3.2.17** By derogation from the requirements of 6.8.2.2.4 shells intended for the carriage of refrigerated liquefied gases need not have an inspection opening.

**Items of equipment for battery-wagons and MEGCs**

- 6.8.3.2.18** Service and structural equipment shall be configured or designed to prevent damage that could result in the release of the pressure receptacle contents during normal conditions of handling and carriage. When the connection between the frame of the battery-wagon or MEGC and the elements allows relative movement between the sub-assemblies, the equipment shall be so fastened as to permit such movement without damage to working parts. Manifold piping leading to shut-off valves shall be sufficiently flexible to protect the valves and the piping from shearing, or releasing the pressure receptacle contents. The filling and discharge devices (including flanges or threaded plugs) and any protective caps shall be capable of being secured against unintended opening.

- 6.8.3.2.19** In order to avoid any loss of content in the event of damage, the manifolds, the discharge fittings (pipe sockets, shut-off devices), and the stop-valves shall be protected or arranged from being wrenched off by external forces or designed to withstand them.

- 6.8.3.2.20** The manifold shall be designed for service in a temperature range of  $-20\text{ }^{\circ}\text{C}$  to  $+50\text{ }^{\circ}\text{C}$ .

The manifold shall be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration. All piping shall be of suitable metallic material. Welded pipe joints shall be used wherever possible.

Joints in copper tubing shall be brazed or have an equally strong metal union. The melting point of brazing materials shall be no lower than  $525\text{ }^{\circ}\text{C}$ . The joints shall not decrease the strength of tubing as may happen when cutting threads.

- 6.8.3.2.21** Except for UN No. 1001 acetylene, dissolved, the permissible maximum stress  $\sigma$  of the manifolding arrangement at the test pressure of the receptacles shall not exceed 75% of the guaranteed yield strength of the material.

The necessary wall thickness of the manifolding arrangement for the carriage of UN No. 1001 acetylene, dissolved shall be calculated according to an approved code of practice.

**NOTE:** For the yield strength, see 6.8.2.1.11.

The basic requirements of this paragraph shall be deemed to have been complied with if the following standards are applied:

(Reserved)

- 6.8.3.2.22** By derogation from the requirements of 6.8.3.2.3, 6.8.3.2.4 and 6.8.3.2.7, for cylinders, tubes, pressure drums and bundles of cylinders (frames) forming a battery-wagon or MEGC, the required closing devices may be provided for within the manifolding arrangement.

- 6.8.3.2.23** If one of the elements is equipped with a safety valve and shut-off devices are provided between the elements, every element shall be so equipped.

- 6.8.3.2.24** The filling and discharge devices may be affixed to a manifold.

- 6.8.3.2.25** Each element, including each individual cylinder of a bundle, intended for the carriage of toxic gases, shall be capable of being isolated by a shut-off valve.

- 6.8.3.2.26** Battery-wagons or MEGCs intended for the carriage of toxic gases shall not have safety valves, unless the safety valves are preceded by a bursting disc. In the latter case, the arrangement of the bursting disc and safety valve shall be satisfactory to the competent authority.

- 6.8.3.2.27** When battery-wagons or MEGCs are intended for carriage by sea, the requirements of 6.8.3.2.26 shall not prohibit the fitting of safety valves conforming to the IMDG Code.

- 6.8.3.2.28** Receptacles which are elements of a battery-wagon or MEGC intended for the carriage of flammable gases shall be combined in groups of not more than 5 000 litres which are capable of being isolated by a shut-off valve.

Each element of a battery-wagon or MEGC intended for the carriage of flammable gases, when consisting of tanks conforming to this Chapter, shall be capable of being isolated by a shut-off valve.

**6.8.3.3 Type approval**

No special requirements.

**6.8.3.4 Inspections and tests**

**6.8.3.4.1** The materials of every welded shell with the exception of cylinders, tubes, pressure drums and cylinders as part of bundles of cylinders which are elements of a battery-wagon or of a MEGC shall be tested according to the method described in 6.8.5.

**6.8.3.4.2** The basic requirements for the test pressure are given in 4.3.3.2.1 to 4.3.3.2.4 and the minimum test pressures are given in the table of gases and gas mixtures in 4.3.3.2.5.

**6.8.3.4.3** The first hydraulic pressure test shall be carried out before thermal insulation is placed in position. When the shell, its fittings, piping and items of equipment have been tested separately, the tank shall be subjected to a leakproofness test after assembly.

**6.8.3.4.4** The capacity of each shell intended for the carriage of compressed gases filled by mass, liquefied gases or dissolved gases shall be determined, under the supervision of an expert approved by the competent authority, by weighing or volumetric measurement of the quantity of water which fills the shell; the measurement of shell capacity shall be accurate to within 1%. Determination by a calculation based on the dimensions of the shell is not permitted. The maximum filling masses allowed in accordance with packing instruction P200 or P203 in 4.1.4.1 as well as 4.3.3.2.2 and 4.3.3.2.3 shall be prescribed by an approved expert.

**6.8.3.4.5** Checking of the welds shall be carried out in accordance with the  $\lambda=1$  requirements of 6.8.2.1.23.

**6.8.3.4.6** By derogation from the requirements of 6.8.2.4, the periodic inspections according to 6.8.2.4.2, shall take place:

- (a) at least every four years in the case of tanks intended for the carriage of UN No. 1008 boron trifluoride, UN No. 1017 chlorine, UN No. 1048 hydrogen bromide, anhydrous, UN No. 1050 hydrogen chloride, anhydrous, UN No. 1053 hydrogen sulphide or UN No. 1079 sulphur dioxide; at least every two and a half years
- (b) at least after eight years of service and thereafter at least every 12 years in the case of tanks intended for the carriage of refrigerated liquefied gases.

The intermediate inspections according to 6.8.2.4.3 shall be carried out at least six years after each periodic inspection. A leakproofness test or an intermediate inspection according to 6.8.2.4.3 may be performed, at the request of the competent authority, between any two successive periodic inspections.

When the shell, its fittings, piping and items of equipment have been tested separately, the tank shall be subjected to a leakproofness test after assembly.

**6.8.3.4.7** In the case of vacuum-insulated tanks, the hydraulic-pressure test and the check of the internal condition may, with the consent of the approved expert, be replaced by a leakproofness test and measurement of the vacuum.

**6.8.3.4.8** If, at the time of periodic inspections, openings have been made in shells intended for the carriage of refrigerated liquefied gases, the method by which they are hermetically closed before the shells are returned to service shall be approved by the approved expert and shall ensure the integrity of the shell.

**6.8.3.4.9** Leakproofness tests of tanks intended for the carriage of gases shall be performed at a pressure of not less than:

- For compressed gases, liquefied gases and dissolved gases: 20% of the test pressure;
- For refrigerated liquefied gases: 90% of the maximum working pressure.

**Inspections and tests for battery-wagons and MEGCs**

**6.8.3.4.10** The elements and items of equipment of each battery-wagon or MEGC shall be inspected and tested either together or separately before being put into service for the first time (initial inspection and test). Thereafter battery-wagons or MEGCs the elements of which are receptacles shall be inspected at not more than five-year intervals. Battery-wagons and MEGCs the elements of which are tanks shall be inspected according to 6.8.3.4.6. An exceptional inspection and test shall be performed regardless of the last periodic inspection and test when necessary according to 6.8.3.4.14.

**6.8.3.4.11** The initial inspection shall include:

- a check of conformity to the approved type;
- a check of the design characteristics;
- an examination of the internal and external conditions;

- a hydraulic pressure test<sup>15</sup> at the test pressure indicated on the plate prescribed in 6.8.3.5.10;
- a leakproofness test at the maximum working pressure; and
- a check of satisfactory operation of the equipment.

When the elements and their fittings have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.

- 6.8.3.4.12** Cylinders, tubes and pressure drums and cylinders as part of bundles of cylinders shall be tested according to packing instruction P200 or P203 in 4.1.4.1.

The test pressure of the manifold of the battery-wagon or MEGC shall be the same as that of the elements of the battery-wagon or MEGC. The pressure test of the manifold may be performed as a hydraulic test or by using another liquid or gas with the agreement of the competent authority or its authorised body. By derogation from this requirement, the test pressure for the manifold of battery-wagon or MEGC shall not be less than 300 bar for UN No. 1001 acetylene, dissolved.

- 6.8.3.4.13** The periodic inspection shall include a leakproofness test at the maximum working pressure and an external examination of the structure, the elements and the service equipment without disassembling. The elements and the piping shall be tested at the periodicity defined in packing instruction P200 of 4.1.4.1 and in accordance with the requirements of 6.2.1.6 and 6.2.3.5 respectively. When the elements and equipment have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.

- 6.8.3.4.14** An exceptional inspection and test is necessary when the battery-wagon or MEGC shows evidence of damaged or corroded areas, or leakage, or any other conditions, that indicate a deficiency that could affect the integrity of the battery-wagon or MEGC. The extent of the exceptional inspection and test and, if deemed necessary, the disassembling of elements shall depend on the amount of damage or deterioration of the battery-wagon or MEGC. It shall include at least the examinations required under 6.8.3.4.15.

- 6.8.3.4.15** The examinations shall ensure that:

- (a) the elements are inspected externally for pitting, corrosion, or abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the battery-wagons or MEGCs unsafe for transport;
- (b) the piping, valves, and gaskets are inspected for corroded areas, defects, and other conditions, including leakage, that might render battery-wagons or MEGCs unsafe for filling, discharge or transport;
- (c) missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
- (d) all emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves shall be operated to demonstrate proper operation;
- (e) required markings on the battery-wagons or MEGCs are legible and in accordance with the applicable requirements; and
- (f) any framework, supports and arrangements for lifting the battery-wagons or MEGCs are in satisfactory condition.

- 6.8.3.4.16** The tests, inspections and checks in accordance with 6.8.3.4.10 to 6.8.3.4.15 shall be carried out by the expert approved by the competent authority. Certificates shall be issued showing the results of these operations, even in the case of negative results. These certificates shall refer to the list of the substances permitted for carriage in this battery-wagon or MEGC in accordance with 6.8.2.3.1.

A copy of these certificates shall be attached to the tank record of each tank, battery-wagon or MEGC tested (see 4.3.2.1.7).

### **6.8.3.5 Marking**

- 6.8.3.5.1** The following additional particulars shall be marked by stamping or by any other similar method on the plate prescribed in 6.8.2.5.1, or directly on the walls of the shell itself if the walls are so reinforced that the strength of the tank is not impaired.

- 6.8.3.5.2** On tanks intended for the carriage of only one substance:

- the proper shipping name of the gas and, in addition for gases classified under an n.o.s. entry, the technical name<sup>16</sup>.

---

<sup>15</sup> In special cases and with the agreement of the expert approved by the competent authority, the hydraulic pressure test may be replaced by a pressure test using another liquid or gas, where such an operation does not present any danger.

This indication shall be supplemented:

- in the case of tanks intended for the carriage of compressed gases filled by volume (pressure), by an indication of the maximum filling pressure at 15 °C permitted for the tank; and
- in the case of tanks intended for the carriage of compressed gases filled by mass, and of liquefied gases, refrigerated liquefied gases or dissolved gases by an indication of the maximum permissible load mass in kg and of the filling temperature if below –20 °C.

**6.8.3.5.3** On multipurpose tanks:

- the proper shipping names of the gases and, in addition for gases classified under an n.o.s. entry, the technical name of the gases<sup>16</sup> for whose carriage the tank is approved.

These particulars shall be supplemented by an indication of the maximum permissible load mass in kg for each gas.

**6.8.3.5.4** On tanks intended for the carriage of refrigerated liquefied gases:

- the maximum working pressure allowed.

**6.8.3.5.5** On tanks equipped with thermal insulation:

- the inscription "thermally insulated" or "thermally insulated by vacuum".

**6.8.3.5.6** In addition to the particulars prescribed in 6.8.2.5.2, the following shall be inscribed on both sides of the tank-wagon or on plates: | the tank-container itself or on a plate:

- (a) – the tank code according to the certificate (see 6.8.2.3.1) with the actual test pressure of the tank;
  - the inscription: "minimum filling temperature allowed :...";
- (b) where the tank is intended for the carriage of one substance only:
  - the proper shipping name of the gas and, in addition for gases classified under an n.o.s. entry, the technical name<sup>16</sup>;

– for compressed gases which are filled by mass, and for liquefied gases, refrigerated liquefied gases or dissolved gases, the maximum permissible load mass in kg;

(c) where the tank is a multipurpose tank:

- the proper shipping name of the gas and, for gases classified under an n.o.s. entry, the technical name<sup>16</sup> of all gases to whose carriage the tank is assigned

with an indication of the maximum permissible load mass in kg for each of them;

(d) where the shell is equipped with thermal insulation:

- the inscription "thermally insulated" (or "thermally insulated by vacuum"), in an official language of the country of registration and also, if that language is not English, French, German or Italian, in English, French, German or Italian, unless any agreements concluded between the countries concerned in the transport operation provide otherwise

**6.8.3.5.7** The load limits in accordance with 6.8.2.5.2

(Reserved)

- for compressed gases filled by mass,
- for liquefied or refrigerated, liquefied gases and
- for dissolved gases,

shall be determined in the light of the maximum permissible load mass of the shell, depending on the substance carried; in the case of multi-purpose

<sup>16</sup> Instead of the proper shipping name or, if applicable, of the proper shipping name of the n.o.s. entry followed by the technical name, the use of the following names is permitted:

- for UN No. 1078 refrigerant gas, n.o.s: mixture F1, mixture F2, mixture F3;
- for UN No. 1060 methylacetylene and propadiene mixtures, stabilized: mixture P1, mixture P2;
- for UN No. 1965 hydrocarbon gas mixture, liquefied, n.o.s: mixture A, mixture A01, mixture A02, mixture A0, mixture A1, mixture B1, mixture B2, mixture B, mixture C. The names customary in the trade and mentioned in 2.2.2.3, Classification code 2F, UN No. 1965, Note 1 may be used only as a complement;
- for UN No. 1010 Butadienes, stabilized: 1,2-Butadiene, stabilized, 1,3-Butadiene, stabilized.

shells, the name in full of the particular gas being carried shall be stated together with the load limit on the same moveable panel. The folding panels shall be designed and be capable of being secured so that they cannot unfold or become loose from the frame during carriage (especially as a result of impacts or unintentional actions).

**6.8.3.5.8** The panels on wagons carrying demountable tanks as referred to in 6.8.3.2.13 need not bear the particulars prescribed in 6.8.2.5.2 and 6.8.3.5.6. (Reserved)

**6.8.3.5.9** (Reserved)

#### Marking of battery-wagons and MEGCs

**6.8.3.5.10** Every battery-wagon and every MEGC shall be fitted with a corrosion-resistant metal plate permanently attached in a place readily accessible for inspection. The following particulars at least shall be marked on the plate by stamping or by any other similar method:

- approval number;
- manufacturer's name or mark;
- manufacturer's serial number;
- year of manufacture;
- test pressure (gauge pressure)<sup>17</sup>;
- design temperature (only if above +50 °C or below –20 °C)<sup>17</sup>;
- date (month and year) of initial test and most recent periodic test in accordance with 6.8.3.4.10 to 6.8.3.4.13;
- stamp of the expert who carried out the tests.

**6.8.3.5.11** The following particulars shall be inscribed on both sides of the battery-wagon on a plate:

- name of operator;
- number of elements;
- total capacity of the elements<sup>17</sup>;
- load limits according to the characteristics of the wagon and the nature of the lines used;
- tank code according to the certificate (see 6.8.2.3.1) with the relevant test pressure for the battery-wagon;
- proper shipping name and, in addition, for gases covered by an n.o.s. entry, the technical name<sup>16</sup> of the gas the transport of which the battery-wagon is used;
- the date (month, year) of the next test in accordance with 6.8.2.4.3 and 6.8.3.4.13.

The following particulars shall be inscribed either on the MEGC itself or on a plate:

- names of owner and of operator;
- number of elements;
- total capacity of the elements<sup>17</sup>;
- maximum permissible laden mass<sup>17</sup>;
- tank code according to the certificate (see 6.8.2.3.1) with the relevant test pressure for the MEGC;
- proper shipping name and, in addition, for gases covered by an n.o.s. entry, the technical name<sup>16</sup> of the gas the transport of which the MEGC is used;

and for MEGCs filled by mass:

- tare<sup>17</sup>.

**6.8.3.5.12** The frame of a battery-wagon or MEGC shall bear near the filling point a plate specifying:

- the maximum filling pressure<sup>17</sup> at 15 °C allowed for elements intended for compressed gases;
- the proper shipping name of the gas in accordance with Chapter 3.2 and, in addition for gases classified under an n.o.s. entry, the technical name<sup>16</sup>;

and, in addition, in the case of liquefied gases:

- the permissible maximum load per element<sup>17</sup>.

**6.8.3.5.13** Cylinders, tubes and pressure drums, and cylinders as part of bundles of cylinders, shall be marked according to 6.2.2.7. These receptacles need not be labelled individually with the danger labels as required in Chapter 5.2.

Battery-wagons and MEGCs shall be placarded and marked according to Chapter 5.3.

<sup>17</sup> Add the units of measurements after the numerical values.

**6.8.3.6 Requirements for battery-wagons and MEGCs which are designed, constructed and tested according to standards**

(Reserved)

**6.8.3.7 Requirements for battery-wagons and MEGCs which are not designed, constructed and tested according to standards**

Battery-wagons and MEGCs which are not designed, constructed and tested in accordance with the standards set out in 6.8.3.6 shall be designed, constructed and tested in accordance with the requirements of a technical code recognized by the competent authority. They shall, however, comply with the minimum requirements of 6.8.3.

**6.8.4 Special provisions**

**NOTE 1:** For liquids having a flash-point of not more than 60 °C and for flammable gases, see also 6.8.2.1.26, 6.8.2.1.27 and 6.8.2.2.9.

**2:** For requirements for tanks subjected to a pressure test of not less than 1 MPa (10 bar) or for tanks intended for the carriage of refrigerated liquefied gases, see 6.8.5.

When they are shown under an entry in Column (13) of Table A of Chapter 3.2, the following special provisions apply:

**(a) Construction (TC)**

**TC 1** The requirements of 6.8.5 are applicable to the materials and construction of these shells.

**TC 2** Shells, and their items of equipment, shall be made of aluminium not less than 99.5% pure or of suitable steel not liable to cause hydrogen peroxide to decompose. Where shells are made of aluminium not less than 99.5% pure, the wall thickness need not exceed 15 mm, even where calculation in accordance with 6.8.2.1.17 gives a higher value.

**TC 3** The shells shall be made of austenitic steel.

**TC 4** Shells shall be provided with an enamel or equivalent protective lining if the material of the shell is attacked by UN No. 3250 chloroacetic acid.

**TC 5** Shells shall be provided with a lead lining not less than 5 mm thick or an equivalent lining.

**TC 6** Where the use of aluminium is necessary for tanks, such tanks shall be made of aluminium not less than 99.5% pure; the wall thickness need not exceed 15 mm even where calculation in accordance with 6.8.2.1.17 gives a higher value.

**TC 7** (Reserved)

**(b) Items of equipment (TE)**

**TE 1** (Deleted)

**TE 2** (Deleted)

**TE 3** Tanks shall in addition meet the following requirements.

The heating device shall not penetrate into, but shall be exterior to the shell. However, a pipe used for extracting the phosphorus may be equipped with a heating jacket. The device heating the jacket shall be so regulated as to prevent the temperature of the phosphorus from exceeding the filling temperature of the shell. Other piping shall enter the shell in its upper part; openings shall be situated above the highest permissible level of the phosphorus and be capable of being completely enclosed under lockable caps.

The tank shall be equipped with a gauging system for verifying the level of the phosphorus and, if water is used as a protective agent, with a fixed gauge mark showing the highest permissible level of the water.

**TE 4** Shells shall be equipped with thermal insulation made of materials which are not readily flammable.

**TE 5** If shells are equipped with thermal insulation, such insulation shall be made of materials which are not readily flammable.

**TE 6** Tanks may be equipped with a device of a design which precludes its obstruction by the substance carried and which prevents leakage and the build-up of excess overpressure or underpressure inside the shell.

- TE 7** The shell-discharge system shall be equipped with two mutually independent shut-off devices mounted in series, the first taking the form of a quick-closing internal stop-valve of an approved type and the second that of an external stop-valve, one at each end of the discharge pipe. A blank flange, or another device providing the same measure of security, shall also be fitted at the outlet of each external stop-valve. The internal stop-valve shall be such that if the pipe is wrenched off the stop-valve will remain integral with the shell and in the closed position.
- TE 8** The connections to the external pipe-sockets of tanks shall be made of materials not liable to cause decomposition of hydrogen peroxide.
- TE 9** Tanks shall be fitted in their upper part with a shut-off device preventing any build-up of excess pressure inside the shell due to the decomposition of the substances carried, any leakage of liquid, and any entry of foreign matter into the shell.
- TE 10** The shut-off devices of tanks shall be so designed as to preclude obstruction of the devices by solidified substance during carriage.
- Where tanks are sheathed in thermally-insulating material, the material shall be of an inorganic nature and entirely free from combustible matter.
- TE 11** Shells and their service equipment shall be so designed as to prevent the entry of foreign matter, leakage of liquid or any building up of dangerous excess pressure inside the shell due to the decomposition of the substances carried. A safety valve preventing the entry of foreign matter also fulfils this provision.
- TE 12** Tanks shall be equipped with thermal insulation complying with the requirements of 6.8.3.2.14. The sun shield and any part of the tank not covered by it, or the outer sheathing of a complete lagging, shall be painted white or finished in bright metal. The paint shall be cleaned before each transport journey and renewed in case of yellowing or deterioration. The thermal insulation shall be free from combustible matter.

Tanks shall be fitted with temperature sensing devices.

Tanks shall be fitted with safety valves and emergency pressure-relief devices. Vacuum-relief devices may also be used. Emergency pressure-relief devices shall operate at pressures determined according to both the properties of the organic peroxide and the construction characteristics of the tank. Fusible elements shall not be permitted in the body of the shell.

Tanks shall be fitted with spring-loaded safety valves to prevent significant pressure build-up within the shell of the decomposition products and vapours released at a temperature of 50 °C. The capacity and start-to-discharge pressure of the safety-valve(s) shall be based on the results of the tests specified in special provision TA2. The start-to-discharge pressure shall however in no case be such that liquid could escape from the valve(s) if the tank were overturned.

The emergency-relief devices may be of the spring-loaded or frangible types designed to vent all the decomposition products and vapours evolved during a period of not less than one hour of complete fire-engulfment as calculated by the following formula:

$$q = 70961 \cdot F \cdot A^{0.82}$$

where:

q = heat absorption [W]

A = wetted area [m<sup>2</sup>]

F = insulation factor [-]

F = 1 for non-insulated tanks, or

$$F = \frac{U (923 - T_{PO})}{47032} \text{ for insulated tanks}$$

where:

K = heat conductivity of insulation layer [W·m<sup>-1</sup>·K<sup>-1</sup>]

L = thickness of insulation layer [m]

U = K/L = heat transfer coefficient of the insulation [W·m<sup>-2</sup>·K<sup>-1</sup>]

T<sub>PO</sub> = temperature of peroxide at relieving conditions [K].

The start-to-discharge pressure of the emergency-relief device(s) shall be higher than that above specified and based on the results of the tests referred to in special provision TA2. The emergency-relief devices shall be dimensioned in such a way that the maximum pressure in the tank never exceeds the test pressure of the tank.

**NOTE:** An example of a method to determine the size of emergency-relief devices is given in Appendix 5 of the Manual of Tests and Criteria.

For tanks equipped with thermal insulation consisting of a complete cladding, the capacity and setting of the emergency-relief device(s) shall be determined assuming a loss of insulation from 1% of the surface area.

Vacuum-relief devices and spring-loaded safety valves of tanks shall be provided with flame arresters unless the substances to be carried and their decomposition products are non-combustible. Due attention shall be paid to the reduction of the relief capacity caused by the flame arrester.

TE 13	Tanks shall be thermally insulated and fitted with a heating device on the outside.	
TE 14	Tanks shall be equipped with thermal insulation. The thermal insulation directly in contact with the shell shall have an ignition temperature at least 50 °C higher than the maximum temperature for which the tank was designed.	
TE 15	(Deleted)	
TE 16	No part of the tank-wagon may be of wood, unless this is protected by a suitable coating.	(Reserved)
TE 17	For demountable tanks <sup>18</sup> , the following requirements apply: (a) they shall be so fixed on the underframe of the wagon that they cannot move; (b) they shall not be interconnected by a manifold; (c) if they can be rolled, the valves shall be provided with protective caps.	(Reserved)
TE 18	(Reserved)	
TE 19	(Reserved)	
TE 20	Notwithstanding the other tank-codes which are permitted in the hierarchy of tanks of the rationalized approach in 4.3.4.1.2, tanks shall be equipped with a safety valve.	
TE 21	The closures shall be protected with lockable caps.	
TE 22	<p>In order to reduce the extent of damage in the event of a collision shock or accident, each end of tank-wagons for substances carried in the liquid state and gases or battery-wagons shall be capable of absorbing at least 800 kJ of energy by means of elastic or plastic deformation of defined components of the subframe or by means of a similar procedure (e.g. crash elements). The energy absorption shall be determined in relation to a collision on a straight track.</p> <p>Energy absorption by means of plastic deformation shall only occur in conditions other than those encountered during normal conditions of rail transport (impact speed higher than 12 km/h or individual buffer force greater than 1500 kN).</p> <p>Energy absorption of not more than 800 kJ at each end of the wagon shall not lead to transfer of energy to the shell which could cause visible, permanent deformation of the shell.</p> <p>The requirements of this special provision are considered to have been complied with if Sections 1.4 and 1.1.6 of UIC leaflet 573<sup>19</sup> (Technical conditions for the construction of tank wagons) are applied.</p>	(Reserved)

<sup>18</sup> For the definition of "demountable tank", see 1.2.1.

<sup>19</sup> 7<sup>th</sup> Edition of the UIC leaflet applicable from 1 October 2008.

**TE 23** Tanks shall be equipped with a device of a design which precludes its obstruction by the substance carried and which prevents leakage and the build-up of excess overpressure or underpressure inside the shell.

**TE 24** (Deleted)

**TE 25** Shells of tank-wagons shall also be protected against the overriding of buffers and derailment or, failing that, to limit damage when buffers override by at least one of the following measures. (Reserved)

Measures to avoid overriding

(a) Device to protect against the overriding of buffers

The device to protect against the overriding of buffers shall ensure that the sub-frames of the wagons remain on the same horizontal level. The following requirements shall be fulfilled:

- The device to protect against the overriding of buffers shall not interfere with the normal operation of the wagons (for example negotiating curves, Berne rectangle, shunter's handle). The device to protect against the overriding of buffers shall permit the free taking of curves by another wagon fitted with a device to protect against the overriding of buffers in a curve of 75 m radius).
- The device to protect against the overriding of buffers shall not interfere with the normal functioning of the buffers (elastic or plastic deformation) (see also special provision TE22 in 6.8.4 (b)).
- The device to protect against the overriding of buffers shall function independently of the condition of the load and the wear and tear of the wagons concerned.
- The device to protect against the overriding of buffers shall withstand a vertical force (upwards or downwards) of 150 kN.
- The device to protect against the overriding of buffers shall be effective irrespective of whether the other wagon concerned is fitted with a device to protect against the overriding of buffers. It shall not be possible for devices to protect against the overriding of buffers to obstruct each other.
- The increase in the overhang for fixing the device to protect against the overriding of buffers shall be less than 20 mm.
- The width of the device to protect against the overriding of buffers shall be at least as big as the width of the buffer head (with the exception of the device to protect against the overriding of buffers located above the left-hand footboard, which shall be tangent to the free space for the shunter, although the maximum width of the buffer must be covered).
- A device to protect against the overriding of buffers shall be located above every buffer.
- The device to protect against the overriding of buffers shall permit the attachment of buffers prescribed in UIC leaflet 573<sup>19</sup> (Technical conditions for the construction of tank-wagons) and shall not present an obstacle to maintenance work.

- The device to protect against the overriding of buffers shall be built in such a way that the risk of penetration of the tank end is not increased in the event of a shock.

Measures to limit damage when buffers override

- (b) Increasing the wall thickness of the tank ends or using other materials with a greater energy absorption capacity

In this case, the wall thickness of the tank ends shall be at least 12 mm.

However, the wall thickness of the ends of tanks for the carriage of gases UN 1017 chlorine, UN 1749 chlorine trifluoride, UN 2189 dichlorosilane, UN 2901 bromine chloride and UN 3057 trifluoroacetyl chloride shall in this case be at least 18 mm.

- (c) Sandwich cover for tank ends

If protection is provided by a sandwich cover, it shall cover the entire area of the tank ends and shall have a specific energy absorption capacity of at least 22 kJ (corresponding to a wall thickness of 6 mm), which shall be measured in accordance with the method described in Annex B to EN standard 13094 "Tanks for the transport of dangerous goods – Metallic tanks with a working pressure not exceeding 0.5 bar – Design and construction". If the risk of corrosion cannot be eliminated by structural measures, it shall be made possible to undertake an inspection of the external wall of the tank end, e.g. by providing a removable cover.

- (d) Protective shield at each end of the wagon

If a protective shield is used at each end of the wagon, the following requirements shall apply:

- the protective shield shall cover the width of the tank in each case, up to the respective height. In addition, the width of the protective shield shall, over the entire height of the shield, be at least as wide as the distance defined by the outside edge of the buffer heads;
- the height of the protective shield, measured from the top edge of the headstock, shall cover
  - either two thirds of the tank diameter
  - or at least 900 mm and shall in addition be equipped at the top edge with an arresting device for climbing buffers;
- the protective shield shall have a minimum wall thickness of 6 mm;
- the protective shield and its attachment points shall be such that the possibility of the tank ends being penetrated by the protective shield itself is minimized.

The wall thicknesses specified in (b), (c) and (d) above relate to reference steel. If other materials are used, except if mild steel is used, the equivalent thickness shall be calculated in accordance with the formula in 6.8.2.1.18. The values of  $R_m$  and  $A$  to be used shall be specified minimum values according to material standards.

**(c) Type approval (TA)**

- TA 1** Tanks shall not be approved for the carriage of organic substances.
- TA 2** This substance may be carried in tank-wagons or tank-containers under the conditions laid down by the competent authority of the country of origin, if, on the basis of the tests mentioned below, the competent authority is satisfied that such a transport operation can be carried out safely.
- If the country of origin is not a COTIF Member State, these conditions shall be recognized by the competent authority of the first COTIF Member State reached by the consignment.
- For the type approval tests shall be undertaken:
- to prove the compatibility of all materials normally in contact with the substance during carriage;
  - to provide data to facilitate the design of the emergency pressure-relief devices and safety valves taking into account the design characteristics of the tank; and
  - to establish any special requirements necessary for the safe carriage of the substance.
- The test results shall be included in the report for the type approval.
- TA 3** This substance may be carried only in tanks with the tank code LGAV or SGAV; the hierarchy in 4.3.4.1.2 is not applicable.
- TA 4** The conformity assessment procedures of section 1.8.7 shall be applied by the competent authority, its delegate or inspection body conforming to 1.8.6.4 and accredited to EN ISO/IEC 17020:2004 type A.

**(d) Tests (TT)**

- TT 1** Tanks of pure aluminium need to be subjected to the initial and periodic hydraulic pressure tests at a pressure of only 250 kPa (2.5 bar) (gauge pressure).
- TT 2** The condition of the lining of shells shall be inspected every year by an expert approved by the competent authority, who shall inspect the inside of the shell.
- TT 3** (Reserved) By derogation from the requirements of 6.8.2.4.2, periodic inspections shall take place at least every eight years and shall include a thickness check using suitable instruments. For such tanks, the leakproofness test and check for which provision is made in 6.8.2.4.3 shall be carried out at least every four years.
- TT 4** Shells shall be inspected every 4 years | 2½ years for resistance to corrosion, by means of suitable instruments (e.g. by ultrasound).
- TT 5** The hydraulic pressure tests shall take place at least every 4 years | 2½ years.
- TT 6** The periodic tests, including the hydraulic pressure test, shall be carried out at least every 4 years. | (Reserved)
- TT 7** Notwithstanding the requirements of 6.8.2.4.2, the periodic internal inspection may be replaced by a programme approved by the competent authority.
- TT 8** Tanks approved for the carriage of UN 1005 AMMONIA ANHYDROUS and constructed of fine-grained steel with a yield strength of more than 400 N/mm<sup>2</sup> in accordance with the material standard, shall be subjected at each periodic test according to 6.8.2.4.2, to magnetic particle inspections to detect surface cracking.
- For the lower part of each shell at least 20% of the length of each circumferential and longitudinal weld shall, together with all nozzle welds and any repair or ground areas, be inspected.
- TT 9** For inspections and tests (including supervision of the manufacture) the procedures of section 1.8.7 shall be applied by the competent authority, its delegate or inspection body conforming to 1.8.6.4 and accredited according to EN ISO/IEC 17020:2004 type A.

**(e) Marking (TM)**

**NOTE:** These particulars shall be in an official language of the country of approval, and also, if that language is not English, French, German or Italian, in English, French, German or Italian, unless any agreements concluded between the countries concerned in the transport operation provide otherwise.

**TM 1** Tanks shall bear in addition to the particulars prescribed in 6.8.2.5.2, the words: "DO NOT OPEN DURING CARRIAGE. LIABLE TO SPONTANEOUS COMBUSTION." (see also the Note above).

**TM 2** Tanks shall bear in addition to the particulars prescribed in 6.8.2.5.2, the words: "DO NOT OPEN DURING CARRIAGE. GIVES OFF FLAMMABLE GASES ON CONTACT WITH WATER." (see also the Note above).

**TM 3** Tanks shall also bear, on the plate prescribed in 6.8.2.5.1, the proper shipping names of the approved substances and the maximum permissible load of the tank in kg.

The load limits in accordance with 6.8.2.5.2 shall be determined in the light of the maximum permissible load mass of the shell, depending on the substance carried.

**TM 4** For tanks the following additional particulars shall be marked by stamping or by any other similar method on the plate prescribed in 6.8.2.5.2 or directly on the shell itself, if the walls are so reinforced that the strength of the tank is not impaired:

the chemical name with the approved concentration of the substance concerned.

**TM 5** Tanks shall bear, in addition to the particulars referred to in 6.8.2.5.1 the date (month, year) of the most recent inspection of the internal condition of the shell.

**TM 6** Tank-wagons shall bear an orange band in accordance with 5.3.5. (Reserved)

**TM 7** The trefoil symbol, as described in 5.2.1.7.6, shall be marked by stamping or any other equivalent method on the plate described in 6.8.2.5.1. This trefoil may be engraved directly on the walls of the shell itself, if the walls are so reinforced that the strength of the shell is not impaired.

**6.8.5 Requirements concerning the materials and construction of shells of tank-wagons and tank-containers for which a test pressure of not less than 1 MPa (10 bar) is required, and of shells of tank-wagons and tank-containers intended for the carriage of refrigerated liquefied gases of Class 2**

**6.8.5.1 Materials and shells**

**6.8.5.1.1** (a) Shells intended for the carriage of :

- compressed, liquefied gases or dissolved gases of Class 2;
  - UN Nos. 1380, 2845, 2870, 3194 and 3391 to 3394 of Class 4.2; and
  - UN No. 1052 hydrogen fluoride, anhydrous and UN No.1790 hydrofluoric acid with more than 85% hydrogen fluoride of Class 8
- shall be made of steel.

(b) Shells constructed of fine-grained steels for the carriage of:

- corrosive gases of Class 2 and UN No. 2073 ammonia solution; and
- UN No. 1052 hydrogen fluoride, anhydrous and UN No.1790 hydrofluoric acid with more than 85% hydrogen fluoride of Class 8

shall be heat-treated for thermal stress relief.

Thermal stress relief shall not be required if:

1. there is no risk of corrosion due to stress cracking; and
2. the mean notch bar impact value in the welding metal, the transition area and the base material, determined in each case by means of three samples, is an average of 45 J. ISO-V shall be used as a sample. For the base material, the sample shall be tested "crosswise". For the welding material and the transition area, notch position S in the middle of the welding metal or the middle of the transitional area shall be selected. Testing shall be carried out at the lowest operating temperature.

(c) Shells intended for the carriage of refrigerated liquefied gases of Class 2, shall be made of steel, aluminium, aluminium alloy, copper or copper alloy (e.g. brass). However, shells made of copper or copper alloy shall be allowed only for gases containing no acetylene; ethylene, however, may contain not more than 0.005% acetylene.

- (d) Only materials appropriate to the lowest and highest working temperatures of the shells and of their fittings and accessories may be used.

**6.8.5.1.2** The following materials shall be allowed for the manufacture of shells:

- (a) steels not subject to brittle fracture at the lowest working temperature (see 6.8.5.2.1):

- mild steels (except for refrigerated liquefied gases of Class 2);
- fine-grained steels, down to a temperature of  $-60\text{ }^{\circ}\text{C}$ ;
- nickel steels (with a nickel content of 0.5 to 9%), down to a temperature of  $-196\text{ }^{\circ}\text{C}$ , depending on the nickel content;
- austenitic chrome-nickel steels, down to a temperature of  $-270\text{ }^{\circ}\text{C}$ ;

- (b) aluminium not less than 99.5% pure or aluminium alloys (see 6.8.5.2.2);

- (c) deoxidized copper not less than 99.9% pure, or copper alloys having a copper content of over 56% (see 6.8.5.2.3).

**6.8.5.1.3** (a) Shells made of steel, aluminium or aluminium alloys shall be either seamless or welded.

- (b) Shells made of austenitic steel, copper or copper alloy may be hard-soldered.

**6.8.5.1.4** The fittings and accessories may either be screwed to the shells or be secured thereto as follows:

- (a) shells made of steel, aluminium or aluminium alloy: by welding;

- (b) shells made of austenitic steel, of copper or of copper alloy: by welding or hard-soldering.

**6.8.5.1.5** The construction of shells and their attachment to the underframe of the wagon or in the container frame shall be such as to preclude with certainty any such reduction in the temperature of the load-bearing components as would be likely to render them brittle. The means of attachment of shells shall themselves be so designed that even when the shell is at its lowest working temperature they still possess the necessary mechanical properties.

**6.8.5.2 Test requirements**

**6.8.5.2.1 Steel shells**

The materials used for the manufacture of shells and the weld beads shall, at their lowest working temperature, but at least at  $-20\text{ }^{\circ}\text{C}$ , meet at least the following requirements as to impact strength:

- The tests shall be carried out with test-pieces having a V-shaped notch;
- The minimum impact strength (see 6.8.5.3.1 to 6.8.5.3.3) for test-pieces with the longitudinal axis at right angles to the direction of rolling and a V-shaped notch (conforming to ISO R 148) perpendicular to the plate surface, shall be  $34\text{ J/cm}^2$  for mild steel (which, because of existing ISO standards, may be tested with test-pieces having the longitudinal axis in the direction of rolling); fine-grained steel; ferritic alloy steel  $\text{Ni} < 5\%$ , ferritic alloy steel  $5\% \leq \text{Ni} \leq 9\%$ ; or austenitic Cr-Ni steel;
- In the case of austenitic steels, only the weld bead need be subjected to an impact-strength test;
- For working temperatures below  $-196\text{ }^{\circ}\text{C}$  the impact-strength test is not performed at the lowest working temperature, but at  $-196\text{ }^{\circ}\text{C}$ .

**6.8.5.2.2 Shells made of aluminium or aluminium alloy**

The seams of shells shall meet the requirements laid down by the competent authority.

**6.8.5.2.3 Shells made of copper or copper alloy**

It is not necessary to carry out tests to determine whether the impact strength is adequate.

**6.8.5.3 Impact-strength tests**

**6.8.5.3.1** For sheets less than 10 mm but not less than 5 mm thick, test-pieces having a cross-section of 10 mm x e mm, where "e" represents the thickness of the sheet, shall be used. Machining to 7.5 mm or 5 mm is permitted if it is necessary. The minimum value of  $34\text{ J/cm}^2$  shall be required in every case.

**NOTE:** No impact-strength test shall be carried out on sheets less than 5 mm thick, or on their weld seams.

**6.8.5.3.2** (a) For the purpose of testing sheets, the impact strength shall be determined on three test-pieces. Test-pieces shall be taken at right angles to the direction of rolling; however, for mild steel they may be taken in the direction of rolling.

- (b) For testing weld seams the test-pieces shall be taken as follows:

**when  $e \leq 10\text{ mm}$ :**

three test-pieces with the notch at the centre of the weld;

three test-pieces with the notch in the centre of the heat affected zone (the V-notch to cross the fusion boundary at the centre of the specimen);

**when  $10 \text{ mm} < e \leq 20 \text{ mm}$ :**

three test-pieces from the centre of the weld;

three test-pieces from the heat affected zone (the V-notch to cross the fusion boundary at the centre of the specimen);

**when  $e > 20 \text{ mm}$**

two sets of three test-pieces, one set on the upper face, one set on the lower face at each of the points indicated below (the V-notch to cross the fusion boundary at the centre of the specimen for those taken from the heat affected zone)

- 6.8.5.3.3** (a) For sheets, the average of the three tests shall meet the minimum value of  $34 \text{ J/cm}^2$  indicated in 6.8.5.2.1; not more than one of the individual values may be below the minimum value and then not below  $24 \text{ J/cm}^2$ .
- (b) For welds, the average value obtained from the three test-pieces taken at the centre of the weld shall not be below the minimum value of  $34 \text{ J/cm}^2$ ; not more than one of the individual values may be below the minimum value and then not below  $24 \text{ J/cm}^2$ .
- (c) For the heat affected zone (the V-notch to cross the fusion boundary at the centre of the specimen) the value obtained from not more than one of the three test-pieces may be below the minimum value of  $34 \text{ J/cm}^2$ , though not below  $24 \text{ J/cm}^2$ .
- 6.8.5.3.4** If the requirements prescribed in 6.8.5.3.3 are not met, one retest only may be done if:
- (a) the average value of the first three tests is below the minimum value of  $34 \text{ J/cm}^2$ , or
- (b) more than one of the individual values is less than the minimum value of  $34 \text{ J/cm}^2$  but not below  $24 \text{ J/cm}^2$ .
- 6.8.5.3.5** In a repeated impact test on sheets or welds, none of the individual values may be below  $34 \text{ J/cm}^2$ . The average value of all the results of the original test and of the retest should be equal to or more than the minimum of  $34 \text{ J/cm}^2$ .

On a repeated impact strength test on the heat-affected zone, none of the individual values may be below  $34 \text{ J/cm}^2$ .

**6.8.5.4 Reference to standards**

The requirements of 6.8.5.2 and 6.8.5.3 shall be deemed to have been complied with if the following relevant standards have been applied:

EN 1252-1:1998 Cryogenic vessels – Materials – Part 1: Toughness requirements for temperature below –80 °C.

EN 1252-2: 2001 Cryogenic vessels – Materials – Part 2: Toughness requirements for temperature between –80 °C and –20 °C.

## Chapter 6.9

### Requirements for the design, construction, equipment, type approval, testing and marking of fibre-reinforced plastics (FRP) tank-containers including tank swap bodies

**NOTE:** For portable tanks and UN multiple-element gas containers (MEGCs) see Chapter 6.7; for tank-wagons, demountable tanks and tank-containers and tank swap bodies, with shells made of metallic materials, and battery-wagons and multiple element gas containers (MEGCs) other than UN MEGCs see Chapter 6.8; for vacuum-operated waste tanks see Chapter 6.10.

#### 6.9.1 General

**6.9.1.1** FRP tank-containers including tank swap bodies shall be designed, manufactured and tested in accordance with a quality assurance programme recognized by the competent authority; in particular, lamination work and welding of thermoplastic liners shall only be carried out by qualified personnel in accordance with a procedure recognized by the competent authority.

**6.9.1.2** For the design and testing of FRP tank-containers including tank swap bodies, the provisions of 6.8.2.1.1, 6.8.2.1.7, 6.8.2.1.13, 6.8.2.1.14 (a) and (b), 6.8.2.1.25, 6.8.2.1.27 and 6.8.2.2.3 shall also apply.

**6.9.1.3** Heating elements shall not be used for FRP tank-containers including tank swap bodies.

**6.9.1.4** (Reserved)

#### 6.9.2 Construction

**6.9.2.1** Shells shall be made of suitable materials, which shall be compatible with the substances to be carried in a service temperature range of between  $-40^{\circ}\text{C}$  and  $+50^{\circ}\text{C}$ , unless temperature ranges are specified for specific climatic conditions by the competent authority of the country where the transport operation is performed.

**6.9.2.2** Shells shall consist of the following three elements :

- internal liner,
- structural layer,
- external layer.

**6.9.2.2.1** The internal liner is the inner shell wall zone designed as the primary barrier to provide for the long-term chemical resistance in relation to the substances to be carried, to prevent any dangerous reaction with the contents or the formation of dangerous compounds and any substantial weakening of the structural layer owing to the diffusion of products through the internal liner.

The internal liner may either be a FRP liner or a thermoplastic liner.

**6.9.2.2.2** FRP liners shall consist of:

- (a) surface layer ("gel-coat"): adequate resin rich surface layer, reinforced with a veil, compatible with the resin and contents. This layer shall have a fibre mass content of not more than 30% and have a thickness between 0.25 and 0.60 mm;
- (b) strengthening layer(s): layer or several layers with a minimum thickness of 2 mm, containing a minimum of 900 g/m<sup>2</sup> of glass mat or chopped fibres with a mass content in glass of not less than 30% unless equivalent safety is demonstrated for a lower glass content.

**6.9.2.2.3** Thermoplastic liners shall consist of thermoplastic sheet material as referred to in 6.9.2.3.4, welded together in the required shape, to which the structural layers are bonded. Durable bonding between liners and the structural layer shall be achieved by the use of an appropriate adhesive.

**NOTE:** For the carriage of flammable liquids the internal layer may require additional measures in accordance with 6.9.2.14, in order to prevent the accumulation of electrical charges.

**6.9.2.2.4** The structural layer of the shell is the zone specially designed according to 6.9.2.4 to 6.9.2.6 to withstand the mechanical stresses. This part normally consists of several fibre reinforced layers in determined orientations.

**6.9.2.2.5** The external layer is the part of the shell which is directly exposed to the atmosphere. It shall consist of a resin rich layer with a thickness of at least 0.2 mm. For a thickness larger than 0.5 mm, a mat shall be used. This layer shall have a mass content in glass of less than 30% and shall be capable of withstanding exterior conditions, in particular the occasional contact with the substance to be carried. The resin shall contain fillers or additives to provide protection against deterioration of the structural layer of the shell by ultra-violet radiation.

**6.9.2.3 Raw materials**

**6.9.2.3.1** All materials used for the manufacture of FRP tank-containers including tank swap bodies shall be of known origin and specifications.

**6.9.2.3.2 Resins**

The processing of the resin mixture shall be carried out in strict compliance with the recommendations of the supplier. This concerns mainly the use of hardeners, initiators and accelerators. These resins can be:

- unsaturated polyester resins;
- vinyl ester resins;
- epoxy resins;
- phenolic resins.

The heat distortion temperature (HDT) of the resin, determined in accordance with ISO 75-1:1993 shall be at least 20 °C higher than the maximum service temperature of the tank-container including tank swap bodies, but shall in any case not be lower than 70 °C.

**6.9.2.3.3 Reinforcement fibres**

The reinforcement material of the structural layers shall be a suitable grade of fibres such as glass fibres of type E or ECR according to ISO 2078:1993. For the internal surface liner, glass fibres of type C according to ISO 2078:1993 may be used. Thermoplastic veils may only be used for the internal liner when their compatibility with the intended contents has been demonstrated.

**6.9.2.3.4 Thermoplastic liner material**

Thermoplastic liners, such as unplasticized polyvinyl chloride (PVC-U), polypropylene (PP), polyvinylidene fluoride (PVDF), polytetrafluoroethylene (PTFE), etc. may be used as lining materials.

**6.9.2.3.5 Additives**

Additives necessary for the treatment of the resin, such as catalysts, accelerators, hardeners and thixotropic substances as well as materials used to improve the tank, such as fillers, colours, pigments etc. shall not cause weakening of the material, taking into account lifetime and temperature expectancy of the design.

**6.9.2.4** Shells, their attachments and their service and structural equipment shall be designed to withstand without loss of contents (other than quantities of gas escaping through any degassing vents) during the design lifetime:

- the static and dynamic loads in normal conditions of carriage;
- the prescribed minimum loads as defined in 6.9.2.5 to 6.9.2.10.

**6.9.2.5** At the pressures as indicated in 6.8.2.1.14 (a) and (b), and under the static gravity forces caused by the contents with maximum density specified for the design and at maximum filling degree, the design stress  $\sigma$  in longitudinal and circumferential direction of any layer of the shell shall not exceed the following value:

$$\sigma \leq \frac{R_m}{K}$$

where:

$R_m$  = the value of tensile strength given by taking the mean value of the test results minus twice the standard deviation of the test results. The tests shall be carried out, in accordance with the requirements of EN 61:1977, on not less than six samples representative of the design type and construction method;

$K = S \times K_0 \times K_1 \times K_2 \times K_3$

where

$K$  shall have a minimum value of 4, and

$S$  = the safety coefficient. For the general design, if the tanks are referred to in Column (12) of Table A of Chapter 3.2 by a tank code including the letter "G" in its second part (see 4.3.4.1.1), the value for  $S$  shall be equal to or more than 1.5. For tanks intended for the carriage of substances which require an increased safety level, i.e. if the tanks are referred to in Column (12) of Table A of Chapter 3.2 by a tank code including the number "4" in its second part (see 4.3.4.1.1), the value of  $S$  shall be multiplied by a factor of two, unless the shell is provided with protection against damage consisting of a complete metal skeleton including longitudinal and transverse structural members;

$K_0$  = a factor related to the deterioration in the material properties due to creep and ageing and as a result of the chemical action of the substances to be carried. It shall be determined by the formula:

$$K_0 = \frac{1}{\alpha \cdot \beta}$$

where " $\alpha$ " is the creep factor and " $\beta$ " is the ageing factor determined in accordance with EN 978:1997 after performance of the test according to EN 977:1997. Alternatively, a conservative value of  $K_0 = 2$  may be applied. In order to determine  $\alpha$  and  $\beta$  the initial deflection shall correspond to  $2\sigma$ ;

$K_1$  = a factor related to the service temperature and the thermal properties of the resin, determined by the following equation, with a minimum value of 1:

$$K_1 = 1.25 - 0.0125 (\text{HDT} - 70)$$

where HDT is the heat distortion temperature of the resin, in °C;

$K_2$  = a factor related to the fatigue of the material; the value of  $K_2 = 1.75$  shall be used unless otherwise agreed with the competent authority. For the dynamic design as outlined in 6.9.2.6 the value of  $K_2 = 1.1$  shall be used;

$K_3$  = a factor related to curing and has the following values:

- 1.1 where curing is carried out in accordance with an approved and documented process;
- 1.5 in other cases.

**6.9.2.6** At the dynamic stresses, as indicated in 6.8.2.1.2 the design stress shall not exceed the value specified in 6.9.2.5, divided by the factor  $\alpha$ .

**6.9.2.7** At any of the stresses as defined in 6.9.2.5 and 6.9.2.6, the resulting elongation in any direction shall not exceed 0.2% or one tenth of the elongation at fracture of the resin, whichever is lower.

**6.9.2.8** At the specified test pressure, which shall not be less than the relevant calculation pressure as specified in 6.8.2.1.14 (a) and (b) the maximum strain in the shell shall not be greater than the elongation at fracture of the resin.

**6.9.2.9** The shell shall be capable of withstanding the ball drop test according to 6.9.4.3.3 without any visible internal or external defects.

**6.9.2.10** The overlay laminates used in the joints, including the end joints, the joints of the surge plates and the partitions with the shell shall be capable of withstanding the static and dynamic stresses mentioned above. In order to avoid concentrations of stresses in the overlay lamination, the applied taper shall not be steeper than 1:6.

The shear strength between the overlay laminate and the tank components to which it is bonded shall not be less than:

$$\tau = \frac{Q}{l} \leq \frac{\tau_R}{K}$$

where:

$\tau_R$  is the bending shear strength according to EN ISO 14125:1998 (three points method) with a minimum of  $\tau_R = 10 \text{ N/mm}^2$ , if no measured values are available;

$Q$  is the load per unit width that the joint shall carry under the static and dynamic loads;

$K$  is the factor calculated in accordance with 6.9.2.5 for the static and dynamic stresses;

$l$  is the length of the overlay laminate.

**6.9.2.11** Openings in the shell shall be reinforced to provide at least the same safety factors against the static and dynamic stresses as specified in 6.9.2.5 and 6.9.2.6 as that for the shell itself. The number of openings shall be minimized. The axis ratio of oval-shaped openings shall be not more than 2.

**6.9.2.12** For the design of flanges and pipework attached to the shell, handling forces and the fastening of bolts shall also be taken into account.

**6.9.2.13** The tank-container including tank swap bodies shall be designed to withstand, without significant leakage, the effects of a full engulfment in fire for 30 minutes as specified by the test requirements in 6.9.4.3.4. Testing may be waived with the agreement of the competent authority, where sufficient proof can be provided by tests with comparable tank designs.

**6.9.2.14 Special requirements for the carriage of substances with a flash-point of not more than 60 °C**

FRP tank-container including tank swap bodies used for the carriage of substances with a flash-point of not more than 60 °C shall be constructed so as to ensure the elimination of static electricity from the various component parts so as to avoid the accumulation of dangerous charges.

**6.9.2.14.1** The electrical surface resistance of the inside and outside of the shell as established by measurements shall not be higher than  $10^9$  ohms. This may be achieved by the use of additives in the resin or interlaminar conducting sheets, such as metal or carbon network.

**6.9.2.14.2** The discharge resistance to earth as established by measurements shall not be higher than  $10^7$  ohms.

**6.9.2.14.3** All components of the shell shall be electrically connected to each other and to the metal parts of the service and structural equipment of the tank-container including tank swap bodies. The electrical resistance between components and equipment in contact with each other shall not exceed 10 ohms.

**6.9.2.14.4** The electrical surface-resistance and discharge resistance shall be measured initially on each manufactured tank-container including tank swap bodies or a specimen of the shell in accordance with a procedure recognized by the competent authority.

**6.9.2.14.5** The discharge resistance to earth of each tank-container including tank swap bodies shall be measured as part of the periodic inspection in accordance with a procedure recognized by the competent authority.

**6.9.3 Items of equipment**

**6.9.3.1** The requirements of 6.8.2.2.1, 6.8.2.2.2 and 6.8.2.2.4 to 6.8.2.2.8 shall apply.

**6.9.3.2** In addition, when they are shown under an entry in Column (13) of Table A of Chapter 3.2, the special provisions of 6.8.4 (b) (TE) shall also apply.

**6.9.4 Type testing and approval**

**6.9.4.1** For any design of a FRP tank-container type, including tank swap bodies, its materials and a representative prototype shall be subjected to the design type testing as outlined below.

**6.9.4.2 Material testing**

**6.9.4.2.1** The elongation at fracture according to EN ISO 527-5:1997 and the heat distortion temperature according to ISO 75-1:1993 shall be determined for the resins to be used.

**6.9.4.2.2** The following characteristics shall be determined for samples cut out of the shell. Samples manufactured in parallel may only be used, if it is not possible to use cutouts from the shell. Prior to testing, any liner shall be removed.

The tests shall cover:

- Thickness of the laminates of the central shell wall and the ends;
- Mass content and composition of glass, orientation and arrangement of reinforcement layers;
- Tensile strength, elongation at fracture and modulus of elasticity according to EN ISO 527-5:1997 in the direction of stresses. In addition, the elongation at fracture of the resin shall be established by means of ultrasound;
- Bending strength and deflection established by the bending creep test according to EN ISO 14125:1998 for a period of 1000 hours using a sample with a minimum width of 50 mm and a support distance of at least 20 times the wall thickness. In addition, the creep factor  $\alpha$  and the ageing factor  $\beta$  shall be determined by this test and according to EN 978:1997.

**6.9.4.2.3** The interlaminar shear strength of the joints shall be measured by testing representative samples in the tensile test according to EN ISO 14130:1997.

**6.9.4.2.4** The chemical compatibility of the shell with the substances to be carried shall be demonstrated by one of the following methods with the agreement of the competent authority. This demonstration shall account for all aspects of the compatibility of the materials of the shell and its equipment with the substances to be carried, including chemical deterioration of the shell, initiation of critical reactions of the contents and dangerous reactions between both.

- In order to establish any deterioration of the shell, representative samples taken from the shell, including any internal liners with welds, shall be subjected to the chemical compatibility test according to EN 977:1997 for a period of 1 000 hours at 50 °C. Compared with a virgin sample, the loss of strength and elasticity modulus measured by the bending test according to EN 978:1997 shall not exceed 25%. Cracks, bubbles, pitting effects as well as separation of layers and liners and roughness shall not be acceptable.

- Certified and documented data of positive experiences on the compatibility of the filling substances in question with the materials of the shell with which they come into contact at given temperatures, times and any other relevant service conditions.
- Technical data published in relevant literature, standards or other sources, acceptable to the competent authority.

#### **6.9.4.3 Type testing**

A representative prototype tank shall be subjected to tests as specified below. For this purpose service equipment may be replaced by other items if necessary.

**6.9.4.3.1** The prototype shall be inspected for compliance with the design type specification. This shall include an internal and external visual inspection and measurement of the main dimensions.

**6.9.4.3.2** The prototype, equipped with strain gauges at all locations where a comparison with the design calculation is required, shall be subjected to the following loads and the strains shall be recorded:

- Filled with water to the maximum filling degree. The measuring results shall be used to calibrate the design calculation according to 6.9.2.5;
- Filled with water to the maximum filling degree and subjected to accelerations in all three directions by means of driving and braking exercises with the prototype attached to a wagon. For comparison with the design calculation according to 6.9.2.6 the strains recorded shall be extrapolated in relation to the quotient of the accelerations required in 6.8.2.1.2 and measured;
- Filled with water and subjected to the specified test pressure. Under this load, the shell shall exhibit no visual damage or leakage.

**6.9.4.3.3** The prototype shall be subjected to the ball drop test according to EN 976-1:1997, No. 6.6. No visible damage inside or outside the tank shall occur.

**6.9.4.3.4** The prototype with its service and structural equipment in place and filled to 80% of its maximum capacity with water, shall be exposed to a full engulfment in fire for 30 minutes, caused by an open heating oil pool fire or any other type of fire with the same effect. The dimensions of the pool shall exceed those of the tank by at least 50 cm to each side and the distance between fuel level and tank shall be between 50 cm and 80 cm. The rest of the tank below liquid level, including openings and closures, shall remain leakproof except for drips.

#### **6.9.4.4 Type approval**

**6.9.4.4.1** The competent authority or a body designated by that authority shall issue in respect of each new type of tank-container including tank swap bodies an approval attesting that the design is suitable for the purpose for which it is intended and meets the construction and equipment requirements of this chapter as well as the special provisions applicable to the substances to be carried.

**6.9.4.4.2** The approval shall be based on the calculation and the test report, including all material and prototype test results and its comparison with the design calculation, and shall refer to the design type specification and the quality assurance programme.

**6.9.4.4.3** The approval shall include the substances or group of substances for which compatibility with the tank-container including tank swap bodies is provided. Their chemical names or the corresponding collective entry (see 2.1.1.2), and their class and classification code shall be indicated.

**6.9.4.4.4** In addition, it shall include design and threshold values (such as life-time, service temperature range, working and test pressures, material data) specified and all precautions to be taken for the manufacture, testing, type approval, marking and use of any tank-container including tank swap bodies, manufactured in accordance with the approved design type.

#### **6.9.5 Inspections**

**6.9.5.1** For every tank-container including tank swap bodies, manufactured in conformity with the approved design, material tests and inspections shall be performed as specified below.

**6.9.5.1.1** The material tests according to 6.9.4.2.2, except for the tensile test and for a reduction of the testing time for the bending creep test to 100 hours shall be performed with samples taken from the shell. Samples manufactured in parallel may only be used, if no cutouts from the shell are possible. The approved design values shall be met.

**6.9.5.1.2** Shells and their equipment shall either together or separately undergo an initial inspection before being put into service. This inspection shall include:

- a check of conformity to the approved design;
- a check of the design characteristics;
- an internal and external examination;

- a hydraulic pressure test at the test pressure indicated on the plate prescribed in 6.8.2.5.1;
- a check of operation of the equipment;
- a leakproofness test, if the shell and its equipment have been pressure tested separately.

**6.9.5.2** For the periodic inspection of tank-containers including tank swap bodies the requirements of 6.8.2.4.2 to 6.8.2.4.4 shall apply. In addition, the inspection in accordance with 6.8.2.4.3 shall include an examination of the internal condition of the shell.

**6.9.5.3** The inspections and tests in accordance with 6.9.5.1 and 6.9.5.2 shall be carried out by the expert approved by the competent authority. Certificates shall be issued showing the results of these operations. These certificates shall refer to the list of the substances permitted for carriage in this tank-container including tank swap bodies in accordance with 6.9.4.4.

**6.9.6 Marking**

**6.9.6.1** The requirements of 6.8.2.5 shall apply to the marking of FRP tank-containers including tank swap bodies, with the following amendments:

- the tank plate may also be laminated to the shell or be made of suitable plastics materials;
- the design temperature range shall always be marked.

**6.9.6.2** In addition, when they are shown under an entry in Column (13) of Table A of Chapter 3.2, the special provisions of 6.8.4 (e) (TM) shall also apply.

## Chapter 6.10

### Requirements for the construction, equipment, type approval, inspection and marking of vacuum-operated waste tanks

**NOTE** 1: For portable tanks and UN multiple element gas containers (MEGCs), see Chapter 6.7; for tank-wagons, demountable tanks, tank-containers and tank swap bodies, with shells made of metallic materials, and battery-wagons and multiple element gas containers (MEGCs) other than UN MEGCs see Chapter 6.8; for fibre reinforced plastic tank-containers, see Chapter 6.9.

2: This Chapter applies to tank-containers and tank swap bodies.

#### 6.10.1 General

##### 6.10.1.1 Definitions

**NOTE:** A tank which fully complies with the requirements of Chapter 6.8 is not considered to be a "vacuum-operated waste tank".

6.10.1.1.1 The term "protected area" means the areas located as follows:

- (a) The lower part of the tank in a zone which extends over a 60 ° angle on either side of the lower generating line;
- (b) The top part of a tank in a zone which extends over a 30 ° angle on either side of the top generating line.

##### 6.10.1.2 Scope

6.10.1.2.1 The special requirements of 6.10.2 to 6.10.4 complete or modify Chapter 6.8 and are applied to vacuum-operated waste tanks.

Vacuum-operated waste tanks may be equipped with openable ends, if the requirements of Chapter 4.3 allow bottom discharge of the substances to be carried (indicated by the letters "A" or "B" in the tank code given in Column (12) of Table A of Chapter 3.2, in accordance with 4.3.4.1.1).

Vacuum-operated waste tanks shall comply with all the requirements of Chapter 6.8, with the exception of requirements overtaken by a special provision in this Chapter. However, the requirements of 6.8.2.1.19 and 6.8.2.1.20 shall not apply.

#### 6.10.2 Construction

6.10.2.1 Tanks shall be designed for a calculation pressure equal to 1.3 times the filling or discharge pressure but not less than 400 kPa (4 bar) (gauge pressure). For the carriage of substances for which a higher calculation pressure of the tank is specified in Chapter 6.8, this higher pressure shall apply.

6.10.2.2 Tanks shall be designed to withstand a negative internal pressure of 100 kPa (1 bar).

#### 6.10.3 Items of equipment

6.10.3.1 The items of equipment shall be so arranged as to be protected against the risk of being wrenched off or damaged during carriage or handling. This requirement can be fulfilled by placing items of equipment in a so-called "protected area" (see 6.10.1.1.1).

6.10.3.2 The bottom discharge of shells may be constituted by external piping with a stop-valve fitted as close to the shell as practicable and a second closure which may be a blank flange or other equivalent device.

6.10.3.3 The position and closing direction of the stop-valve(s) connected to the shell, or to any compartment in the case of compartmented shells, shall be unambiguous, and be able to be checked from the ground.

6.10.3.4 In order to avoid any loss of contents in the event of damage to the external filling and discharge fittings (pipes, lateral shut-off devices), the internal stop-valve, or the first external stop-valve (where applicable), and its seatings shall be protected against the danger of being wrenched off by external stresses or shall be so designed as to withstand them. The filling and discharge devices (including flanges or threaded plugs) and protective caps (if any) shall be capable of being secured against any unintended opening.

6.10.3.5 The tanks may be equipped with openable ends. Openable ends shall comply with the following conditions:

- (a) The ends shall be designed to be secured leaktight when closed;
- (b) Unintentional opening shall not be possible;
- (c) Where the opening mechanism is power operated the end shall remain securely closed in the event of a power failure;

- (d) A safety or breakseal device shall be incorporated to ensure that the openable end cannot be opened when there is still a residual over pressure in the tank. This requirement does not apply to openable ends which are power-operated, where the movement is positively controlled. In this case the controls shall be of the dead-man type and be so positioned that the operator can observe the movement of the openable end at all times and is not endangered during opening and closing of the openable end; and
- (e) Provisions shall be made to protect the openable end and prevent it from being forced open during a roll-over of the tank-container or tank swap body.

**6.10.3.6** Vacuum-operated waste tanks which are fitted with an internal piston to assist in the cleaning of the tank or discharging shall be provided with stop-devices to prevent the piston in every operational position being ejected from the tank when a force equivalent to the maximum working pressure of the tank is applied to the piston. The maximum working pressure for tanks or compartments with pneumatic operated piston shall not exceed 100 kPa (1.0 bar). The internal piston shall be constructed in a manner and of materials which will not cause an ignition source when the piston is moved.

The internal piston may be used as a compartment provided it is secured in position. Where any of the means by which the internal piston is secured is external to the tank, it shall be placed in a position not liable to accidental damage.

**6.10.3.7** The tanks may be equipped with suction booms if:

- (a) the boom is fitted with an internal or external stop-valve fixed directly to the shell, or directly to a bend that is welded to the shell; a rotation crown wheel can be fitted between the shell or the bend and the external stop valve, if this rotation crown wheel is located in the protected area and the stop-valve control device is protected with a housing or cover against the danger of being wrenched off by external loads;
- (b) the stop-valve mentioned in (a) is so arranged that carriage with the valve in an open position is prevented; and
- (c) the boom is constructed in such a way that the tank will not leak as a result of accidental impact on the boom.

**6.10.3.8** The tanks shall be fitted with the following additional service equipment:

- (a) The outlet of a pump/exhauster unit shall be so arranged as to ensure that any flammable or toxic vapours are diverted to a place where they will not cause a danger;
- (b) A device to prevent immediate passage of flame shall be fitted to both the inlet and outlet of a vacuum pump/exhauster unit which may create sparks and which is fitted on a tank used for the carriage of flammable wastes;
- (c) Pumps which can deliver a positive pressure shall have a safety device fitted in the pipework which can be pressurised. The safety device shall be set to discharge at a pressure not exceeding the maximum working pressure of the tank;
- (d) A stop-valve shall be fitted between the shell, or the outlet of the overfill prevention device fitted to the shell, and the pipework connecting the shell to the pump/exhauster unit;
- (e) The tank shall be fitted with a suitable pressure/vacuum manometer which shall be mounted in a position where it can be easily read by the person operating the pump/exhauster unit. A distinguishing line shall be marked on the scale to indicate the maximum working pressure of the tank;
- (f) The tank, or in case of compartmented tanks, every compartment, shall be equipped with a level indicating device. Sight glasses may be used as level indicating devices, provided:
  - (i) they form a part of the tank wall and have a resistance to pressure comparable to that of the tank; or they must be fitted external to the tank;
  - (ii) the top and bottom connections to the tank are equipped with shut-off valves fixed directly to the shell and so arranged that carriage with the valves in an open position is prevented;
  - (iii) they are suitable for operation at the maximum working pressure of the tank; and
  - (iv) they are placed in a position where they will not be liable to accidental damage.

**6.10.3.9** The shells of vacuum-operated waste tanks shall be fitted with a safety valve preceded by a bursting disc.

The valve shall be capable of opening automatically at a pressure between 0.9 and 1.0 times the test pressure of the tank to which it is fitted. The use of dead weight or counterweight valves is prohibited.

The bursting disc shall burst at the earliest when the initial opening pressure of the valve is reached and at the latest when this pressure reaches the test pressure of the tank to which it is fitted.

Safety devices shall be of such a type as to resist dynamic stresses, including liquid surge.

The space between the bursting disc and the safety valve shall be provided with a pressure gauge or suitable tell-tale indicator for the detection of disc rupture, pinholing or leakage which could cause a malfunction of the safety valve.

**6.10.4      Inspection**

Vacuum-operated waste tanks shall be subject at least every two and a half years to an examination of the internal condition, in addition to the tests according to 6.8.2.4.3.

## Chapter 6.11

### Requirements for the design, construction, inspection and testing of bulk containers

#### 6.11.1 Definitions

For the purposes of this Chapter:

*Closed bulk container* means a totally closed bulk container having a rigid roof, sidewalls, end walls and floor (including hopper-type bottoms). The term includes bulk containers with an opening roof, side or end wall that can be closed during carriage. Closed bulk containers may be equipped with openings to allow for the exchange of vapours and gases with air and which under normal conditions of carriage prevent the release of solid contents as well as the penetration of rain and splash water;

*Sheeted bulk container* means an open top bulk container with rigid bottom (including hopper-type bottom), side and end walls and a non-rigid covering.

#### 6.11.2 Application and general requirements

**6.11.2.1** Bulk containers and their service and structural equipment shall be designed and constructed to withstand, without loss of contents, the internal pressure of the contents and the stresses of normal handling and carriage.

**6.11.2.2** Where a discharge valve is fitted, it shall be capable of being made secure in the closed position and the whole discharge system shall be suitably protected from damage. Valves having lever closures shall be able to be secured against unintended opening and the open or closed position shall be readily apparent.

#### 6.11.2.3 Code for designating types of bulk container

The following table indicates the codes to be used for designating types of bulk containers:

Types of bulk containers	Code
Sheeted bulk container	BK1
Closed bulk container	BK2

**6.11.2.4** In order to take account of progress in science and technology, the use of alternative arrangements which offer at least equivalent safety as provided by the requirements of this chapter may be considered by the competent authority.

#### 6.11.3 Requirements for the design, construction, inspection and testing of containers conforming to the CSC used as bulk containers

##### 6.11.3.1 Design and construction requirements

**6.11.3.1.1** The general design and construction requirements of this sub-section are deemed to be met if the bulk container complies with the requirements of ISO 1496-4:1991 "Series 1 Freight containers – Specification and testing – Part 4: Non pressurized containers for dry bulk" and the container is siftproof.

**6.11.3.1.2** Containers designed and tested in accordance with ISO 1496-1:1990 "Series 1 Freight containers – Specification and testing – Part 1: General cargo containers for general purposes" shall be equipped with operational equipment which, including its connection to the container, is designed to strengthen the end walls and to improve the longitudinal restraint as necessary to comply with the test requirements of ISO 1496-4:1991 as relevant.

**6.11.3.1.3** Bulk containers shall be siftproof. Where a liner is used to make the container siftproof it shall be made of a suitable material. The strength of material used for, and the construction of, the liner shall be appropriate to the capacity of the container and its intended use. Joins and closures of the liner shall withstand pressures and impacts liable to occur under normal conditions of handling and carriage. For ventilated bulk containers any liner shall not impair the operation of ventilating devices.

**6.11.3.1.4** The operational equipment of bulk containers designed to be emptied by tilting shall be capable of withstanding the total filling mass in the tilted orientation.

**6.11.3.1.5** Any movable roof or side or end wall or roof section shall be fitted with locking devices with securing devices designed to show the locked state to an observer at ground level.

**6.11.3.2 Service equipment**

**6.11.3.2.1** Filling and discharge devices shall be so constructed and arranged as to be protected against the risk of being wrenched off or damaged during carriage and handling. The filling and discharge devices shall be capable of being secured against unintended opening. The open and closed position and direction of closure shall be clearly indicated.

**6.11.3.2.2** Seals of openings shall be so arranged as to avoid any damage by the operation, filling and emptying of the bulk container.

**6.11.3.2.3** Where ventilation is required bulk containers shall be equipped with means of air exchange, either by natural convection, e.g. by openings, or active elements, e.g. fans. The ventilation shall be designed to prevent negative pressures in the container at all times. Ventilating elements of bulk containers for the carriage of flammable substances or substances emitting flammable gases or vapours shall be designed so as not to be a source of ignition.

**6.11.3.3 Inspection and testing**

**6.11.3.3.1** Containers used, maintained and qualified as bulk containers in accordance with the requirements of this section shall be tested and approved in accordance with the CSC.

**6.11.3.3.2** Containers used and qualified as bulk containers shall be inspected periodically according to the CSC.

**6.11.3.4 Marking**

**6.11.3.4.1** Containers used as bulk containers shall be marked with a Safety Approval Plate in accordance with the CSC.

**6.11.4 Requirements for the design, construction and approval of bulk containers other than containers conforming to the CSC**

**NOTE:** When containers conforming to the provisions of this section are used for the carriage of solids in bulk, the following statement shall be shown on the transport document:

"BULK CONTAINER BK(X) APPROVED BY THE COMPETENT AUTHORITY OF ..." (see 5.4.1.1.17).

**6.11.4.1** Bulk containers covered in this section include skips, offshore bulk containers, bulk bins, swap bodies, trough shaped containers, roller containers, and load compartments of wagons.

**NOTE:** These bulk containers also include containers conforming to the UIC leaflets 591 and 592-2 to 592-4 as mentioned in 7.1.3 which do not conform to the CSC.

**6.11.4.2** These bulk containers shall be designed and constructed so as to be strong enough to withstand the shocks and loadings normally encountered during carriage including, as applicable, transshipment between modes of transport.

**6.11.4.3** (Reserved)

**6.11.4.4** These bulk containers shall be approved by the competent authority and the approval shall include the code for designating types of bulk containers in accordance with 6.11.2.3 and the requirements for inspection and testing as appropriate.

**6.11.4.5** Where it is necessary to use a liner in order to retain the dangerous goods it shall meet the provisions of 6.11.3.1.3.

**Part 7**

**Provisions concerning the conditions of carriage, loading, unloading and handling**

## Chapter 7.1

### General provisions

- 7.1.1** The carriage of dangerous goods is subject to the mandatory use of a particular type of transport equipment in accordance with the provisions of this Chapter and Chapter 7.2 for carriage in packages and Chapter 7.3 for carriage in bulk. In addition, the provisions of Chapter 7.5 concerning loading, unloading and handling shall be observed.
- Columns (16), (17) and (18) of Table A of Chapter 3.2 show the particular provisions of this Part that apply to specific dangerous goods.
- 7.1.2** Road vehicles handed over for carriage by piggyback transport, as well as their contents, shall comply with the provisions of the European Agreement concerning the International Carriage of Dangerous Goods by Road (ADR)<sup>1</sup>.
- 7.1.3** Large containers, portable tanks and tank-containers which meet the definition of "container" given in the CSC (1972), as amended, or in UIC leaflets 591 (status at 01.01.1998, 2<sup>nd</sup> edition), 592-2 (status at 01.10.2004, 6<sup>th</sup> edition), 592-3 (status at 01.01.1998, 2<sup>nd</sup> edition) and 592-4 (status at 01.09.2004, 2<sup>nd</sup> edition) may not be used to carry dangerous goods unless the large container or the frame of the portable tank or tank-container satisfies the provisions of the CSC or of UIC leaflets 591 and 592-2 to 592-4.
- 7.1.4** A large container may be presented for carriage only if it is structurally serviceable.
- "Structurally serviceable" means that the container is free from major defects in its structural components, e.g. top and bottom side rails, doorsill and header, floor cross members, corner posts, and corner fittings. "Major defects" are dents or bends in structural members greater than 19 mm in depth, regardless of length; cracks or breaks in structural members; more than one splice or an improper splice (e.g. a lapped splice) in top or bottom end rails or door headers or more than two splices in any one top or bottom side rail or any splice in a door sill or corner post; door hinges and hardware that are seized, twisted, broken, missing or otherwise inoperative; non-closing gaskets and seals; any distortion of the overall configuration sufficient to prevent proper alignment of handling equipment, mounting and securing on a chassis or wagon.
- In addition, deterioration in any component of the container, such as rusted metal in side walls or disintegrated fibreglass is unacceptable, regardless of the material of construction. Normal wear, including oxidation (rust), slight dents and scratches and other damage that do not affect serviceability or weather-tightness are, however, acceptable.
- Prior to loading the container shall also be checked to ensure that it is free from any residue of a previous load and that the interior floor and walls are free from protrusions.
- 7.1.5** (Reserved)
- 7.1.6** (Reserved)
- 7.1.7** Substances and articles of RID, except those which are handed over for carriage as colis express, may only be forwarded in freight trains.

---

<sup>1</sup> This Agreement also includes the special agreements which have been signed by all the countries involved in the transport operation.

## Chapter 7.2

### Provisions concerning carriage in packages

- 7.2.1** Unless otherwise provided in 7.2.2 to 7.2.4, packages may be loaded:
- (a) into closed wagons or into closed containers; or
  - (b) into sheeted wagons or into sheeted containers; or
  - (c) into open wagons (unsheeted) or into open containers (unsheeted).
- 7.2.2** Packages comprising packagings made of materials sensitive to moisture shall be loaded into closed or sheeted wagons or into closed or sheeted containers.
- 7.2.3** (Reserved)
- 7.2.4** When an alphanumeric code beginning with the letter "W" is shown in column (16) of Table A of Chapter 3.2, the following special provisions apply:
- W 1** Packages shall be loaded into closed or sheeted wagons or into closed or sheeted containers.
- W 2** Substances and articles of Class 1 shall be loaded into closed wagons or closed containers. Articles which, because of their dimensions or their mass, cannot be loaded into closed wagons or closed containers may equally be carried in open wagons or open containers. They shall be covered by sheets. Only wagons fitted with regulation sheet steel spark-guards shall be used for the carriage of substances and articles of divisions 1.1, 1.2, 1.3, 1.5 and 1.6, even when these substances and articles are loaded into large containers. For wagons fitted with a combustible floor, the sheet steel spark-guards shall not be fixed directly to the floor of the wagon.
- Military consignments of substances and articles of Class 1 which form part of military equipment and of the structure of military material, may also be loaded into open wagons under the following conditions:
- consignments shall be accompanied by the competent military authority or, by order of this authority,
  - means of initiation not having at least two effective protective devices shall be removed, unless the substances and articles are placed in locked military vehicles.
- W 3** For free-flowing powdery substances and for fireworks the floor of a wagon or container shall have a non-metallic surface or covering.
- W 4** (Reserved)
- W 5** Packages may not be carried in small containers.
- W 6** (Reserved)
- W 7** Packages shall be carried in a closed wagon or in a closed container provided with adequate ventilation.
- W 8** For the carriage of packages bearing an additional label in accordance with Model No. 1, only wagons fitted with regulation sheet steel spark-guards shall be used, even when these substances are loaded in large containers. For wagons fitted with a combustible floor, the sheet steel spark-guards shall not be fixed directly to the floor of the wagon.
- W 9** Packages shall be carried in closed wagons or in movable-roof wagons or in closed containers.
- W 10** IBCs shall be carried in closed or sheeted wagons or closed or sheeted containers.
- W 11** IBCs other than metal or rigid plastics IBCs shall be carried in closed or sheeted wagons or closed or sheeted containers.
- W 12** IBCs of type 31HZ2 shall be carried in closed wagons or containers.
- W 13** When packed in 5H1, 5L1 or 5 M1 bags, shall be carried in closed wagons or containers.
- W 14** Aerosols carried for the purposes of reprocessing or disposal under special provision 327 in Chapter 3.3 shall only be carried in ventilated or open wagons or containers.

## Chapter 7.3

### Provisions concerning carriage in bulk

#### 7.3.1 General provisions

##### 7.3.1.1 Goods may not be carried in bulk in bulk containers, containers or wagons unless:

- (a) either a special provision, identified by the code "BK", explicitly authorizing this mode of carriage is indicated in column (10) of Table A of Chapter 3.2 and the relevant conditions of 7.3.2 are satisfied in addition to those of this section; or
- (b) a special provision, identified by the code "VW", explicitly authorizing this mode of carriage is indicated in column (17) of Table A of Chapter 3.2 and the conditions of this special provision, as laid down in 7.3.3 are satisfied in addition to those of this section.

Nevertheless, empty packagings, uncleaned, may be carried in bulk if this mode of carriage is not explicitly prohibited by other provisions of RID.

Unless otherwise provided in the special provisions in 7.3.3, the receptacle requirements for packages shall apply to small containers intended for the carriage of substances in bulk.

**NOTE:** For carriage in tanks, see Chapters 4.2 and 4.3.

##### 7.3.1.2 Substances which may become liquid at temperatures likely to be encountered during carriage, are not permitted for carriage in bulk.

##### 7.3.1.3 Bulk containers, containers or bodies of wagons shall be siftproof and shall be so closed that none of the contents can escape under normal conditions of carriage including the effect of vibration, or by changes of temperature, humidity or pressure.

##### 7.3.1.4 Bulk solids shall be loaded and evenly distributed in a manner that minimises movement that could result in damage to the bulk container, container or wagon or leakage of the dangerous goods.

##### 7.3.1.5 Where venting devices are fitted they shall be kept clear and operable.

##### 7.3.1.6 Bulk solids shall not react dangerously with the material of the bulk container, container, wagon, gaskets, equipment including lids and tarpaulins and with protective coatings which are in contact with the contents or significantly weaken them. Bulk containers, containers or wagons shall be so constructed or adapted that the goods cannot penetrate between wooden floor coverings or come into contact with those parts of the bulk container, container or wagon that may be affected by the materials or residues thereof.

##### 7.3.1.7 Before being filled and handed over for carriage, each bulk container, container or wagon shall be inspected and cleaned to ensure that it does not contain any residue on the interior or exterior of the bulk container, container or wagon that could:

- cause a dangerous reaction with the substance intended for carriage;
- detrimentally affect the structural integrity of the bulk container, container or wagon; or
- affect the dangerous goods retention capabilities of the bulk container, container or wagon.

##### 7.3.1.8 During carriage, no dangerous residues shall adhere to the outer surfaces of bulk containers, containers or of the bodies of wagons.

##### 7.3.1.9 If several closure systems are fitted in series, the system which is located nearest to the substance to be carried shall be closed first before filling.

##### 7.3.1.10 Empty bulk containers, containers or wagons which have carried a dangerous solid substance in bulk shall be treated in the same manner as is required by RID for a filled bulk container, container or wagon, unless adequate measures have been taken to nullify any hazard.

##### 7.3.1.11 If bulk containers, containers or wagons are used for the carriage in bulk of goods liable to cause a dust explosion, or evolve flammable vapours (e.g. for certain wastes) measures shall be taken to exclude sources of ignition and prevent dangerous electrostatic discharge during carriage, filling or discharge of the substance.

##### 7.3.1.12 Substances, for example wastes, which may react dangerously with one another and substances of different classes and goods not subject to RID, which are liable to react dangerously with one another shall not be mixed together in the same bulk container, container or wagon. Dangerous reactions are:

- (a) combustion and/or evolution of considerable heat;
- (b) emission of flammable and/or toxic gases;
- (c) formation of corrosive liquids; or
- (d) formation of unstable substances.

- 7.3.1.13** Before a bulk container, container or wagon is filled it shall be visually examined to ensure it is structurally serviceable, its interior walls, ceiling and floors are free from protrusions or damage and that any inner liners or substance retaining equipment are free from rips, tears or any damage that would compromise its cargo retention capabilities. Structurally serviceable, where relevant to the means of transport concerned, means the bulk container, container or wagon does not have major defects in its structural components, such as top and bottom side rails, top and bottom end rails, door sill and header, floor cross members, corner posts, and corner fittings of a bulk container or container. Major defects, where relevant to the means of transport concerned, include:
- (a) bends, cracks or breaks in the structural or supporting members that affect the integrity of the bulk container, container or of the body of the wagon;
  - (b) more than one splice or an improper splice (such as a lapped splice) in top or bottom end rails or door headers;
  - (c) more than two splices in any one top or bottom side rail;
  - (d) any splice in a door sill or corner post;
  - (e) door hinges and hardware that are seized, twisted, broken, missing, or otherwise inoperative;
  - (f) gaskets and seals that do not seal;
  - (g) any distortion of the overall configuration of a bulk container or container great enough to prevent proper alignment of handling equipment, mounting and securing on a chassis or wagon or vehicle, or insertion into ships' cells;
  - (h) any damage to lifting attachments or handling equipment interface features; or
  - (i) any damage to service or operational equipment.
- 7.3.2 Additional provisions for the carriage in bulk when the provisions of 7.3.1.1 (a) are applied**
- 7.3.2.1** The codes "BK1" and "BK2" in column (10) of Table A of Chapter 3.2 have the following meanings:
- BK1: Carriage in bulk in sheeted bulk containers is permitted;
- BK2: Carriage in bulk in closed bulk containers is permitted.
- 7.3.2.2** The bulk container used shall conform to the requirements of Chapter 6.11.
- 7.3.2.3 Goods of Class 4.2**
- The total mass carried in a bulk container shall be such that its spontaneous ignition temperature is greater than 55°C.
- 7.3.2.4 Goods of Class 4.3**
- These goods shall be carried in bulk containers which are watertight.
- 7.3.2.5 Goods of Class 5.1**
- Bulk containers shall be so constructed or adapted that the goods cannot come into contact with wood or any other incompatible material.
- 7.3.2.6 Goods of Class 6.2**
- 7.3.2.6.1 Animal material of Class 6.2**
- Animal material containing infectious substances (UN Nos. 2814, 2900 and 3373) is authorized for carriage in bulk containers provided the following conditions are met:
- (a) **Sheeted** bulk containers BK1 are permitted provided that they are not filled to maximum capacity to avoid substances coming into contact with the sheeting. Closed bulk containers BK2 are also permitted;
  - (b) Closed and sheeted bulk containers, and their openings, shall be leak-proof by design or by the fitting of a suitable liner;
  - (c) **The animal material** shall be thoroughly treated with an appropriate disinfectant before loading prior to carriage;
  - (d) **Sheeted bulk containers** shall be covered by an additional top liner weighted down by absorbent material treated with an appropriate disinfectant;
  - (e) Closed or sheeted bulk **containers shall** not be re-used until after they have been thoroughly cleaned and disinfected.
- NOTE:** Additional provisions may be required by appropriate national health authorities.

**7.3.2.6.2 Wastes of Class 6.2 (UN 3291)**

- (a) (Reserved);
- (b) Closed bulk containers and their openings shall be leakproof by design. These bulk containers shall have non porous interior surfaces and shall be free from cracks or other features which could damage packagings inside, impede disinfection or permit inadvertent release;
- (c) Wastes of UN No. 3291 shall be contained within the closed bulk container in UN type tested and approved sealed leakproof plastics bags tested for solids of packing group II and marked in accordance with 6.1.3.1. Such plastics bags shall be capable of passing the tests for tear and impact resistance according to ISO 7765-1:1988 "Plastics film and sheeting – Determination of impact resistance by the free-falling dart method – Part 1: Staircase methods" and ISO 6383-2:1983 "Plastics – Film and sheeting – Determination of tear resistance – Part 2: Elmendorf method". Each bag shall have an impact resistance of at least 165 g and a tear resistance of at least 480 g in both parallel and perpendicular planes with respect to the length of the bag. The maximum net mass of each plastics bag shall be 30 kg;
- (d) Single articles exceeding 30 kg such as soiled mattresses may be carried without the need for a plastics bag when authorized by the competent authority;
- (e) Wastes of UN No. 3291 which contain liquids shall only be carried in plastics bags containing sufficient absorbent material to absorb the entire amount of liquid without it spilling in the bulk container;
- (f) Wastes of UN No. 3291 containing sharp objects shall only be carried in UN type tested and approved rigid packagings meeting the provisions of packing instructions P621, IBC620 or LP621;
- (g) Rigid packagings specified in packing instructions P621, IBC620 or LP621 may also be used. They shall be properly secured to prevent damage during normal conditions of carriage. Wastes carried in rigid packagings and plastics bags together in the same closed bulk container shall be adequately segregated from each other, e.g. by suitable rigid barriers or dividers, mesh nets or otherwise securing, such that they prevent damage to the packagings during normal conditions of carriage;
- (h) Wastes of UN No. 3291 in plastics bags shall not be compressed in a closed bulk container in such a way that bags may be rendered no longer leakproof;
- (i) The closed bulk container shall be inspected for leakage or spillage after each journey. If any wastes of UN No. 3291 have leaked or been spilled in the closed bulk container, it shall not be re-used until after it has been thoroughly cleaned and, if necessary, disinfected or decontaminated with an appropriate agent. No other goods shall be carried together with UN No. 3291 other than medical or veterinary wastes. Any such other wastes carried in the same closed bulk container shall be inspected for possible contamination.

**7.3.2.7 Material of Class 7**

For the carriage of unpackaged radioactive material, see 4.1.9.2.3.

**7.3.2.8 Goods of Class 8**

These goods shall be carried in bulk containers which are watertight.

**7.3.3 Special provisions for carriage in bulk when the provisions of 7.3.1.1 (b) are applied**

When an alphanumeric code beginning with "VW" is shown under an entry in column (17) of Table A of Chapter 3.2, the following special provisions apply:

- VW 1** Carriage in bulk in closed wagons, movable-roof wagons, sheeted wagons, closed containers or in sheeted large containers is permitted.
- VW 2** Carriage in bulk is permitted in movable-roof wagons with a metal body, closed large metal containers and in wagons or large containers with a metal body covered with a non-combustible sheet.
- VW 3** Carriage in bulk is permitted in sheeted wagons or sheeted large containers with adequate ventilation or in movable-roof wagons. Suitable measures shall be taken to ensure that none of the contents, particularly any liquid components, can escape.
- VW 4** Carriage in bulk is permitted in sheeted metal wagons, movable-roof metal wagons, closed metal containers or in sheeted large metal containers. For UN Nos. 2008, 2009, 2210, 2545, 2546, 2881, 3189 and 3190, only carriage in bulk of solid waste is permitted.
- VW 5** Carriage in bulk is permitted in specially equipped wagons and containers. The receptacles of specially equipped wagons and containers and their closures shall conform to the general packing conditions of 4.1.1.1, 4.1.1.2 and 4.1.1.8. Openings designed for loading and unloading shall be capable of being hermetically closed.
- VW 6** Carriage in bulk is permitted in movable-roof wagons or in closed large containers.

**VW 7** Carriage in bulk in closed wagons, sheeted wagons, movable-roof wagons, closed containers or in sheeted large containers is permitted only if the substance is in pieces.

**VW 8** Carriage in bulk is permitted in open wagons or containers covered with an impermeable and non-combustible sheet, or in movable-roof wagons or in closed containers.

Wagons and containers shall be so constructed either that the substances contained cannot come into contact with wood or any other combustible material, or that the entire surface of the floor and walls, if made of wood or another combustible material has been provided with an impermeable surfacing resistant to combustion or has been coated with sodium silicate or a similar substance.

**VW 9** Carriage in bulk is permitted in sheeted wagons or in sheeted large containers, movable-roof wagons or in closed containers.

For substances of Class 8, wagons and containers shall be equipped with a suitable and sufficiently stout inner lining.

**VW 10** Carriage in bulk is permitted in sheeted wagons, sheeted large containers, movable-roof wagons or in closed containers. Wagons and containers shall be leakproof or rendered leakproof, for example by means of a suitable, sufficiently stout inner lining.

**VW 11** Carriage in bulk is permitted in specially equipped wagons and containers. The receptacles of specially equipped wagons and containers shall be so constructed that the openings designed for loading and unloading can be closed hermetically. Substances shall be filled in the receptacles in a manner which avoids risks to humans, animals and the environment.

**VW 12** Substances for which carriage in tank-wagons, in portable tanks or in tank-containers is unsuitable because of the high temperature and density of the substance may be carried in special wagons or containers in accordance with standards specified by the competent authority of the country of origin. If the country of origin is not a COTIF Member State, the conditions laid down shall be recognized by the competent authority of the first COTIF Member State reached by the consignment.

**VW 13** Carriage in bulk is permitted in specially equipped wagons or large containers in accordance with standards specified by the competent authority of the country of origin. If the country of origin is not a COTIF Member State, the conditions laid down shall be recognized by the competent authority of the first COTIF Member State reached by the consignment.

**VW 14** (1) Used batteries may be carried in bulk in specially equipped wagons or containers. Large plastics containers shall not be permitted. Small plastics containers shall be capable of withstanding, when fully loaded, a drop from a height of 0.8 m onto a hard surface at -18 °C, without breakage.

(2) The load compartments of wagons or containers shall be of steel resistant to the corrosive substances contained in the batteries. Less resistant steels may be used when there is a sufficiently great wall thickness or a plastics lining/layer resistant to the corrosive substances. The design of the load compartments of wagons or containers shall take account of any residual currents and impact from the batteries.

**NOTE:** Steel exhibiting a maximum rate of progressive reduction of 0.1 mm per year under the effects of the corrosive substances may be considered as resistant.

(3) It shall be ensured by means of constructional measures that there will be no leakage of corrosive substances from the load compartments of wagons or containers during carriage. Open load compartments shall be covered. The cover shall be resistant to the corrosive substances.

(4) Before loading, the load compartments of wagons or containers, including their equipment, shall be inspected for damage. Wagons or containers with damaged load compartments shall not be loaded.

The load compartments of wagons or containers shall not be loaded above the top of their walls.

(5) No batteries containing different substances and no other goods liable to react dangerously with each other shall be present in the load compartments of wagons or containers (see "dangerous reaction" in 1.2.1).

During carriage no dangerous residue of the corrosive substances contained in the batteries shall adhere to the outer surface of the load compartments of wagons or containers.

**VW 15** Carriage in bulk is permitted in closed wagons, movable-roof wagons, sheeted wagons, closed containers or sheeted large containers for substances or mixtures (such as preparations or wastes) containing not more than 1000 mg/kg of substance to which this UN No is assigned.

The bodies of wagons or containers shall be leakproof or rendered leakproof, for example by means of a suitable and sufficiently stout inner lining.

**VW 16** Carriage in bulk is permitted in accordance with the provisions of 4.1.9.2.3.

**VW 17** Carriage in bulk of SCO-I is permitted in accordance with the provisions of 4.1.9.2.3.

## **Chapter 7.4**

### **Provisions concerning carriage in tanks**

Dangerous goods may only be carried in tanks when a code is shown in column (10) or (12) of Table A of Chapter 3.2, or when a competent authority has issued an authorisation in accordance with the conditions specified in 6.7.1.3. The requirements of Chapter 4.2 or 4.3 shall be observed during carriage.

## Chapter 7.5

### Provisions concerning loading, unloading and handling

**NOTE:** Within the meaning of this section, placing a container, bulk-container, tank-container, portable tank or road vehicle onto a wagon is considered as loading, and removing it is considered as unloading.

#### 7.5.1 General provisions

**7.5.1.1** The requirements in force at the forwarding station shall be complied with for the loading of goods, **provided they do not conflict with the requirements of this Chapter.**

**7.5.1.2** The loading shall not be carried out if:

- an examination of the documents or
- a visual inspection of the wagon or of the large container(s), bulk container(s), tank-container(s), portable tank(s) or road vehicle(s), if any, as well as of their equipment used in loading and unloading, shows that the wagon, a large container, a bulk-container, a tank-container, a portable tank, a road vehicle or their equipment do not comply with the regulatory provisions.

**7.5.1.3** The unloading shall not be carried out if the above-mentioned inspections reveal deficiencies that might affect the safety or the security of the unloading.

The interior and exterior of a wagon or container shall be inspected prior to loading to ensure that there is no damage that could affect its integrity or that of the packages to be loaded in it.

**7.5.1.4** In accordance with the provisions of 7.5.11 and in conformity with column (18) of Table A of Chapter 3.2, certain dangerous goods shall only be forwarded as a wagon load or full load.

**7.5.1.5** When orientation arrows are required packages shall be oriented in accordance with such markings.

**NOTE:** Liquid dangerous goods shall be loaded below dry dangerous goods whenever practicable.

#### 7.5.2 Mixed loading prohibition

**7.5.2.1** Packages bearing different danger labels shall not be loaded together in the same wagon or container unless mixed loading is permitted according to the following Table based on the danger labels they bear.

The mixed loading prohibitions for packages shall also apply to the mixed loading of packages and small containers and the mixed loading of small containers in a wagon or large container in which small containers are carried.

**NOTE:** In accordance with 5.4.1.4.2, separate transport documents shall be drawn up for consignments that cannot be loaded together in the same wagon or container.

Labels Nos.	1	1.4	1.5	1.6	2.1, 2.2, 2.3	3	4.1	4.1 + 1	4.2	4.3	5.1	5.2	5.2 + 1	6.1	6.2	7A, 7B, 7C	8	9

9	(b)	(a),(b),(c)	(b)	(b)	X	X	X		X	X	X	X		X	X	X	X	X

x Mixed loading permitted.

- (a) Mixed loading permitted with 1.4S substances and articles.
- (b) Mixed loading permitted between goods of Class 1 and life-saving appliances of Class 9 (UN Nos. 2990, 3072 and 3268).
- (c) Mixed loading permitted between air bag inflators, or air bag modules, or seat-belt pretensioners of Division 1.4, compatibility group G, (UN No. 0503) and air bag inflators or air bag modules or seat-belt pretensioners of Class 9 (UN No. 3268).
- (d) Mixed loading permitted between blasting explosives (except UN No. 0083 explosive, blasting, type C) and ammonium nitrate (UN Nos. 1942 and 2067) and alkali metal nitrates (e.g. UN No. 1486) and alkali earth metal nitrates (e.g. UN No. 1454) provided the aggregate is treated as blasting explosives under Class 1 for the purposes of placarding, segregation, stowage and maximum permissible load.

**7.5.2.2**

Packages containing substances or articles of Class 1, bearing a label conforming to models Nos. 1, 1.4, 1.5 or 1.6 which are assigned to different compatibility groups shall not be loaded together in the same wagon or container, unless mixed loading is permitted in accordance with the following Table for the corresponding compatibility groups.

Compatibility Group	B	C	D	E	F	G	H	J	L	N	S
<b>B</b>	X		(a)								X
<b>C</b>		X	X	X		X				(b), (c)	X
<b>D</b>	(a)	X	X	X		X				(b), (c)	X
<b>E</b>		X	X	X		X				(b), (c)	X
<b>F</b>					X						X
<b>G</b>		X	X	X		X					X
<b>H</b>							X				X
<b>J</b>								X			X
<b>L</b>									(d)		
<b>N</b>		(b), (c)	(b), (c)	(b), (c)						(b)	X
<b>S</b>	X	X	X	X	X	X	X	X		X	X

x Mixed loading permitted.

- (a) Packages containing articles of compatibility group B and those containing substances or articles of compatibility group D may be loaded together in one wagon or in one container provided they are effectively segregated such that there is no danger of transmission of detonation from the articles of compatibility group B to the substances or articles of compatibility group D. Segregation shall be achieved by the use of separate compartments or by placing one of the two types of explosive in a special containment system. Either method of segregation shall be approved by the competent authority.
- (b) Different types of articles of division 1.6, compatibility group N, may be carried together as articles of division 1.6, compatibility group N, only when it is proven by testing or analogy that there is no additional risk of sympathetic detonation between the articles. Otherwise they should be treated as hazard division 1.1.
- (c) When articles of compatibility group N are carried with substances or articles of compatibility groups C, D or E, the articles of compatibility group N should be considered as having the characteristics of compatibility group D.
- (d) Packages containing substances and articles of compatibility group L may be loaded together in one wagon or in one container with packages containing the same type of substances and articles of that compatibility group.

**7.5.2.3**

(Reserved)

**7.5.3****Protective distance**

Every wagon or large container containing substances or articles of Class 1 and bearing a label conforming to models Nos. 1, 1.5 or 1.6, shall be separated on the same train from wagons or large containers bearing a label conforming to models Nos. 2.1, 3, 4.1, 4.2, 4.3, 5.1 or 5.2 by a protective distance.

The requirement for this protective distance is met if the space between the buffer head of a wagon or the end wall of a large container and the buffer head of another wagon or the end wall of another large container is:

- (a) at least 18 m, or
- (b) occupied by two 2-axle wagons or a wagon with 4 or more axles.

**7.5.4 Precautions with respect to foodstuffs, other articles of consumption and animal feeds**

If special provision CW28 is indicated for a substance or article in column (18) of Table A of Chapter 3.2, precautions with respect to foodstuffs, other articles of consumption and animal feeds shall be taken as follows:

Packages as well as uncleaned empty packagings, including large packagings and intermediate bulk containers (IBCs), bearing labels conforming to models Nos. 6.1 or 6.2 and those bearing labels conforming to model No. 9 containing goods of UN Nos. 2212, 2315, 2590, 3151, 3152 or 3245, shall not be stacked on or loaded in immediate proximity to packages known to contain foodstuffs, other articles of consumption or animal feeds in wagons, in containers and at places of loading, unloading or transshipment.

When these packages, bearing the said labels, are loaded in immediate proximity of packages known to contain foodstuffs, other articles of consumption or animal feeds, they shall be kept apart from the latter:

- (a) by complete partitions which should be as high as the packages bearing the said labels;
- (b) by packages not bearing labels conforming to models Nos. 6.1, 6.2 or 9 or packages bearing labels conforming to model No.9 but not containing goods of UN Nos. 2212, 2315, 2590, 3151, 3152 or 3245; or
- (c) by a space of at least 0.8 m;

unless the packages bearing the said labels are provided with an additional packaging or are completely covered (e.g. by a sheeting, a fibreboard cover or other measures).

**7.5.5** (Reserved)

**7.5.6** (Reserved)

**7.5.7 Handling and stowage**

**7.5.7.1** Where appropriate the wagon or container shall be fitted with devices to facilitate securing and handling of the dangerous goods. Packages containing dangerous substances and unpackaged dangerous articles shall be secured by suitable means capable of restraining the goods (such as fastening straps, sliding slat-boards, adjustable brackets) in the wagon or container in a manner that will prevent any movement during carriage which would change the orientation of the packages or cause them to be damaged. When dangerous goods are carried with other goods (e.g. heavy machinery or crates), all goods shall be securely fixed or packed in the wagons or containers so as to prevent the release of dangerous goods. Movement of packages may also be prevented by filling any voids by the use of dunnage or by blocking and bracing. Where restraints such as banding or straps are used, these shall not be over-tightened to cause damage or deformation of the package.

**7.5.7.2** Packages shall not be stacked unless designed for that purpose. Where different design types of packages that have been designed for stacking are to be loaded together, consideration shall be given to their compatibility for stacking with each other. Where necessary, stacked packages shall be prevented from damaging the package below by the use of load-bearing devices.

**7.5.7.3** During loading and unloading, packages containing dangerous goods shall be protected from being damaged.

**NOTE:** Particular attention shall be paid to the handling of packages during their preparation for carriage, the type of wagon or container on which they are to be carried and to the method of loading or unloading, so that accidental damage is not caused through dragging or mishandling the packages.

**7.5.8 Cleaning after unloading**

**7.5.8.1** If, when a wagon or container which has contained packaged dangerous goods is unloaded, some of the contents are found to have escaped, the wagon or container shall be cleaned as soon as possible and in any case before reloading.

If it is not possible to do the cleaning locally, the wagon or container shall be carried, with due regard to adequate safety, to the nearest suitable place where cleaning can be carried out.

Carriage is adequately safe if suitable measures have been taken to prevent the uncontrolled release of the dangerous goods that have escaped.

**7.5.8.2** Wagons or containers which have been loaded with dangerous goods in bulk shall be properly cleaned before reloading unless the new load consists of the same dangerous goods as the preceding load.

**7.5.9** (Reserved)

**7.5.10** (Reserved)

**7.5.11 Additional provisions applicable to certain classes or specific goods**

In addition to the provisions of 7.5.1 to 7.5.4 and 7.5.8, the following special provisions shall apply when an alphanumeric code beginning with "CW" is shown in column (18) of Table A of Chapter 3.2.

**CW 1** Before loading, the floor of the wagon or container shall be carefully cleaned by the consignor.

No metal objects in the interior of the wagon or container other than those forming part of the construction of the wagon or container shall be allowed to protrude.

The doors and ventilator shutters of the wagons or containers shall be closed.

Packages shall be so loaded and stowed in the wagon or container that they cannot move or shift. They shall be protected against any chafing or bumping.

**CW 2** (Reserved)

**CW 3** (Reserved)

**CW 4** Substances and articles of compatibility group L shall only be carried as a full load or as a wagon load.

**CW 5** (Reserved)

**CW 6** (Reserved)

**CW 7** (Reserved)

**CW 8** (Reserved)

**CW 9** Packages shall not be thrown or subjected to impact.

**CW 10** Cylinders as defined in 1.2.1, shall be laid parallel to or at right angles to the longitudinal axis of the wagon or container; however, those situated near the forward transverse wall shall be laid at right angles to the said axis.

Short cylinders of large diameter (about 30 cm and over) may be stowed longitudinally with their valve-protecting devices directed towards the middle of the wagon or container.

Cylinders which are sufficiently stable or are carried in suitable devices effectively preventing them from overturning may be placed upright.

Cylinders which are laid flat shall be securely and appropriately wedged, attached or secured so that they cannot shift.

Receptacles designed to be rolled shall be laid with their longitudinal axis parallel to that of the wagon or container and shall be secured against any lateral movement.

**CW 11** Receptacles shall always be placed in the position for which they were designed and be protected against any possibility of being damaged by other packages.

**CW 12** When pallets loaded with articles are stacked, each tier of pallets shall be evenly distributed over the lower tier, if necessary by the interposition of a material of adequate strength.

**CW 13** If any substances have leaked and been spilled in a wagon or container, it may not be re-used until after it has been thoroughly cleaned and, if necessary, disinfected or decontaminated. Any other goods and articles carried in the same wagon or container shall be examined for possible contamination.

**CW 14** (Reserved)

**CW 15** (Reserved)

**CW 16** Consignments of UN No. 1749 chlorine trifluoride with a gross mass of more than 500 kg shall only be carried as a wagon load or as a full load and in quantities not exceeding 5000 kg per wagon or large container.

**CW 17** Packages containing substances of this Class which are to be carried at a specific ambient temperature shall only be carried as a wagon load or as a full load. The conditions of carriage shall be agreed between the consignor and the carrier.

**CW 18** Packages shall be so stowed that they are readily accessible.

**CW 19** (Reserved)

**CW 20** (Reserved)

**CW 21** (Reserved)

**CW 22** Wagons and large containers shall be thoroughly cleaned before loading.

Packages shall be loaded so that a free circulation of air within the loading space provides a uniform temperature of the load. If the contents of one wagon or large container exceed 5000 kg of these substances, the load shall be divided into stacks of not more than 5000 kg separated by air spaces of at least 0.05 m. Packages shall be protected from being damaged by other packages.

**CW 23** When handling packages, special measures shall be taken to ensure that they do not come into contact with water.

**CW 24** Before loading, wagons and containers shall be thoroughly cleaned and in particular be free of any combustible debris (straw, hay, paper, etc.).

The use of readily flammable materials for stowing packages is prohibited.

**CW 25** (Reserved)

**CW 26** The wooden parts of a wagon or container which have come into contact with these substances shall be removed and burnt.

**CW 27** (Reserved)

**CW 28** See 7.5.4.

**CW 29** Packages shall be stored upright.

**CW 30** The consignor and the carrier shall come to an agreement on the conditions of carriage before consignments are handed over for the carriage of refrigerated liquefied gases in tank-wagons, portable tanks or tank-containers fitted with safety valves.

**CW 31** Wagons or large containers which have contained substances of this Class as wagon loads or as full loads shall be checked, after unloading, for any residues of the load.

**CW 32** (Reserved)

**CW 33 NOTE** 1: "Critical group" means a group of members of the public which is reasonably homogeneous with respect to its exposure for a given radiation source and given exposure pathway and is typical of individual receiving the highest effective dose by the given exposure pathway from the given source.

2: "Members of the public" means in a general sense, any individuals in the population except when subject to occupational or medical exposure.

3: "Workers" are any persons who work, whether full time, part-time or temporarily, for an employer and who have recognised rights and duties in relation to occupational radiation protection.

#### (1) Segregation

(1.1) Packages, overpacks, containers and tanks containing radioactive material and unpackaged radioactive material shall be segregated during carriage:

(a) from workers in regularly occupied working areas:

- (i) in accordance with Table A below; or
- (ii) by distances calculated using a dose criterion of 5 mSv in a year and conservative model parameters;

**NOTE:** Workers subject to individual monitoring for the purposes of radiation protection shall not be considered for the purposes of segregation.

(b) from members of the critical group of the public, in areas where the public has regular access:

- (i) in accordance with Table A below; or
- (ii) by distances calculated using a dose criterion of 1 mSv in a year and conservative model parameters;

(c) from undeveloped photographic film and mailbags:

- (i) in accordance with Table B below; or
- (ii) by distances calculated using a radiation exposure criterion for undeveloped photographic film due to the transport of radioactive material for 0.1 mSv per consignment of such film; and

**NOTE:** Mailbags shall be assumed to contain undeveloped film and plates and therefore be separated from radioactive material in the same way.

(d) from other dangerous goods in accordance with 7.5.2.

**Table A: Minimum distances between packages of category II-YELLOW or of category III-YELLOW and persons**

Sum of transport indexes not more than	Exposure time per year (hours)			
	Areas where members of the public have regular access		Regularly occupied working areas

3	30	30	2	3	5	7	11	16	25	35
4	40	40	3	4	5	8	13	18	30	40
5	50	50	3	4	6	9	14	20	32	45

(1.2) Category II-YELLOW or III-YELLOW packages or overpacks shall not be carried in compartments occupied by passengers, except those exclusively reserved for couriers specially authorized to accompany such packages or overpacks.

(1.3) (Reserved)

## (2) Activity limits

The total activity in a wagon, for carriage of LSA material or SCO in Industrial Packages Type 1 (Type IP-1), Type 2 (Type IP-2), Type 3 (Type IP-3) or unpackaged, shall not exceed the limits shown in Table C below.

**Table C: Wagon activity limits for LSA material and SCO in industrial packages or unpackaged**

Nature of material or object	Activity limit for wagon
LSA-I	No limit
LSA-II and LSA-III non-combustible solids	No limit
LSA-II and LSA-III combustible solids, and all liquids and gases	100 A <sub>2</sub>
SCO	100 A <sub>2</sub>

**(3) Stowage during carriage and storage in transit**

- (3.1) Consignments shall be securely stowed.
- (3.2) Provided that its average surface heat flux does not exceed  $15 \text{ W/m}^2$  and that the immediately surrounding cargo is not in bags, a package or overpack may be carried or stored among packaged general cargo without any special stowage provisions except as may be specifically required by the competent authority in an applicable approval certificate.
- (3.3) Loading of containers and accumulation of packages, overpacks and containers shall be controlled as follows:
- (a) Except under the condition of exclusive use, and for consignments of LSA-I material, the total number of packages, overpacks and containers in a single wagon shall be so limited that the total sum of the transport indexes in the wagon does not exceed the values shown in Table D below.
  - (b) The radiation level under routine conditions of carriage shall not exceed  $2 \text{ mSv/h}$  at any point on, and  $0.1 \text{ mSv/h}$  at 2 m from, the external surface of the wagon, except for consignments carried under exclusive use, for which the radiation limits around the wagon are set forth in (3.5) (b) and (c);
  - (c) The total sum of the criticality safety indexes in a container and or wagon shall not exceed the values shown in Table E below.

**Table D: Transport Index limits for containers and wagons not under exclusive use**

Type of container or wagon	Limit on total sum of transport indexes in a container or wagon
Small container	50
Large container	50
Wagon	50

**Table E: Criticality Safety Index for containers and vehicles containing fissile material**

Type of container or wagon	Limit on total sum of criticality safety indexes in a container or wagon	
	Not under exclusive use	Under exclusive use
Small container	50	n.a.
Large container	50	100
Wagon	50	100

- (3.4) Any package or overpack having either a transport index greater than 10, or any consignment having a criticality safety index greater than 50, shall be carried only under exclusive use.
- (3.5) For consignments under exclusive use, the radiation level shall not exceed:
- (a)  $10 \text{ mSv/h}$  at any point on the external surface of any package or overpack, and may only exceed  $2 \text{ mSv/h}$  provided that:
    - (i) the wagon is equipped with an enclosure which, during routine conditions of carriage, prevents the access of unauthorized persons to the interior of the enclosure;
    - (ii) provisions are made to secure the package or overpack so that its position within the wagon enclosure remains fixed during routine conditions of carriage, and
    - (iii) there is no loading or unloading during the shipment;
  - (b)  $2 \text{ mSv/h}$  at any point on the outer surfaces of the wagon, including the upper and lower surfaces, or, in the case of an open wagon, at any point on the vertical planes projected from the outer edges of the wagon, on the upper surface of the load, and on the lower external surface of the wagon; and
  - (c)  $0.1 \text{ mSv/h}$  at any point 2 m from the vertical planes represented by the outer lateral surfaces of the wagon, or, if the load is carried in an open wagon, at any point 2 m from the vertical planes projected from the outer edges of the wagon.

**(4) Segregation of packages containing fissile material during carriage and storage in transit**

- (4.1) Any group of packages, overpacks, and containers containing fissile material stored in transit in any one storage area shall be so limited that the total sum of the CSIs in the group does not exceed 50. Each group shall be stored so as to maintain a spacing of at least 6 m from other such groups.
- (4.2) Where the total sum of the criticality safety indexes in a wagon or container exceeds 50, as permitted in Table E above, storage shall be such as to maintain a spacing of at least 6 m from other groups of packages, overpacks or containers containing fissile material or other wagons carrying radioactive material.

**(5) Damaged or leaking packages, contaminated packagings**

- (5.1) If it is evident that a package is damaged or leaking, or if it is suspected that the package may have leaked or been damaged, access to the package shall be restricted and a qualified person shall, as soon as possible, assess the extent of contamination and the resultant radiation level of the package. The scope of the assessment shall include the package, the wagon, the adjacent loading and unloading areas, and, if necessary, all other material which has been carried in the wagon. When necessary, additional steps for the protection of persons property and the environment, in accordance with provisions established by the competent authority, shall be taken to overcome and minimize the consequences of such leakage or damage.
- (5.2) Packages damaged or leaking radioactive contents in excess of allowable limits for normal conditions of carriage may be removed to an acceptable interim location under supervision, but shall not be forwarded until repaired or reconditioned and decontaminated.
- (5.3) A wagon and equipment used regularly for the carriage of radioactive material shall be periodically checked to determine the level of contamination. The frequency of such checks shall be related to the likelihood of contamination and the extent to which radioactive material is carried.
- (5.4) Except as provided in paragraph (5.5), any wagon, or equipment or part thereof which has become contaminated above the limits specified in 4.1.9.1.2 in the course of carriage of radioactive material, or which shows a radiation level in excess of 5  $\mu\text{Sv/h}$  at the surface, shall be decontaminated as soon as possible by a qualified person and shall not be re-used unless the non-fixed contamination does not exceed the limits specified in 4.1.9.1.2, and the radiation level resulting from the fixed contamination on surfaces after decontamination is less than 5  $\mu\text{Sv/h}$  at the surface.
- (5.5) A container, tank, intermediate bulk container or wagon dedicated to the carriage of unpackaged radioactive material under exclusive use shall be excepted from the requirements of the previous paragraph (5.4) and in 4.1.9.1.2 solely with regard to its internal surfaces and only for as long as it remains under that specific exclusive use.

**(6) Other provisions**

Where a consignment is undeliverable, the consignment shall be placed in a safe location and the competent authority shall be informed as soon as possible and a request made for instructions on further action.

- CW 34** Prior to carriage of pressure receptacles it shall be ensured that the pressure has not risen due to potential hydrogen generation.
- CW 35** If bags are used as single packagings, they shall be adequately separated to allow for the dissipation of heat.
- CW 36** Packages shall preferably be loaded in open or ventilated wagons or open or ventilated containers. If this is not feasible and packages are carried in other closed wagons or containers, the cargo doors of the wagons or containers shall be marked with the following in letters not less than 25 mm high:

"WARNING  
NO VENTILATION  
OPEN WITH CAUTION"

This shall be in a language considered appropriate by the consignor.

## Chapter 7.6

### Provisions for carriage as colis express (express goods)

In accordance with Article 5 § 1 of Appendix C to COTIF, goods are only permitted for carriage as express goods when a special provision with an alphanumeric code beginning with the letters "CE" is shown in column (19) of Table A of Chapter 3.2 specifically authorizing this form of transport, and the conditions of this special provision are complied with.

The following special provisions apply when they are shown under an entry in column (19) of Table A of Chapter 3.2.

- CE 1** An express parcels package shall not weigh more than 40 kg. Express parcels consignments may be loaded in railway wagons which can simultaneously serve for the carriage of persons, but only up to a limit of 100 kg per wagon.
- CE 2** An express parcels package shall not weigh more than 40 kg.
- CE 3** An express parcels package shall not weigh more than 50 kg.
- CE 4** An express parcels package shall not contain more than 45 litres of this substance and shall not weigh more than 50 kg.
- CE 5** An express parcels package shall not contain more than 2 litres of this substance.
- CE 6** An express parcels package shall not contain more than 4 litres of this substance.
- CE 7** An express parcels package shall not contain more than 6 litres of this substance.
- CE 8** An express parcels package shall not contain more than 12 litres of this substance.
- CE 9** An express parcels package shall not contain more than 4 kg of this substance.
- CE 10** An express parcels package shall not contain more than 12 kg of this substance.
- CE 11** An express parcels package shall not contain more than 24 kg of this substance.
- CE 12** When sent as an express parcel, the substance shall be contained in unbreakable receptacles. An express parcels package shall not weigh more than 25 kg.
- CE 13** Only inorganic cyanides containing precious metals, and mixtures of these may be sent as express parcels. In this case, combination packagings with inner packagings of glass, plastics or metal in accordance with 6.1.4.21 shall be used. An express parcels package shall not contain more than 2 kg of the substance.
- Carriage in luggage vans or luggage compartments accessible to passengers shall be authorized if, by means of appropriate measures, packages are placed out of reach of non-authorized persons.
- CE 14** Only substances which are not to be carried at a specific ambient temperature may be forwarded as express parcels. In this case, the following quantity limits shall apply:
- for substances other than those assigned to UN No. 3373 up to 50 ml per package for liquids and up to 50 g per package for solids.
  - for substances assigned to UN No. 3373 in quantities as specified in packing instruction P650 in 4.1.4.1.
  - for body parts or organs, a package shall not weigh more than 50 kg.
- CE 15** For express parcels packages, the sum of the transport indexes on the danger labels in a luggage van or luggage compartment shall not be more than 10. For packages of category III-YELLOW, the carrier may determine the time of delivery of the consignment. An express parcels package shall not weigh more than 50 kg.

## Chapter 7.7

### **Carriage of dangerous goods as hand luggage or registered luggage or in or on board motor vehicles (car on train)**

**NOTE 1:** In accordance with Article 12 § 4 of the Uniform Rules concerning the Contract of International Carriage of Passengers by Rail (CIV – Appendix A of COTIF) and Article 5 of Appendix C (RID) of COTIF, dangerous goods are only permitted as hand luggage, registered luggage or in or on board motor vehicles (car on train) in accordance with the requirements of RID.

**2:** Further restrictions in the railway undertakings' conditions of carriage under private law are not affected.

Dangerous goods may only be carried as hand luggage or registered luggage or in or on board motor vehicles (car on train) if the exemption requirements of 1.1.3.1 (a) or (b), 1.1.3.2 (b), (d) or (f), 1.1.3.3 or 1.1.3.7 are applicable for the carriage.

**Unofficial part of RID**

## Requirements for the testing of plastics receptacles

### Guidelines for 6.1.5.2.7 and 6.5.6.3.6

Laboratory methods using samples for proving chemical compatibility of polyethylene in accordance with the definition in 6.1.5.2.6 and 6.5.6.3.5 with filling substances (substances, mixtures and preparations) as compared with the standard liquids according to 6.1.6.

Carrying out laboratory methods A to C described below will enable determination of the possible deterioration mechanisms on the material of the receptacle for the substances intended to be carried, as compared with the standard liquids in each case.

The deterioration mechanisms to be expected will determine the choice of test method.

The laboratory methods will establish

- softening through swelling (laboratory method A),
- formation of stress cracking (laboratory method B),
- reaction by oxidizing and molecular degradation (laboratory method C),

in the material of the receptacle, where these cannot already be determined on the basis of the formulation, and will in each case be compared with the appropriate standard liquids with similar effects.

Test samples of the same thickness within the tolerance limits indicated shall be used.

### Laboratory method A

The increase in mass through swelling is determined using flat test samples from the receptacle material stored at 40°C in the substance intended to be carried and in the standard liquid to be compared.

The change in mass through swelling is determined by weighing the test samples before storage and if the test samples are not more than 2 mm, after a reaction period of 4 weeks, otherwise after a reaction time sufficient for the test samples to reach mass constancy.

In each case, the average value of 3 test samples shall be determined. Test samples shall only be used once.

### Laboratory method B (pin insertion procedure)

#### 1. Short description

The performance of a receptacle material made of high density polyethylene with respect to the substance intended to be carried and the appropriate standard liquid is tested using the pin impression test, to the extent that this performance can be influenced by the formation of stress cracking, with or without simultaneous swelling up to 4%.

For the test, the test samples are provided with a drilled hole and a notch, and undergo preliminary storage in the filling substance to be tested and in the appropriate standard liquid. After preliminary storage, a pin of a defined oversize is inserted into the drilled hole.

The test samples prepared thus are then stored in the filling substance to be tested and in the appropriate standard liquid and are removed after storage periods of different duration and tested for residual tensile strength (procedure 3.1) or for the length of time until the test samples crack (procedure 3.2).

By making comparative measurements with the standard liquids "wetting solution", "acetic acid", "normal butyl acetate/normal butyl acetate-saturated wetting solution" or "water" as the test substance, it can be determined whether the degree of deterioration caused by the filling substance to be tested is equal to, more than or less than that of the standard liquid.

#### 2. Test samples

##### 2.1 Form and dimensions

The form and dimensions of the test sample are shown in figure 1. The thickness of the sample should not vary by  $\pm 15\%$  of the average value within a test series.

The filling substance to be tested and the appropriate standard liquid are part of the test procedure.

**Figure 1**

Extrusionsrichtung = direction of extrusion

Probekörper ohne Stift = test sample without pin

Mindestwanddicke: 2mm = minimum wall thickness: 2mm

\* Mindestwanddicke: 2mm

## 2.2 Manufacture

The test samples of a test series may be taken from receptacles of the same design type or from the same piece of an extruded semi-finished product.

With regard to machining of test samples, the surface quality obtained by cutting with a saw is sufficient. Ridges that occur during manufacture should simply be removed from the surface which is later to be notched. The test samples shall be notched parallel to the direction of extrusion.

A hole with a diameter of 3 mm  $^{+0,03}_{-0}$  is to be drilled into each test sample as shown in Figure 1.

The test sample shall then be provided with a V notch as shown in Figure 1, with a notch radius of  $\leq 0.05$  mm.

The distance between the bottom of the notch and the perimeter of the hole shall be 5 mm  $\pm 0.1$  mm.

## 2.3 Number of test samples

To determine the residual tensile strength in accordance with paragraph 3.2, 10 test samples per storage period shall be used. As a rule, at least 5 storage periods shall be used.

In order to determine the time required until the test samples crack in accordance with paragraph 3.3, a total of 15 samples is required.

## 2.4 Pins

See Figure 2 for the dimensions of the 4 mm thick pins.

**Figure 2**

- a: Pin to determine residual tensile strength                      b: Pin to determine the standing time until the test sample cracks

poliert = polished

Steigung = gradient

Material: Nichtrostender Sonderstahl = Material: stainless (rust-resistant) steel

The preferred material for the pin is stainless steel (e.g. X 12 Cr Si 17).

For substances which can corrode this steel, glass pins shall be used.

### 3. Test procedure and evaluation

#### 3.1 Preliminary storage of the samples

Before having the pin inserted, the test samples shall undergo preliminary storage for 21 days at  $40^{\circ}\text{C} \pm 1^{\circ}\text{C}$  in the test liquids and standard liquids. For standard liquid c) in accordance with 6.1.6.1, preliminary storage shall be in n-butyl acetate.

#### 3.2 Procedure to determine the residual tensile strength curve

##### 3.2.1 Method

The pin in accordance with Figure 2a is inserted into the drilled hole in the test samples past the tapered part on to the cylindrical section.

The samples prepared thus are then immersed in storage receptacles filled with the respective test liquid, thermally conditioned to a temperature of  $40^{\circ}\text{C}$ , and then stored in an oven at  $40^{\circ}\text{C} \pm 1^{\circ}\text{C}$ . For standard liquid c), this test is carried out using wetting solution with the addition of 2% n-butyl acetate.

The period of time between inserting the pin into the test samples and continuing the storage in the test liquid must be uniformly selected and kept constant for a test series.

The storage periods for determining the time and test liquid related formation of stress cracking shall be selected such that a clear differentiation can be demonstrated between the residual tensile strength curves of the standard liquids tested and the filling substances to be classified with sufficient certainty.

After being removed from the storage receptacle, the pins shall immediately be removed from the test samples and any residual test liquid shall be cleaned off.

After being cooled to room temperature, the test samples shall be split parallel to the notched side through the middle of the drilled hole using a saw cut. Only the notched parts of the test samples shall be used for further testing.

These notched test samples shall then, no later than 8 hours after being removed from the test liquid, be subjected in a tensile testing machine to a uniaxial tensile stress, at a test speed (speed of the moving clamp) of 20 mm/min, until they break. The maximum strength shall be determined. The tensile test shall be carried out at room temperature ( $23^{\circ}\text{C} \pm 2^{\circ}\text{C}$ ) in accordance with ISO/R 527.

### 3.2.2 Evaluation

The evaluation to determine the effect of the test liquid comprises calculation of the maximum tensile strength of the pre-stored test sample parts without the pin as the zero value, and the maximum tensile strength of the sample after the storage periods  $t_y$  where  $y \geq 5$  (days). After converting these maximum tensile strength values at  $t_y$  into %, compared to the zero value, these values are plotted on a graph as in Figure 3.

A comparison with the corresponding residual tensile strength curves from measurements using the standard liquids "wetting solution" or "acetic acid" or "n-butyl acetate/n-butyl acetate-saturated wetting solution" or "water" then shows whether the filling substance tested has a stronger, weaker or no effect on the same receptacle material (see Figure 3).

**Figure 3**

Spannungsrißprüfung (Stifteindrückmethode) = stress cracking test (pin impression method)

Füllgut = filling substance

Standardflüssigkeit = standard liquid

Aggressiver = more aggressive

Weniger aggressiv als = less aggressive than

Restzugfestigkeitskurven = residual tensile strength curves

Standzeit bis zum Durchreißen der Probekörper = time until the test samples crack

Tage = days

### 3.3 Procedure to determine the time until the test samples crack

#### 3.3.1 Method

15 pins are fully inserted into 15 individual upright test samples in accordance with diagram 2b, which are then placed into a glass tube thermally conditioned to 40°C and filled with the test liquid.

The test temperature is kept constant  $\pm 1^\circ\text{C}$ . The cracking of the test samples on each pin is ascertained by visual observation. Experience shows that the crack always grows from the base of the notch to the surface of the pin.

### 3.3.2 Evaluation

The elapsed time  $T_{SF}$  with the standard liquid until 8 samples have cracked is decisive for the assessment. It is not necessary to wait for any further cracks to form.

The evaluation is carried out by comparing with the number of samples that cracked using the filling substance. There shall be no more than 8 samples that crack during the time  $T_{SF}$ .

### 3.4 Comment

For this test procedure, the test parameters "storage temperature" and "distance between the bottom of the notch and perimeter of the hole" were selected in such a way that in corresponding tests with the standard liquids "wetting solution", "acetic acid" and "normal butyl acetate/normal butyl acetate-saturated wetting solution", meaningful results in the context of this test procedure can be obtained within an overall test duration of about 28 days. In this case, a high molecular mass polyethylene with a density of  $\sim 0.952 \text{ g/cm}^3$  and a Melt Flow Rate (MFR  $190^\circ\text{C}/21.6 \text{ kg load}$ ) of  $\sim 2.0 \text{ g/10 min}$  was taken as a basis.

As the conclusion of this test procedure should always be a relative conclusion, it is also possible to modify the relative values of the test parameters above in order to reduce the period required for the test. This information must be specified in the test report.

## 4. Criteria for a satisfactory test result

- 4.1 The test result according to laboratory method A shall not exceed 1% increase in mass through swelling if standard liquid a), "wetting solution" or standard liquid b), "acetic acid" is to be used for making a comparison.

The test result according to laboratory method A with the filling substance being tested shall not exceed the increase in mass through swelling obtained with normal butyl acetate (about 4%) if standard liquid c), "normal butyl acetate/normal butyl acetate-saturated wetting solution" is to be used for making a comparison.

- 4.2 The test result according to laboratory method B shall yield the same or a longer standing time for the filling substance than that for the standard liquids used for the comparison.

### Laboratory method C

In order to assess whether the filling substance poses a potential risk of oxidation or molecular degradation for a receptacle material made of high density polyethylene in accordance with 6.1.5.2.6 and 6.5.6.3.5 respectively, the Melt Flow Rate (MFR  $190^\circ\text{C}/21.6 \text{ kg load}$  in accordance with ISO 1133 – Condition 7) of test samples with a thickness range equivalent to the design type, shall be determined before and after storage of these samples in the filling substance to be assessed.

By storing geometrically identical samples in the standard liquid "55% nitric acid" in accordance with 6.1.6.1 (e) and by means of melt flow rate data, it shall be ascertained whether the degree of degradation caused by the filling substance to the material of the receptacle is less, equal or greater.

Samples shall be stored at  $40^\circ\text{C}$  until it is possible to make a final assessment, up to a maximum of 42 days.

If the filling substance to be approved produces swelling with an increase in mass of  $\geq 1\%$  in accordance with laboratory method A, in order not to affect the result of the measurement, the sample shall be "post-dried" whilst simultaneously checking the mass before the melt flow rate is measured, e.g. by storage in a vacuum drying cabinet at  $50^\circ\text{C}$  until mass constancy is reached, as a rule for not more than 7 days.

Criterion for a satisfactory test result:

The increase in the melt flow rate of the receptacle material caused by the filling substance to be approved shall not be greater than the change caused by the standard liquid "55% nitric acid", including a tolerance limit of 15% necessitated by the test method.

### *1. cikk*

#### **Hatály**

1. § Ezt a Szabályzatot kell alkalmazni
- a)* a veszélyes áruknak a tagállamok területén történő nemzetközi vasúti fuvarozására,
  - b)* a CIM Egységes Szabályok hatálya alá tartozó, a vasúti fuvarozást kiegészítő fuvarozásra, az egyéb közlekedési móddal történő szállításra vonatkozó nemzetközi előírások betartásával, valamint a jelen Szabályzat Mellékletében említett tevékenységekre.
2. § Azok a veszélyes áruk, amelyeket a Melléklet a fuvarozásból kizár, nem képezhetik nemzetközi fuvarozás tárgyát.

### *2. cikk*

#### **Mentesség**

A jelen Szabályzatot - részben vagy egészében - nem kell alkalmazni azokra a veszélyes árukra, amelyekre a Melléklet mentességet állapít meg. Mentesség csak akkor állapítható meg, ha az áru mennyisége, természete vagy csomagolása garantálja a fuvarozás biztonságát.

### *3. cikk*

#### **Korlátozások**

A tagállamok fenntartják maguknak azt a jogot, hogy veszélyes áruknak a saját területükön való nemzetközi fuvarozását, a fuvarozás biztonságán kívül, egyéb okokból is szabályozhassák vagy megtilthassák.

### *4. cikk*

#### **Egyéb előírások**

A jelen Szabályzat hatálya alá tartozó fuvarozásra a vasúti áru fuvarozásra általában vonatkozó nemzeti, illetve nemzetközi előírások továbbra is érvényesek.

*5. cikk***Engedélyezett vonattípusok. Kézipoggyászként, útipoggyászként vagy  
gépjárműben való szállítás**

1. § Veszélyes áru csak tehervonaton fuvarozható, kivéve

*a)* a Melléklet szerint fuvarozásra felvehető olyan veszélyes árut, amelyek a nem tehervonattal történő fuvarozásra vonatkozó legnagyobb mennyiségi és különleges fuvarozási feltételeknek megfelelnek;

*b)* a Melléklet különleges előírásai szerint, a CIV Egységes Szabályok 12. cikkének megfelelően kézipoggyászként, útipoggyászként, illetve gépjárműben szállított veszélyes árut.

2. § Az utas veszélyes árut nem vihet magával kézipoggyászként, nem adhat fel útipoggyászként vagy gépjárműben, ha az áru nem felel meg a Melléklet különleges előírásainak.

*6. cikk***Melléklet**

A Melléklet a jelen Szabályzat szerves részét képezi.

**A Veszélyes Áruk Nemzetközi Vasúti Fuvarozásáról szóló  
Szabályzat (RID)**

**1. Rész**  
**Általános előírások**

## 1.1 fejezet

### Hatály és alkalmazási terület

#### 1.1.1 Szerkezet

A RID hét részre van osztva, minden rész fejezetekből áll és minden fejezet szakaszokat és bekezdéseket tartalmaz.

Az egyes részekben belül a rész sorszáma kapcsolódik az egyes fejezetek, szakaszok és bekezdések sorszámaához; például a 4. rész, 2. fejezet, 1. szakaszának számozása: „4.2.1”.

#### 1.1.2 Hatály

A C Függelék 1. cikke szerint a RID meghatározza:

- a) azokat a veszélyes árukat, amelyek a nemzetközi fuvarozásból ki vannak zárva;
- b) azokat a veszélyes árukat, amelyek nemzetközi fuvarozása engedélyezett és a fuvarozásukhoz előírt feltételeket (beleértve a mentességeket), különösen:
  - az áruk besorolását (osztályozását), beleértve a besorolási kritériumokat és a vonatkozó vizsgálati módszereket;
  - a csomagolóeszközök használatát (beleértve az egybecsomagolást);
  - a tartányok használatát (beleértve azok töltését);
  - a feladási eljárásokat (beleértve a küldeménydarabok jelölését és bárcázását, a szállítóeszközök jelölését és táblázását, valamint a szükséges okmányokat és információkat);
  - a csomagolóeszközök és tartányok gyártására, vizsgálatára és jóváhagyására vonatkozó előírásokat;
  - a szállítóeszközök használatát (beleértve a berakást, az együvé rakást és a kirakást).

A RID értelmében vett fuvarozásokra – a C Függeléken kívül – a COTIF többi függelékének vonatkozó előírásai is érvényesek, különösen a szerződés alapján végzett fuvarozásokra vonatkozóan a B Függelék előírásai.

#### 1.1.3 Mentességek

##### 1.1.3.1 *A fuvarozás jellegéből adódó mentességek*

A RID előírásait nem kell alkalmazni:

- a) a magánszemélyek által történő veszélyes áru szállításra, amennyiben az áru kiskereskedelmi csomagolásban van és személyes vagy háztartási használatra, továbbá szabadidő vagy sport célokra szolgál, feltéve, hogy a veszélyes áru normális szállítási feltételek melletti kiszabadulásának megakadályozására szükséges intézkedéseket megtették. Amennyiben ez az áru magánszemély által vagy magánszemély részére megtöltött, újratölthető tartályokban szállított gyúlékony folyékony anyag, akkor az összmennyiség egy tartályban legfeljebb 60 liter lehet. Az IBC, a nagycsomagolás, ill. a tartály nem tekinthető kiskereskedelmi csomagolásnak.;

- b) a RID-ben nem szereplő gépek és készülékek szállítására, amelyek szerkezetükben vagy működtető elemeikben veszélyes árut tartalmaznak, feltéve, hogy a veszélyes áru normális szállítási feltételek melletti kiszabadulásának megakadályozására szükséges intézkedéseket megtették;
- c) a vállalatok (vállalkozások) olyan szállításaira, ami fő tevékenységükkel kapcsolatos, mint például a mély- és magasépítési munkaterületek ellátása, vagy méréssel, javítással és karbantartással kapcsolatos szállítások, ill. visszaszállítások küldeménydarabonként legfeljebb 450 liter mennyiségű veszélyes áru esetén és az 1.1.3.6 bekezdésben meghatározott mennyiségi határokon belül. Meg kell tenni a szükséges intézkedéseket a veszélyes áru normális szállítási feltételek melletti kiszabadulásának megakadályozására. Ez a fajta mentesség nem alkalmazható a 7 osztályra. Ugyancsak nem alkalmazható ez a mentesség a vállalatok (vállalkozások) által anyagbeszerzés, külső vagy belső anyagelosztás céljából végzett szállításokra;
- d) a kárelhárító szolgálatok által vagy felügyeletük mellett végzett szállításokra, amennyiben a szállítás a kárelhárítás érdekében szükséges, különösen a rendkívüli eseményben vagy balesetben érintett veszélyes áru összegyűjtésére és biztonságos helyre történő elszállítására;
- e) emberi életek mentését vagy a környezet védelmét szolgáló, veszélyhelyzetben történő szállításokra, amennyiben teljesen biztonságos végrehajtásukhoz minden intézkedést megtették;
- f) üres, tisztítatlan, telepített tárolótartályok, amelyekben a 2 osztály A, O vagy F csoportjába tartozó gázok, a 3 vagy 9 osztály II vagy III csomagolási csoportjába tartozó anyagok, vagy a 6.1 osztály II vagy III csomagolási csoportjába tartozó peszticidek voltak, azzal a feltétellel, hogy:
  - minden rajtuk lévő nyílás – az esetleges nyomáscsökkentő szerkezetek nyílásainak kivételével – légmentesen le van zárva;
  - megtették a szükséges intézkedéseket annak érdekében, hogy szokásos szállítási körülmények között a tartalom ne szivároгjon ki; és
  - a rakomány úgy van rögzítve rekeszben, kalodában vagy egyéb kezelőeszközben, ill. magán a kocsiban vagy a konténerben, hogy szokásos szállítási körülmények között ne lazuljon ki, ill. ne mozduljon el.

Ez a mentesség nem vonatkozik az olyan telepített tárolótartályokra, amelyekben érzékenyített robbanóanyag vagy a RID által a fuvarozásból kizárt anyag volt.

**Megjegyzés:** A radioaktív anyagokra lásd még az 1.7.1.4 bekezdést is.

### 1.1.3.2

#### *A gázok fuvarozására vonatkozó mentességek*

A RID előírásait nem kell alkalmazni, ha a fuvarozott anyagok (tárgyak) a következők:

- a) a szállítóeszközök tartályaiban levő gázok, amelyek azok meghajtására vagy különleges berendezéseinek (pl. hűtőkészülék) működtetésére szolgálnak;
- b) a szállított járművek tüzelőanyagtartályában levő gázok. A zárószelepnek a tartály és a motor között zárva kell lenni és az elektromos érintkezőket meg kell szakítani;
- c) a 2.2.2.1 bekezdés szerinti A és O csoport gázai, ha a gáz nyomása a tartályban vagy tartányban 20 °C-on nem haladja meg a 200 kPa-t (2 bar-t) és a gáz nem cseppfolyósított, ill. nem mélyhűtött cseppfolyósított gáz. Ide tartozik mindenfajta tartály és tartány, pl. a gépek és berendezések részeit képezők is;

- d) a jármű üzemelése során használt felszerelésekben (pl. tűzoltókészülékben) lévő gázok, beleértve a tartalék alkatrészekben (pl. felfújtt gumiabroncsban) lévő gázokat is. Ez a mentesség arra az esetre is vonatkozik, ha felfújtt gumiabroncsokat rakományként szállítanak;
- e) a kocsik különleges készülékeiben (hűtőkészülék, halszállító tartályok, fűtőkészülék stb.) levő gázok, amelyek a szállítás során ezek működtetéséhez szükségesek, valamint az ilyen készülékek tartalék tartályai és üres, tisztítatlan cseretartályai, amelyeket ugyanazon kocsiban szállítanak;
- f) az italokban és élelmiszerekben levő gázok.

#### **1.1.3.3 Folyékony tüzelőanyagok szállítására vonatkozó mentességek**

A RID előírásait nem kell alkalmazni a szállítóeszközök tüzelőanyag-tartályaiban levő üzemanyag szállítására, amely a szállítóeszköz meghajtására vagy speciális felszerelése (pl. hűtőgépek) működtetésére szolgál. A motorkerékpárok és segédmotoros kerékpárok motorja és tartálya között található csapot, ha a tartályokban üzemanyag van, szállítás közben zárva kell tartani; továbbá ezeket a motorkerékpárokat és segédmotoros kerékpárokat állítva kell berakni, és feldőlés ellen biztosítani kell.

#### **1.1.3.4 A különleges előírások szerinti és a korlátozott, ill. engedményes mennyiségben csomagolt veszélyes áruk fuvarozására vonatkozó mentességek**

**Megjegyzés:** A radioaktív anyagokra lásd az 1.7.1.4 bekezdést.

**1.1.3.4.1** A 3.3 fejezet bizonyos különleges előírásai egyes veszélyes anyagok fuvarozását részben vagy teljesen felmentik a RID előírásai alól. Ez a mentesség akkor alkalmazható, ha a különleges előírásra hivatkozás található a 3.2 fejezet „A” táblázat 6 oszlopában a szóban forgó veszélyes árura vonatkozóan.

**1.1.3.4.2** Bizonyos veszélyes áruk ugyancsak mentességet élvezhetnek, amennyiben a 3.4 fejezet feltételeit kielégítik.

**1.1.3.4.3** Bizonyos veszélyes áruk ugyancsak mentességet élvezhetnek, amennyiben a 3.5 fejezet feltételeit kielégítik.

#### **1.1.3.5 Az üres, tisztítatlan csomagolóeszközökre vonatkozó mentességek**

Az üres, tisztítatlan csomagolóeszközök (beleértve az üres IBC-eket és nagycsomagolásokat), amelyekben a 2, a 3, a 4.1, az 5.1, a 6.1, a 8 és a 9 osztály anyagai voltak, nem esnek a RID előírásainak hatálya alá, ha a lehetséges veszély elhárítására megfelelő intézkedéseket tettek. A veszély akkor tekinthető elhárítotttnak, ha megtették a megfelelő intézkedéseket az 1 – 9 osztály bármelyikére jellemző veszély elhárítására.

#### **1.1.3.6 Legnagyobb megengedett összmennyiség kocsinként, ill. nagykonténerenként**

**1.1.3.6.1** (fenntartva)

**1.1.3.6.2** (fenntartva)

**1.1.3.6.3** Ha egy kocsiban vagy nagykonténerben az 1.1.3.1.c) pont alapján ugyanazon szállítási kategóriába tartozó veszélyes árut szállítanak, a kocsira, ill. a nagykonténerre következő táblázat 3 oszlopában megadott legnagyobb megengedett mennyiségeket kell betartani:

Szállítási kategória	Anyag vagy tárgy csomagolási csoport vagy osztályozási kód/csoport vagy UN szám	Legnagyobb összmenyiség kocsinként, ill. nagykonténe- renként
(1)	(2)	(3)
0	<p>1 osztály: 1.1L, 1.2L, 1.3L és UN 0190</p> <p>3 osztály: UN 3343</p> <p>4.2 osztály: az I csomagolási csoportba tartozó anyagok</p> <p>4.3 osztály: UN 1183, 1242, 1295, 1340, 1390, 1403, 1928, 2813, 2965, 2968, 2988, 3129, 3130, 3131, 3134, 3148, 3396, 3398, 3399</p> <p>5.1 osztály: UN 2426</p> <p>6.1 osztály: UN 1051, 1600, 1613, 1614, 2312, 3250, 3294</p> <p>6.2 osztály: UN 2814, 2900</p> <p>7 osztály: UN 2912 – 2919, 2977, 2978, 3321 – 3333</p> <p>8 osztály UN 2215 (maleinsavanhidrid, olvasztott)</p> <p>9 osztály: UN 2315, 3151, 3152, 3432 és az ilyen anyagokat vagy keverékeket tartalmazó készülékek</p> <p>és az UN 2908 alá tartozók kivételével azok az üres, tisztítatlan csomagolóeszközök, amelyek az ebbe a szállítási kategóriába tartozó anyagokat tartalmazták.</p>	0
1	<p>Az I csomagolási csoportba tartozó anyagok és tárgyak, amelyek nem szerepelnek a 0 szállítási kategóriában és a következő osztályok anyagai és tárgyai:</p> <p>1 osztály: 1.1B – 1.1J<sup>a)</sup>, 1.2B – 1.2J, 1.3C, 1.3G, 1.3H, 1.3J, 1.5D<sup>a)</sup></p> <p>2 osztály: T, TC<sup>a)</sup>, TO, TF, TOC<sup>a)</sup> és TFC csoportok aeroszolok: C, CO, FC, T, TF, TC, TO, TFC és TOC csoport</p> <p>4.1 osztály: UN 3221 – 3224</p> <p>5.2 osztály: UN 3101 – 3104</p>	20
2	<p>A II csomagolási csoportba tartozó anyagok és tárgyak, amelyek nem szerepelnek a 0, az 1 vagy a 4 szállítási kategóriában és a következő osztályok anyagai és tárgyai:</p> <p>1 osztály: 1.4B – 1.4G és 1.6N</p> <p>2 osztály: F csoportok aeroszolok: F csoport</p> <p>4.1 osztály: UN 3225 – 3230</p> <p>5.2 osztály: UN 3105 – 3110</p> <p>6.1 osztály: III csomagolási csoportba tartozó anyagok és tárgyak</p>	333

Szállítási kategória	Anyag vagy tárgy csomagolási csoport vagy osztályozási kód/csoport vagy UN szám	Legnagyobb összmenyiség kocsinként, ill. nagykonténe- renként
(1)	(2)	(3)
	9 osztály: UN 3245	
3	A III csomagolási csoportba tartozó anyagok és tárgyak, amelyek nem szerepelnek a 0, a 2 vagy a 4 szállítási kategóriában és a következő osztályok anyagai és tárgyai: 2 osztály: A és O csoportok aeroszolok: A és O csoport 3 osztály: UN 3473 4.3 UN 3476 8 osztály: UN 2794, 2795, 2800, 3028 és 3477 9 osztály: UN 2990, 3072	1000
4	1 osztály: 1.4S 4.1 osztály: UN 1331, 1345, 1944, 1945, 2254, 2623 4.2 osztály: UN 1361 és 1362 III csomagolási csoport 7 osztály: UN 2908 – 2911 9 osztály: UN 3268 valamint azok az üres, tisztítatlan csomagolóeszközök, amelyek a 0 szállítási kategóriába tartozókon kívüli, többi anyagot tartalmazták.	Korlátlan

a) Az UN 0081, 0082, 0084, 0241, 0331, 0332, 0482, 1005 és 1017 számú anyagnál a legnagyobb összmenyiség kocsinként, ill. nagykonténerenként 50 kg.

Az előző táblázatban a „legnagyobb összmenyiség kocsinként, ill. nagykonténerenként” jelentése a következő:

- tárgyaknál a bruttó tömeg kg-ban (az 1 osztályba tartozó tárgyaknál a robbanóanyag nettó tömege kg-ban; a RID-ben szereplő gépekben és készülékekben lévő veszélyes áru esetén, a bennük lévő veszélyes áru összmenyisége kg-ban vagy literben);
- szilárd anyagoknál, cseppfolyósított gázoknál, mélyhűtött, cseppfolyósított gázoknál és oldott gázoknál a nettó tömeg kg-ban;
- folyékony anyagoknál és sűrített gázoknál a tartály névleges űrtartalma literben (lásd a meghatározást az 1.2.1 szakaszban).

#### 1.1.3.6.4

Ha a táblázat szerint különböző szállítási kategóriába tartozó veszélyes árukat ugyanabban a vasúti kocsiban vagy nagykonténerben fuvaroznak, akkor:

- az „1” szállítási kategóriába tartozó anyagok és tárgyak mennyisége 50-nel szorozva,
- az „1” szállítási kategóriába tartozó, az 1.1.3.6.3 pont táblázatához fűzött a) lábjegyzet szerinti anyagok és tárgyak mennyisége 20-szal szorozva,
- a „2” szállítási kategóriába tartozó anyagok és tárgyak mennyisége 3-mal szorozva, és
- a „3” szállítási kategóriába tartozó anyagok és tárgyak mennyisége

együttesen nem haladhatja meg az 1000-t.

- 1.1.3.6.5** E bekezdés alkalmazásánál nem kell figyelembe venni azokat a veszélyes árukat, amelyek az 1.1.3.2 – 1.1.3.5 bekezdés szerint mentességet élveznek.

**1.1.3.7** *Lítium akkumulátorok szállítására vonatkozó menteségek*

A RID előírásait nem kell alkalmazni:

- a) a szállítóeszközben alkalmazott lítium akkumulátorokra, amelyek annak meghajtására vagy bármely berendezésének működtetésére szolgálnak;
- b) a szállítás során használt (vagy használni szándékozott) eszközökben (pl. laptopban) lévő lítium akkumulátorokra, amelyek ezen eszközök működtetésére szolgálnak.

**1.1.4** *Más előírások alkalmazhatósága*

**1.1.4.1** *Általános előírások*

- 1.1.4.1.1** A tagállamok területén való nemzetközi fuvarozás a C Függelék 3. cikke szerinti szabályozás vagy tilalom alá eshet a fuvarozás biztonságán kívül egyéb okokból is. Az ilyen szabályozást, ill. tilalmat megfelelő módon közzé kell tenni.

**1.1.4.1.2** (fenntartva)

**1.1.4.1.3** (fenntartva)

**1.1.4.2** *Tengeri vagy légi szállítást is magában foglaló szállítási lánc*

- 1.1.4.2.1** Az olyan küldeménydarabokat, konténereket, mobil tartányokat és tankkonténereket, valamint kocsikat, amelyekben kocsirakományként csak ugyanazon árut tartalmazó küldeménydarabok vannak, amelyek nem felelnek meg teljesen a RID csomagolásra, egybecsomagolásra, a küldeménydarab jelölésére és bárcázására, és a nagybárcák és narancssárga táblák alkalmazására vonatkozó előírásainak, de megfelelnek az IMDG Kódex vagy az ICAO Műszaki Utasítások előírásainak, a tengeri vagy légi szállítást is magában foglaló szállítási láncban történő továbbításra a következő feltételekkel fel lehet venni:

- a) Ha a küldeménydarabok nincsenek a RID-nek megfelelően bárcázva és jelölve, akkor az IMDG Kódex vagy az ICAO Műszaki Utasítások szerinti veszélyességi bárcá(k)nak és jelölésnek kell rajtuk lenni.
- b) Az egy küldeménydarabba történő egybecsomagolásra az IMDG Kódex vagy az ICAO Műszaki Utasítások előírásait kell alkalmazni.
- c) A tengeri szállítást is magában foglaló szállítási láncban történő továbbításnál, ha a konténerek, mobil tartányok vagy tankkonténerek, valamint az olyan kocsik, amelyekben kocsirakományként csak ugyanazon árut tartalmazó küldeménydarabok vannak, nincsenek a RID 5.3 fejezete szerint jelölve és nagybárcával ellátva, akkor az IMDG Kódex 5.3 fejezete szerinti jelölésnek és nagybárcá(k)nak kell rajtuk lenni. Üres, tisztítatlan mobil tartányokat és tankkonténereket ezen előírás szerint egészen a tisztítóállomásig lehet szállítani (szállítási láncban történő továbbítást követően).

Ez a könnyítés nem vonatkozik azokra az árukra, amelyek a RID 1 – 9 osztályába tartozó veszélyes áruk, azonban az IMDG Kódex vagy az ICAO Műszaki Utasítások előírásai szerint nem veszélyesek.

**Megjegyzés:** Az 1.1.4.2.1 pont szerinti fuvarozásra lásd az 5.4.1.1.7 pontot is. Konténerben történő fuvarozásra lásd az 5.4.2 szakaszt is.

**1.1.4.2.2–****1.1.4.2.3** (fenntartva)**1.1.4.3** *A tengeri szállításra engedélyezett IMO-típusú mobil tartányok használata*

Azok az IMO-típusú mobil tartányok (1, 2, 5 és 7 típusú IMO tartányok), amelyek nem felelnek meg teljesen a 6.7 vagy a 6.8 fejezet követelményeinek, de amelyeket az IMDG Kódex (29-98 módosítás) előírásai szerint (beleértve az átmeneti előírásokat is) 2003. január 1-je előtt gyártottak és engedélyeztek, 2009. december 31-ig továbbra is használhatók, amennyiben kielégítik az IMDG Kódex (29-98 módosítás) vonatkozó vizsgálati előírásait, és az IMDG Kódex (33-06 módosítás) 3.2 fejezet 12 és 14 oszlopában hivatkozott előírásokat teljes mértékben kielégítik. 2009. december 31-e után azonban csak akkor használhatók, ha kielégítik az IMDG Kódex vonatkozó vizsgálati előírásait és a RID 3.2 fejezet 10 és 11 oszlopában található utasításokat, és megfelelnek a RID 4.2 fejezet előírásainak is.<sup>1)</sup>

**1.1.4.4** *Huckepack forgalom*

A veszélyes árukat huckepack fuvarozási módon is lehet továbbítani, mégpedig a következő előírások szerint:

A huckepack fuvarozási módon feladott közúti járműnek, valamint rakományának meg kell felelnie az ADR előírásainak.

Nem engedélyezettek azonban a következő anyagok:

- az 1 osztály A összeférhetőségi csoport robbanóanyagai (UN 0074, 0113, 0114, 0129, 0130, 0135, 0224 és 0473);
- a 4.1 osztály hőmérséklet-szabályozást igénylő, önreaktív anyagai (UN 3231 – 3240);
- az 5.2 osztály hőmérséklet-szabályozást igénylő, szerves peroxidjai (UN 3111 – 3120);
- a 8 osztályba tartozó kén-trioxid, legalább 99,95%-os tisztaságú, amit stabilizálás nélkül, tartányokban fuvaroznak (UN 1829).

**Megjegyzés:** A huckepack forgalomban használt hordozó kocsira elhelyezendő nagybárcákra és narancssárga jelölésre lásd az 5.3.1.3.2 és az 5.3.2.1.6 pontot. A fuvarokmányba teendő bejegyzésekre lásd az 5.4.1.1.9 pontot.

**1.1.4.5** *Nem vasúton történő továbbítás*

**1.1.4.5.1** Ha a RID előírásainak hatálya alá tartozó szállítást végző vasúti kocsit az útvonal egy részén nem vasúton továbbítják, akkor ezen az útvonalszámon csak azok a belföldi vagy nemzetközi szabályok alkalmazhatók, amelyek a veszélyes áruknak az útvonal szombat forgó részén a vasúti kocsi továbbítására használt szállítási móddal való szállítását adott esetben szabályozzák.

**1.1.4.5.2** Az érintett COTIF Tagállamok megállapodhatnak a RID alkalmazásában a fuvarozás azon szakaszára, amely során a vasúti kocsit nem vasúton továbbítják, szükség esetén kiegészítve további követelményekkel, kivéve, ha az érintett COTIF Tagállamok közötti ezen megállapodások ellentétesek a veszélyes áruknak az útvonal nevezett szakaszán a vasúti

---

1) A Nemzetközi Tengerészeti Szervezet (IMO) a DSC.1/Circ.12 számú körlevéllel (ill. helyesbítéseivel) kiadta „A meglévő IMO-típusú mobil tartányok és közúti tartányjárművek veszélyes áruk szállítására történő további használatára vonatkozó útmutatót” („Guidance on the Continued Use of Existing IMO Type Portable Tanks and Road Tank Vehicles for the Transport of Dangerous Goods”), amelynek szövege megtalálható az IMO honlapján: [www.imo.org](http://www.imo.org)

kocsi továbbítására alkalmazott szállítási módra vonatkozó nemzetközi megállapodások előírásaival. Ezeket a megállapodásokat a kezdeményező Tagállamnak be kell terjesztenie az OTIF Titkárságnak, amely a Tagállamokat értesíti<sup>2)</sup>.

---

2) Az ezen pont alapján kötött megállapodások az OTIF honlapján ([www.otif.org](http://www.otif.org)) megtekinthetők.

## 1.2 fejezet

### Meghatározások és mértékegységek

#### 1.2.1

#### Meghatározások

**Megjegyzés:** Ez a szakasz minden általános és különleges meghatározást tartalmaz.

A RID alkalmazásában:

**A**

**ADN:** a Veszélyes Áruk Nemzetközi Belvízi Szállításáról szóló Európai Megállapodás;

**ADR:** A Veszélyes Áruk Nemzetközi Közúti Szállításáról szóló Európai Megállapodás, beleértve a külön megállapodásokat is, amelyeket a szállításban résztvevő Szerződő Felek aláírtak;

**Aeroszol** vagy **aeroszol csomagolás:** a 6.2.6 szakasz követelményeit kielégítő, fémből, üvegből vagy műanyagból készült, nem utántölthető tartály, amely sűrített, cseppfolyósított vagy nyomás alatt oldott gázt tartalmaz valamilyen folyékony, pépszerű vagy por alakú anyaggal együtt vagy akár nélküle, olyan adagoló szerkezettel, amely lehetővé teszi a tartalomnak gázban szuszpendált szilárd vagy folyékony részecskék, hab, paszta, por formájában, folyadék vagy gáz alakban való kibocsátását;

**Állandósult nyomás:** a nyomástartó tartály tartalmának nyomása a termikus és diffúziós egyensúly elérése után;

**Állati eredetű anyagok:** az állati tetemek, állati testrészek és az állati eredetű takarmány;

**ASTM:** American Society for Testing and Materials (Amerikai Anyagvizsgálati Társaság), (ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA, 19428-2959, United States of America);

**Átalakított csomagolóeszköz:** különösen

- a) az olyan fémhordók,
  - i) amelyeket nem UN típusból alakítottak át a 6.1 fejezet előírásainak megfelelő, UN típusúvá; vagy
  - ii) amelyeket a 6.1 fejezetnek megfelelő valamely UN típusból egy másik UN típusúvá alakítottak át; vagy
  - iii) amelyek valamely lényeges szerkezeti elemét (pl. a nem levehető tetőt) kicserélték;
- b) az olyan műanyag hordók,
  - i) amelyeket egyik UN típusból egy másik UN típusúvá alakítottak át (pl. 1H1-ből 1H2-vé); vagy
  - ii) amelyek valamely lényeges szerkezeti elemét kicserélték.

Az átalakított csomagolóeszközök a 6.1 fejezet ugyanazon követelményei alá esnek, mint amelyeket az azonos típusú, új csomagolóeszközökre kell alkalmazni;

**Átalakított IBC:** lásd **nagyméretű csomagolóeszköz (IBC)**;

**B**

**Battériás kocsi:** olyan kocsi, amelynek egymással gyűjtőcsővel összekötött és tartósan a kocsira rögzített elemei vannak. A következő elemek tekinthetők a battériás kocsi elemeinek: palackok, nagypalackok, gázhordók, palackkötegek és a 2 osztály gázainak szállítására készült, 450 liternél nagyobb befogadóképességű tartányok;

**Bélés:** olyan különálló tömlő vagy zsák, beleértve nyílásainak zárószerkezeteit, amelyet a csomagolóeszközbe (nagycsomagolásba, IBC-be) helyeztek el, de nem alkotja annak szerves részét;

**Belső csomagolóeszköz:** olyan csomagolóeszköz, amelyet a szállításhoz külső csomagolással kell ellátni;

**Belső tartály:** olyan tartály, amelyet külső csomagolással kell ellátni ahhoz, hogy befogadó funkcióját betöltse;

**Berakó:** az a vállalkozás, amelyik a veszélyes árut a vasúti kocsiba vagy nagykonténerbe berakja;

**Biztonsági szelep:** nyomáskülönbség hatására automatikusan működésbe lépő, rugóterhelésű szerkezet, amelynek feladata a nem megengedett belső nyomás kialakulásának megakadályozása a tartányban;

**Biztonsági tartály (a 7 osztály anyagainak szállításánál):** a csomagolási elemeknek a tervező által meghatározott együttese, amelynek feladata a radioaktív anyagok kiszabadulásának megakadályozása a szállítás során;

**C**

**CGA:** Compressed Gas Association (Sűrített Gáz Egyesület), (CGA, 4221 Walney Road, 5th Floor, Chantilly VA 20151-2923, United States of America);

**Címzett (átvevő):** a fuvarozási szerződés szerinti címzett. Ha a címzett a fuvarozási szerződésre vonatkozó előírásokkal összhangban harmadik személyt jelöl meg, a RID értelmében ezt a személyt kell címettnak tekinteni. Ha a fuvarozást szerződés nélkül végzik, az a vállalkozás tekintendő címettnak, amely megérkezéskor a veszélyes árut átveszi;

**Criticality safety index (CSI):** lásd *kritikussági biztonsági mutatószám (CSI)*

**CSC Egyezmény:** „A Biztonságos Konténerekről szóló 1972. évi Nemzetközi Egyezmény” módosított kiadása, kiadja a Nemzetközi Tengerészeti Szervezet (IMO), London (Magyarországon kihirdette a 2003. évi LXIV. törvény);

**Cs**

**Cserefelépítmény:** lásd *konténer*;

**Csomagolási csoport:** olyan csoport, melyhez csomagolás céljából egyes anyagok veszélyességük mértéke szerint rendelhetők hozzá. A csomagolási csoportok a következőket jelentik (bővebb magyarázat a 2. részben található):

I csomagolási csoport: nagyon veszélyes anyagok;

II csomagolási csoport: közepesen veszélyes anyagok;

III csomagolási csoport: kevésbé veszélyes anyagok;

**Megjegyzés:** Bizonyos, veszélyes anyagokat tartalmazó tárgyak is valamely csomagolási csoporthoz vannak hozzárendelve.

**Csomagoló:** az a vállalkozás, amely a veszélyes árut csomagolóeszközbe, nagycsomagolásba vagy IBC-be teszi, ill. szükség esetén előkészíti a küldeménydarabokat a szállításhoz;

**Csomagolóeszköz (csomagolás):** egy vagy több tartály és minden egyéb szerkezeti elem vagy anyag, amely szükséges ahhoz, hogy a tartály betölthesse befogadó és egyéb biztonsági funkcióját (lásd még *átalakított csomagolóeszköz, belső csomagolóeszköz, felújított csomagolóeszköz, finomlemez csomagolóeszköz, IBC, ismételten felhasznált csomagolóeszköz, kármentő csomagolás, kombinált csomagolás, köztes csomagolóeszköz, külső csomagolóeszköz, nagycsomagolás, összetett (műanyag) csomagolóeszköz, összetett (üveg, porcelán, kőagyag) csomagolóeszköz és portömör csomagolóeszköz*);

## E

**Egyesítőcsomagolás:** olyan – a 7 osztály esetében egyetlen feladó által használt – burkolat, amit egy vagy több küldeménydarab egységbe fogására használnak a szállítás alatti könnyebb kezelés és rakodás céljából.

Egyesítőcsomagolás például:

- a) a rakományképző eszköz, pl. rakodólap, amelyre több küldeménydarabot raknak vagy halmazolnak és műanyag pántszalaggal, zsugor- vagy nyújtható fóliával vagy más alkalmas módon rögzítenek; vagy
- b) a külső védőcsomagolás, mint pl. láda vagy rekesz;

**EN (szabvány)\*:** Az Európai Szabványügyi Bizottság (CEN) által kiadott európai szabvány (CEN – 36 rue de Stassart B-1050 Brussels);

## Engedély:

**Egyoldalú engedély (a 7 osztály anyagainak szállításánál):** a mintadarab olyan engedélye, amelyet csak a mintadarab származási országa illetékes hatóságnak kell megadnia. Amennyiben a származási ország nem valamely COTIF Tagállam, akkor a küldemény által érintett első COTIF Tagállam illetékes hatóságának kell ezt az engedélyt elismernie (lásd a 6.4.22.6 bekezdést).

**Többoldalú engedély (a 7 osztály anyagainak szállításánál):** az olyan engedély, amelyet a mintadarabnak, ill. a szállításnak a származási, ill. kiindulási országa illetékes hatósága ad, és mindazon országok illetékes hatósága, amely országba vagy amely országon keresztül a küldeményt szállítják. E vonatkozásban az „amely országba vagy amely országon keresztül” kifejezés egyértelműen nem terjed ki arra az esetre, amikor az ország fölött szállítják, vagyis az engedélyre és értesítésre vonatkozó követelmények nem vonatkoznak arra az országra, amely fölött a radioaktív anyagot légi járművel szállítják, feltéve, hogy nincs tervezett leszállás abban az országban.

**ENSZ Minta Szabályzat:** az ENSZ „Ajánlások a veszélyes áruk szállítására – Minta szabályzat” kiadvány tizenötödik javított kiadása (ST/SG/AC.10/1/Rev.15);

## F

**Fa IBC:** merev vagy összecukható fa testből és bélésből (de nem belső csomagolásból), továbbá szerkezeti és üzemi szerelvényekből álló IBC;

**Fahordó:** fából kör keresztmetszettel, domború paláستtal készült csomagolóeszköz, dongákból és fenekekből összeállítva és abrónsokkal ellátva;

\* A magyar szöveg a szabványok címét a Magyar Szabványügyi Testület szabványkatalógusában szereplő fordításban közli. A szabványok szóhasználata esetenként jelentősen eltérhet a RID szóhasználatától.

**Fedett kocsi:** vasúti kocsi fix vagy eltolható oldalfalakkal és tetővel;

**Feladó:** az a vállalkozás, amely a veszélyes árut a saját nevében vagy harmadik fél megbízásából feladja. Ha a szállítást fuvarozási szerződés alapján végzik, a feladó a fuvarozási szerződés szerinti feladót jelenti;

**Felújított csomagolóeszköz:** különösen

- a) az olyan fémhordók, amelyeket
  - i) az eredeti szerkezeti anyagig megtisztítottak, eltávolítva minden korábbi tartalmat, a belső és külső korróziós nyomokat és a külső bevonatokat és bárcákat;
  - ii) visszaállítottak eredeti alakjukra és körvonalukra, peremeiket (ha vannak) kiegyengették és tömítették és minden, nem beépített tömítésüket kicserélték;
  - iii) tisztítás után, de festés előtt megvizsgáltak, és kiselejtezték azokat, amelyeken látható kitörések, az anyagvastagság jelentős csökkenése, fémkifáradás, sérült menetek vagy záróelemek, vagy egyéb jelentős hiányosságok tapasztalhatók;
- b) az olyan műanyag hordók és kannák,
  - i) amelyeket az eredeti szerkezeti anyagig megtisztítottak, eltávolítva minden korábbi tartalmat, külső bevonatot és bárcát;
  - ii) amelyek minden, nem beépített tömítését kicserélték; és
  - iii) amelyeket tisztítás után megvizsgáltak, és kiselejtezték azokat, amelyeken látható kopások, törések, repedések, sérült menetek vagy záróelemek, vagy egyéb jelentős hiányosságok tapasztalhatók;

**Fém IBC:** fém-testből, valamint a megfelelő üzemi és szerkezeti szerelvényekből álló IBC;

**Finomlemez csomagolóeszköz:** olyan kör, ellipszis, négyszög vagy sokszög keresztmetszetű (vagy kúp alakú), valamint kúpos nyakú vagy vödör alakú, ónozott acéllemezből vagy finomlemezből 0,5 mm-nél kisebb falvastagsággal, lapos vagy domború fenékkal, egy vagy több töltőnyílással készült csomagolóeszköz, amely nem esik a hordóra vagy kannára vonatkozó meghatározás alá;

**Folyékony anyag:** olyan anyag, amelynek gőznyomása 50 °C-on legfeljebb 300 kPa (3 bar) és 101,3 kPa nyomáson 20 °C-on nem teljesen gáz alakú, és

- a) olvadáspontja vagy olvadás kezdőpontja 101,3 kPa nyomáson legfeljebb 20 °C; vagy
- b) az ASTM D 4359-90 vizsgálati módszerrel meghatározva folyékony; vagy
- c) a 2.3.4 szakaszban leírt folyékonyság meghatározási vizsgálat (penetrométer eljárás) kritériumai szerint nem pasztaszerű;

**Megjegyzés:** A „folyékony állapotban történő szállítás” a tartányokra vonatkozó előírások tekintetében:

- az előző meghatározás szerint folyékony anyag szállítása, vagy
- olyan szilárd anyag szállítása, amelyet olvasztott állapotban adnak át a szállításra.

**Fuvarozó:** az a vállalkozás, amely az árutovábbítást végzi, akár fuvarozási szerződés alapján, akár anélkül;

**Fuvarokmány:** a fuvarozási szerződésnek megfelelő fuvarlevél [lásd a Nemzetközi Vasúti Árufuvarozási Szerződésekre vonatkozó Egységes Szabályok (CIM – a COTIF B

Függeléke)], az „Általános Szerződés a Teherkocsik Használatára” (AVV<sup>3)</sup>) szerinti „üres kocsis kísérlével”, vagy az 5.4.1 szakasz előírásainak megfelelő, más fuvarokmány;

**Fuvarozás (szállítás):** a veszélyes áru helyváltoztatása, beleértve a közlekedési okokból történő megállásokat, illetve minden olyan közlekedési szempontból szükségessé vált időszakot a helyváltoztatás előtt, alatt és után, amely alatt a veszélyes áru a vasúti kocsiban, tartányban vagy konténerben van.

Ez a fogalom kiterjed a veszélyes áruk átmeneti tárolására is a szállítási módok, illetve a szállítóeszközök cseréjénél (átrakásnál), azzal a feltétellel, hogy az áru átvételének és kiszolgáltatásának helyét feltüntető fuvarokmányt kérésre bemutatják, illetve a küldeménydarabokat vagy a tartányokat a fuvarozás alatt nem nyitják fel, kivéve, ha az illetékes hatóságok ellenőrzik.

## G

**Gáz:** olyan anyag, amelynek

- a) gőznyomása 50 °C-on meghaladja a 300 kPa-t (3 bar-t); vagy
- b) 20 °C-on és 101,3 kPa normál nyomáson teljesen gáz alakú;

**Gázhordó:** szállításra használt, hegesztett, nyomástartó tartály legalább 150 liter, de legfeljebb 1000 liter űrtartalommal (pl. hengeres tartály gördítőabroncsokkal; csúszótálpakra erősített, gömb alakú tartály);

**Gázpatron (gázzal töltött kis méretű tartály):** olyan nem utántölthető tartály, amely túlnyomás alatti gázt vagy gázkeveréket tartalmaz, és szeleppel is ellátható;

**Gázzal töltött kis méretű tartály:** lásd **gázpatron**;

**GHS:** a „Vegyi anyagok osztályozásának és címkézésének egyetemes harmonizált rendszere” második módosítása, amelyet az ENSZ ST/SG/AC.10/30/Rev.2 jelű kiadványa tartalmaz;

## Gy

**Gyúlékony alkotórész (aeroszolonál):** a „Vizsgálatok és kritériumok kézikönyv”, III. rész 31.1.3 szakaszához fűzött 1 – 3. megjegyzésben meghatározott gyúlékony folyékony anyag, gyúlékony szilárd anyag, ill. gyúlékony gáz és gázkeverék. Ez a meghatározás nem terjed ki a piroforos, az önmelegedő és a vízzel reaktív anyagokra. A kémiai égéshőt a következő módszerek valamelyikével kell meghatározni: ASTM D 240, ISO/FDIS 13943: 1999 (E/F) 86.1 – 86.3, ill. NFPA 30B;

**Gyűjtőmegnevezés:** az anyagok vagy tárgyak jól körülhatárolt csoportját jelentő tétel (lásd a 2.1.1.2 bekezdés B., C. és D. pontját);

## H

**Hajlékony falú IBC:** fóliából, szövetből vagy más hajlékony anyagból vagy ilyen anyagok kombinációjából készült csomagolóeszköz-testből álló IBC, szükség esetén belső bevonattal vagy béléssel, a megfelelő üzemi és kezelő szerelvényekkel felszerelve;

**Hajlékony falú IBC rendszeres karbantartása:** lásd **nagyméretű csomagolóeszköz (IBC)**;

**Hordó:** fémből, papírlémezről, műanyagból, rétegelt falemezből vagy más alkalmas

3) 2006. július 1-i kiadás, kiadja az AVV-Büro, Avenue des Arts, 53, BE-100 Bruxelles.

anyagból készült, henger alakú csomagolóeszköz, sík vagy domború fenékkal. Ez a meghatározás magában foglalja az egyéb alakú csomagolóeszközöket is, pl. kúpos nyakú, kör keresztmetszetű tartályokat vagy vödröket. A fahordók és a kannák nem tartoznak ezen meghatározás alá;

**Huckepack forgalom:** közúti járművek vasúti kocsin történő fuvarozása;

**Hulladék:** olyan anyag, oldat, keverék és tárgy, amelyet általában közvetlenül nem lehet felhasználni, de amelyet újrahasznosítási eljárás, lerakóhelyen való tárolás, égetéssel vagy más módon történő ártalmatlanítás céljából szállítanak;

**Hulladék szállítására szolgáló, vákuummal üzemelő tartány:** olyan tankkonténer vagy tartányos cserefelépítmény, amelyet elsődlegesen veszélyes hulladékok szállítására használnak, és a hulladékok töltését, ill. ürítését szolgáló speciális kialakítása, ill. felszerelése megfelel a 6.10 fejezet előírásainak. Az olyan tartány, amely mindenben megfelel a 6.7 vagy a 6.8 fejezet előírásainak, nem minősül „hulladék szállítására szolgáló, vákuummal üzemelő tartány”-nak;

## I

**IAEA:** Nemzetközi Atomenergia Ügynökség (NAÜ), (IAEA, P.O.Box 100, A-1400 Wien);

**IBC:** lásd *nagyméretű csomagolóeszköz*;

**ICAO:** International Civil Aviation Organization (Nemzetközi Polgári Repülési Szervezet), (ICAO, 999 University Street, Montreal, Quebec H3C 5H7, Canada);

**ICAO Műszaki Utasítások:** a Nemzetközi Polgári Repülésről szóló Chicagói Egyezmény 18. Függeléke, a Veszélyes Áruk Légi Szállításának Biztonságát Szolgáló Műszaki Utasítások, amelyet a Nemzetközi Polgári Repülési Szervezet (ICAO), (Montreal) ad ki. Magyarországon kihirdette az 1971. évi 25. tvr. és a 20/1997.(X.21) KHVM rendelet;

**Illetékes hatóság:** az a hatóság vagy hatóságok vagy egyéb szervezet vagy szervezetek, amelye(ke)t az egyes országokban, az egyes esetekre a belföldi jogszabályok szerint kijelölnek;

**IMDG Kódex:** az „Életbiztonság a tengeren” tárgyú nemzetközi egyezmény (SOLAS egyezmény), 1974, A rész, VII. fejezetének végrehajtására szolgáló Veszélyes Áruk Nemzetközi Tengerészeti Kódexe, amelyet a Nemzetközi Tengerészeti Szervezet (IMO), (London), ad ki. Magyarországon kihirdette a 2001. évi XI. törvény;

**IMO:** International Maritime Organization (Nemzetközi Tengerészeti Szervezet), (IMO, 4 Albert Embankment, London SE1 7SR, United Kingdom);

**Ismételten felhasznált csomagolóeszköz:** olyan csomagolóeszköz, amelyet megvizsgáltak és olyan sérülésektől mentesnek találtak, amelyek befolyásolnák a teljesítőképességi vizsgálatok elviselését; a fogalom kiterjed azokra a csomagolóeszközökre is, amelyeket azonos vagy hasonló összeférhetőségű termékkel töltenek meg ismételten és a termék feladója által ellenőrzött elosztási láncban szállítanak;

**ISO (szabvány):** a Nemzetközi Szabványügyi Szervezet (ISO) (1, rue de Varembe – CH-1204 Geneva 20) által kiadott nemzetközi szabvány;

## J

**Javított IBC:** lásd *nagyméretű csomagolóeszköz (IBC)*;

## K

**Kanna:** fémből vagy műanyagból készült, négy- vagy sokszög keresztmetszetű, egy- vagy többnyílású csomagolóeszköz;

**Kármentő csomagolás:** olyan különleges csomagolóeszköz, amelybe sérült, meghibásodott vagy szivárgó veszélyes áru küldeménydarabot vagy kiszóródott, kifolyt veszélyes árut lehet elhelyezni visszanyerés vagy ártalmatlanítás céljából történő szállításhoz;

**Kényszervezérlésű szellőzőszelep:** olyan szelep az alsó ürítésű tartányon, amely a fenékszeleppel össze van kapcsolva és üzemszerűen csak a tartány töltésénél és ürítésénél van nyitva a tartány szellőzéséhez;

**Kérelmező:** megfelelőség-értékelés vonatkozásában a gyártó vagy valamely COTIF Tagállamban felhatalmazott képviselője. Időszakos és soron kívüli vizsgálat vonatkozásában a **kérelmező** a vizsgálóhely, az üzemben tartó vagy valamely COTIF Tagállamban felhatalmazott képviselőjük;

**Megjegyzés:** *Megfelelőség-értékelési kérelmet kivételes esetben harmadik fél (pl. az 1.2.1 szakasz meghatározása szerinti üzemben tartó) is benyújthat.*

**Kezelő szerelvény (hajlékony falú IBC-knél):** az IBC testéhez erősített vagy az IBC test folytatásaként kialakított fül, hurok, szem vagy keret;

**Kiskonténer:** lásd **konténer**;

**Kizárólagos használat (a 7 osztály anyagainak szállításánál):** a jármű vagy a nagykonténer egyetlen feladó általi használata, amikor is a szállítás előtt, alatt és után az összes be- és kirakási műveletet a feladó vagy a címzett utasítása szerint végzik;

**Kocsi:** saját meghajtás nélküli vasúti jármű, amely saját kerekein a vasúti sínen gördül és áru szállításra szolgál;

**Kocsirakomány:** egy vasúti kocsi kizárólagos használata, függetlenül attól, hogy a kocsi rakománytere teljes egészében vagy csak részben van kihasználva;

**Megjegyzés:** *A 7 osztálynál a megfelelő kifejezés a „kizárólagos használat”.*

**Kombinált csomagolás:** szállítási csomagolóeszköz-kombináció, amely egy vagy több belső csomagolóeszközből áll, amelye(ke)t külső csomagolóeszközbe helyeztek el a 4.1.1.5 bekezdésnek megfelelően;

**Megjegyzés:** *A „kombinált csomagolás” „belső elemét” mindig „belső csomagolás”-nak nevezik és nem „belső tartály”-nak. Az üvegpalack jó példa az ilyen „belső csomagolás”-ra.*

**Konténer:** olyan szállítóeszköz (daruzható, emelhető vagy más hasonló szerkezet), amely

- tartós jellegű és ennek megfelelően elég szilárd ahhoz, hogy ismételten felhasználható legyen;
- kifejezetten úgy van kialakítva, hogy megkönnyítse az áruknak egy vagy több szállítóeszközzel – a rakomány megbontása nélkül – történő szállítását;
- a rakodást és a különböző szállítóeszközök közötti gyors átrakást lehetővé tevő elemekkel van ellátva;
- kialakításánál fogva az áru egyszerűen berakható és kirakható;
- a radioaktív anyagok szállítására használt konténerek kivételével befogadóképessége legalább 1 m<sup>3</sup>.

Ezen kívül:

A **kiskonténer** olyan konténer, amelynek vagy külső méretei (hosszúsága, szélessége, magassága) 1,5 m-nél kisebbek vagy befogadóképessége legfeljebb 3 m<sup>3</sup>;

**A nagykonténer**

- a) olyan konténer, amely nem felel meg a kiskonténer meghatározásának;
- b) „A Biztonságos Konténerekről szóló 1972. évi Nemzetközi Egyezmény (CSC)” értelmében:
- olyan méretű konténer, amelynek az alsó négy sarokkal behatárolt területe
- i) legalább 14 m<sup>2</sup> (150 négyzetláb); vagy
  - ii) legalább 7 m<sup>2</sup> (75 négyzetláb), ha felső sarokelemekkel rendelkezik;

**A nyitott konténer** nyitott tetejű konténer vagy szállítólap alapú konténer;

**A ponyvás konténer** a berakott áru védelme érdekében ponyvával ellátott nyitott konténer;

**A zárt konténer** teljesen zárt, szilárd tetejű, oldalfalú, végfalú és padlójú konténer. Ide tartozik az a nyitható tetejű konténer is, amelynek teteje a szállítás alatt zárva tartható;

**A cserefelépítmény** olyan konténer, amely az EN 283 Európai Szabvány (1991. évi kiadás) szerint a következő jellemzőkkel bír:

- szilárdság szempontjából csak szárazföldi vasúti és közúti, valamint komphajón történő fuvarozásra van méretezve;
- nem halmazolható;
- a közúti járművekről a jármű rakfelületén levő berendezéssel saját támasztólábaira lerakható, ill. visszarakható;

**Megjegyzés:** A „konténer” fogalom nem terjed ki a hagyományos csomagoló-eszközökre, IBC-kre, tankkonténerekre és kocsikra. Radioaktív anyagok szállításánál azonban a konténerek csomagolóeszközként használhatók.

**Köztes csomagolóeszköz:** olyan csomagolóeszköz, amelyet a belső csomagolások vagy tárgyak és a külső csomagolás közé helyeznek;

**Kritikus hőmérséklet:** az a hőmérséklet, amely felett az anyag nem létezhet folyékony halmazállapotban;

**Kritikussági biztonsági mutatószám (CSI) hasadóanyagot tartalmazó küldeménydarabhoz, egyesítőcsomagoláshoz vagy konténerhez (a 7 osztály anyagainak szállításánál):** olyan szám, amelyet a hasadó anyagot tartalmazó küldeménydarabok, egyesítőcsomagolások vagy konténerek együttesének ellenőrzésére használnak;

**Küldemény:** olyan veszélyes áru küldeménydarab(ok) vagy rakomány, amelyet a feladó szállításra átad;

**Küldeménydarab:** a csomagolási művelet végterméke, amely a feladásra kész csomagolóeszközből, nagycsomagolásból vagy IBC-ből és tartalmából áll. A fogalom kiterjed a gázok szállítására használt, ezen fejezet szerinti tartályokra, valamint az olyan tárgyakra is, amelyek méretük, tömegük vagy kialakításuk folytán csomagolás nélkül vagy rekeszben (csúszótalpon), kosárban vagy rakodóeszközben szállíthatók. A radioaktív anyagok szállítását kivéve, nem terjed ki terjed ki e fogalom azokra az árukra, amelyeket ömlesztve szállítanak, sem a tartányban szállított anyagokra;

**Megjegyzés:** A radioaktív anyagokra lásd a 2.2.7.2 bekezdést, a 4.1.9.1.1 pontot és a 6.4 fejezetet.

**Küldeménydarab tömege:** ellenkező meghatározás hiányában a küldeménydarab bruttó tömege;

**Külső csomagolóeszköz:** az összetett csomagolóeszköz vagy kombinált csomagolás külső védelme felszívóanyaggal, tömítőanyaggal és minden egyéb elemmel, ami szükséges a belső tartályok vagy belső csomagolóeszközök befogadásához és védelméhez;

## **L**

**Láda:** fémből, fából, rétegelt falemezből, farostlemezéből, papírlamezből, műanyagból vagy más alkalmas anyagból készült, négyszögletes vagy sokszög alakú oldalakkal rendelkező teljes falú csomagolóeszköz. Kis nyílások olyan célokra, mint a könnyebb megfogás vagy felnyitás vagy a besorolási követelmények kielégítése, engedélyezettek, amennyiben ezek nem befolyásolják a csomagolóeszköz integritását a fuvarozás alatt;

**Légmentesen zárt tartány:** folyékony anyagok szállítására szolgáló, legalább 4 bar nyomásra méretezett tartány, vagy szilárd (porszerű vagy szemcsés) anyagok szállítására szolgáló tartány – a tervezési nyomásától függetlenül –, amelynek nyílásai légmentesen zárva vannak, és:

- nincs rajta se biztonsági szelep, se hasadótárcsa vagy más hasonló biztonsági berendezés, se vákuumszelep vagy kényszervezérlésű szellőzőszelep; vagy
- nincs rajta se biztonsági szelep, se hasadótárcsa vagy más hasonló biztonsági berendezés, de van rajta a 6.8.2.2.3 pont előírásának megfelelő vákuumszelep vagy kényszervezérlésű szellőzőszelep; vagy
- van rajta biztonsági szelep, ami előtt a 6.8.2.2.10 pont szerint hasadótárcsa van, de nincs rajta vákuumszelep vagy kényszervezérlésű szellőzőszelep; vagy
- van rajta biztonsági szelep, ami előtt a 6.8.2.2.10 pont szerint hasadótárcsa van, és van rajta a 6.8.2.2.3 pont előírásának megfelelő vákuumszelep vagy kényszervezérlésű szellőzőszelep is;

**Legnagyobb nettó tömeg:** egyetlen csomagolás tartalmának legnagyobb tiszta tömege, vagy belső csomagolások és ezek tartalmának legnagyobb együttes tömege kg-ban;

**Legnagyobb normál üzemi nyomás (a 7 osztály anyagainak szállításánál):** a közepes tengerszint feletti levegőnyomást meghaladó azon legnagyobb nyomás, amely a biztonsági tartály belsejében a szállítás során fennálló környezeti feltételeknek megfelelő hőmérsékleti és napsugárzási viszonyok mellett, szellőztetés, segédrendszer általi külső hűtés vagy szállítás közbeni üzemi ellenőrzés nélkül egy év alatt kialakulhat;

**Legnagyobb űrtartalom:** a tartály vagy csomagolóeszköz (beleértve az IBC-t és a nagycsomagolást is) legnagyobb befogadóképessége m<sup>3</sup>-ben vagy literben;

**Legnagyobb üzemi nyomás (túlnyomás):** a következő három érték közül a legnagyobb:

- a) a tartányban a töltés során megengedett legnagyobb tényleges nyomás (legnagyobb megengedett töltési nyomás);
- b) a tartányban az ürítés során megengedett legnagyobb tényleges nyomás (legnagyobb megengedett ürítési nyomás); és
- c) az a tényleges túlnyomás, amelyet a tartányra annak tartalma (beleértve azokat az idegen gázokat is, amelyeket tartalmazhat) a legnagyobb üzemi hőmérsékleten fejt ki.

Hacsak a 4.3 fejezetben levő különleges előírások másként nem rendelkeznek, az üzemi nyomás (túlnyomás) számszerű értéke nem lehet kisebb, mint a tartalom gőznyomása (abszolút nyomása) 50 °C-on.

A biztonsági szelepekkel (hasadótárcsával vagy anélkül) felszerelt tartányok esetén azonban a legnagyobb üzemi nyomásnak (túlnyomásnak) a biztonsági szelepekre előírt

nyitónyomással kell egyenlőnek lennie. Ez a követelmény nem vonatkozik a 2 osztály sűrített, cseppfolyósított és oldott gázainak szállítására szolgáló tartányokra. (lásd még *próbanyomás, tervezési nyomás, töltési nyomás és ürítési nyomás*);

**Megjegyzés:** 1. A mobil tartányokra lásd a 6.7 fejezetet.

2. A zárt mélyhűtő tartályokra lásd a 6.2.1.3.6.5 ponthoz fűzött megjegyzést.

**Leszerelhető tartány:** a vasúti kocsi különleges építésmódjához illeszkedő tartány, arról csak a rögzítőberendezések oldása után vehető le;

**Lobbanáspont:** egy folyékony anyag azon legalacsonyabb hőmérséklete, amelynél gőzei a levegővel gyúlékony keveréket alkotnak;

## M

**Megengedett legnagyobb bruttó tömeg:**

- a) (a hajlékony falú IBC-ket kivéve, minden más IBC típusnál) az IBC, az üzemi és a szerkezeti szerelvények tömegének, valamint a legnagyobb nettó rakomány tömegnek az összege;
- b) (tartányoknál) a tartány saját tömege és a szállításra megengedett legnagyobb rakomány össztömege;

**Megjegyzés:** A mobil tartányokra lásd a 6.7 fejezetet.

**Megengedett legnagyobb rakomány (hajlékony falú IBC-knél):** az a legnagyobb nettó tömeg, amelyre az IBC-t kialakították és amelynek szállítására engedélyezték;

**Megfelelőség biztosítása (radioaktív anyagoknál):** az illetékes hatóság által alkalmazott rendszeres intézkedési program, amelynek célja annak biztosítása, hogy a RID követelményei a gyakorlatban megvalósuljanak;

**Megfelelőség-értékelés:** egy termék megfelelőségének ellenőrzése az 1.8.6 és az 1.8.7 szakasznak a típusjóváhagyásra, a gyártás felügyeletére és az üzembe helyezés előtti vizsgálatra vonatkozó előírásai szerint;

**MEG-konténer:** lásd *többeleemes gázkonténer*;

**Megtartó rendszer (a 7 osztály anyagainak szállításánál):** a hasadóanyagnak és a csomagolási elemeknek a tervező által meghatározott és az illetékes hatóság által jóváhagyott együttese, amelynek feladata a kritikussági biztonság fenntartása;

**Mélyhűtő tartály:** szállításra használt, hőszigetelt, nyomástartó tartály mélyhűtött, cseppfolyósított gázokhoz, legfeljebb 1000 liter űrtartalommal;

**Merev falú belső tartály (összetett IBC-knél):** olyan tartály, amely üres, tisztítatlan állapotban, a zárószerkezet helyre tétele és a külső burkolat segítségével is megtartja szokásos alakját. Minden belső tartályt, amely nem „merev falú”, „hajlékony falú”-nak kell tekinteni;

**Merev falú IBC rendszeres karbantartása:** lásd *nagyméretű csomagolóeszköz (IBC)*;

**Merev falú műanyag IBC:** merev műanyag testből álló IBC, amely vázszerkezettel rendelkezhet, és a megfelelő üzemi szerelvényekkel látható el;

**Minőségbiztosítás:** bármely szervezet vagy szerv által alkalmazott rendszeres ellenőrzési és felügyeleti program, amelynek célja annak biztosítása, hogy a RID biztonsági előírásai a gyakorlatban megvalósuljanak;

**Minta** (a 7 osztály anyagainak szállításánál): valamely különleges formájú radioaktív anyag, kis mértékben diszpergálódó radioaktív anyag, küldeménydarab vagy csomagolás leírása, ami lehetővé teszi az ilyen tárgy pontos azonosítását. A leíráshoz adatlapok, szerkezeti rajzok, az előírásokkal való egyezőséget tanúsító jelentések és más mértékadó dokumentumok tartozhatnak;

**m.n.n. (másként meg nem nevezett) tétel:** olyan gyűjtőmegnevezés, amelyhez olyan anyagok, keverékek, oldatok vagy tárgyak rendelhetők, amelyek

- a) nincsenek a 3.2 fejezet „A” táblázatában név szerint megemlítve; és
- b) az m.n.n. tétel megnevezésének, osztályának, osztályozási kódjának és csomagolási csoportjának megfelelő kémiai, fizikai és/vagy veszélyes tulajdonságokkal rendelkeznek;

**Mobil tartány:** a 6.7 fejezetben, ill. az IMDG Kódexben található meghatározás szerinti, multimodális tartány, amelyhez a 3.2 fejezet „A” táblázat 10 oszlopában mobil tartány utasítás (T-jel) van feltüntetve; amennyiben a 2 osztály anyagainak szállítására használják, 450 liternél nagyobb befogadóképességű;

**Műanyagszövet** (hajlékony falú IBC-knél): alkalmas műanyagból álló nyújtott szalagokból vagy monoszálakból készült anyag;

**Műszaki megnevezés:** elfogadott kémiai – adott esetben biológiai – megnevezés, vagy a tudományos és műszaki kézikönyvekben, folyóiratokban és egyéb szakirodalomban jelenleg használt, egyéb megnevezés (lásd a 3.1.2.8.1.1 pontot);

**N**

**Nagycsomagolás:** olyan csomagolóeszköz, amelynél a belső csomagolások vagy tárgyak egy külső csomagolóeszközbe vannak helyezve és

- a) gépi mozgatásra alkalmas kivitelű;
- b) befogadóképessége meghaladja a 400 kg nettó tömeget, ill. a 450 litert, de legfeljebb 3 m<sup>3</sup>;

**Nagykonténer:** lásd *konténer*;

**Nagyméretű csomagolóeszköz (IBC):** a 6.1 fejezetben nem említett, merev vagy hajlékony falú, szállítható csomagolóeszköz, amelynek

- a) űrtartalma
  - i) nem haladja meg a 3 m<sup>3</sup>-t a II és a III csomagolási csoportba tartozó, szilárd és folyékony anyagok esetében;
  - ii) nem haladja meg az 1,5 m<sup>3</sup>-t az I csomagolási csoportba tartozó, szilárd anyagok esetében, ha azok hajlékony falú, merev falú műanyag, összetett, papírlemez vagy fa IBC-kbe vannak csomagolva;
  - iii) nem haladja meg a 3 m<sup>3</sup>-t az I csomagolási csoportba tartozó, szilárd anyagok esetében, ha azok fém IBC-kbe vannak csomagolva;
  - iv) nem haladja meg a 3 m<sup>3</sup>-t a 7 osztály radioaktív anyagai esetében;
- b) gépi mozgatásra alkalmas kivitelű;
- c) a szállítás és kezelés során fellépő erőhatásoknak oly módon áll ellen, mint azt a 6.5 fejezet szerinti próbák meghatározzák (lásd még *fa IBC*, *fém IBC*, *hajlékony falú IBC*, *merev falú műanyag IBC*, *összetett IBC műanyag belső tartállyal* és *papírlemez IBC*);

**Megjegyzés:** 1. A 6.7 fejezet előírásainak megfelelő mobil tartányok, ill. a 6.8 fejezet előírásainak megfelelő tankkonténerek nem tekinthetők IBC-knek.

2. A 6.5 fejezet előírásainak megfelelő IBC-k a RID értelmében nem tekinthetők konténereknek.

Az **átalakított IBC** olyan fém, merev falú műanyag vagy összetett IBC,

- a) amelyet nem UN típusból alakítottak át UN típusúvá; vagy
- b) amelyet valamely UN típusból egy másik UN típusúvá alakítottak át.

Az átalakított IBC-kre a RID ugyanazon követelményei vonatkoznak, mint amelyeket az azonos típusú, új IBC-kre kell alkalmazni (lásd még a gyártási típus meghatározását a 6.5.6.1.1 pontban).

A **javított IBC** olyan fém, merev falú műanyag vagy összetett IBC, amely ütődés vagy bármilyen más ok (pl. korrózió, ridegedés, a gyártási típushoz képest gyengült ellenállóképesség) miatt kijavítottak, hogy megegyezzen a gyártási típussal és képes legyen a gyártási típus vizsgálatok elviselésére. Az összetett IBC-k merev falú műanyag belső tartályának a cseréje a gyártó eredeti specifikációja szerinti belső tartályra a RID értelmében az IBC javításának minősül. A merev falú IBC-k rendszeres karbantartása azonban nem minősül javításnak. A merev falú műanyag IBC testeken és az összetett IBC-k belső tartályán nem végezhető javítás. A hajlékony falú IBC-k csak az illetékes hatóság engedélyével javíthatók;

A **hajlékony falú IBC rendszeres karbantartása** a hajlékony falú, műanyag vagy textilszövet IBC-ken a következő, rendszeresen elvégzett munkákat jelenti:

- a) tisztítás; vagy
- b) az IBC szerves részét nem képező alkotóelemek, pl. különálló bélések és zárószalagok cseréje a gyártó eredeti előírásainak megfelelővel;

amennyiben ez az IBC árumegtartó funkcióját nem befolyásolja kedvezőtlenül, ill. az IBC gyártási típusát nem változtatja meg;

A **merev falú IBC rendszeres karbantartása** a fém, merev falú műanyag és összetett IBC-ken a következő, rendszeresen elvégzett munkákat jelenti:

- a) tisztítás;
- b) a zárószervezetek (beleértve a hozzátartozó tömítéseket) vagy az üzemi szerelvények eltávolítása és visszahelyezése vagy a gyártó eredeti előírásainak megfelelővel való cseréje, feltéve, hogy az IBC tömörségét ellenőrzik; vagy
- c) a veszélyes áru megtartására vagy az ürítési nyomás fenntartására közvetlenül nem szolgáló szerkezeti szerelvények kijavítása (pl. a tartólábak, emelő tartozékok helyreigazítása), hogy megegyezzenek a gyártási típussal, amennyiben ez az IBC megtartó funkcióját nem befolyásolja;

**Nagypalack:** varrat nélküli, szállításra használt, nyomástartó tartály 150 liternél nagyobb, de legfeljebb 3000 liter űrtartalommal;

**Ny**

**Nyitott kocsi:** homlok- és oldalfalakkal ellátott, vagy anélküli kocsi, amelynek rakfelülete nyitott;

**Nyitott konténer:** lásd **konténer**;

**Nyomástartó tartály:** gyűjtőfogalom, amelyhez a palackok, a nagypalackok, a gázhordók, a zárt mélyhűtő tartályok és a palackkötegek tartoznak;

## O

**„Offshore” ömlesztettáru-konténer:** olyan többször használható ömlesztettáru-konténer, amelyet speciálisan nyílt tengeri létesítményekhez, létesítményektől, ill. létesítmények közötti szállításra terveztek. Az „offshore” ömlesztettáru-konténert a nyílt tengeren kezelt „offshore” konténerekre vonatkozó jóváhagyási útmutató szerint kell tervezni és gyártani, amit a Nemzetközi Tengerészeti Szervezet (IMO) MSC/Circ.860 dokumentuma tartalmaz;

**Orsó (az 1 osztályban):** műanyagból, fából, papírlémezről, fémből vagy egyéb alkalmas anyagból készített eszköz központi tengellyel és a tengely mindkét végén oldalsó tárcsával vagy anélkül. Az anyagok és tárgyak a tengely köré tekerelhetők és azokat az oldalsó tárcsák tarthatják meg;

**OTIF:** Intergovernmental Organization for International Carriage by Rail (Nemzetközi Vasúti Fuvarozási Államközi Szervezet) (OTIF, Gryphenhübeliweg 30, CH-3006 Bern, Svájc);

## Ö

**ÖBH:** lásd *Öngyorsuló bomlási hőmérséklet*;

**Ömlesztettáru-konténer:** olyan megtartó rendszer (beleértve mindenfajta bélést és bevonatot), amely a vele közvetlenül érintkező szilárd anyag szállítására szolgál. A csomagolóeszközök, IBC-k, nagycsomagolások és tartályok nem tartoznak ide.

Az ömlesztettáru-konténer

- tartós jellegű és ennek megfelelően elég szilárd ahhoz, hogy ismételten felhasználható legyen;
- kifejezetten úgy van kialakítva, hogy megkönnyítse az áruknak egy vagy több szállítási móddal – a rakomány megbontása nélkül – történő szállítását;
- a könnyű kezelhetőséget lehetővé tevő elemekkel van ellátva;
- befogadóképessége legalább 1,0 m<sup>3</sup>.

Ömlesztettáru-konténer lehet pl. konténer, „offshore” ömlesztettáru-konténer, billenő-puttony, ömlesztettáru-siló, cserefelépítmény, konténerteknő, görgős konténer, a kocsik rakodótere;

**Ömlesztett fuvarozás:** csomagolatlan szilárd anyagok vagy tárgyak fuvarozása vasúti kocsikban vagy konténerekben. A fogalom nem vonatkozik sem a küldeménydarabokban, sem a tartályokban fuvarozott árukra;

**Öngyorsuló bomlási hőmérséklet (ÖBH):** az a legalacsonyabb hőmérséklet, amelynél a szállítás során használt csomagolásban levő anyagnál az öngyorsuló bomlás bekövetkezhet. Az ÖBH meghatározására vonatkozó követelményeket és a zárt térben történő hevítés hatását a „Vizsgálatok és kritériumok kézikönyv” II. része tartalmazza. [Az öngyorsuló bomlási hőmérséklet (ÖBH) a francia *temperature de decomposition auto-accélerée* (TDAA), ill. az angol *self-accelerating decomposition temperature* (SADT) magyar megfelelője.];

**Összetett IBC műanyag belső tartállyal:** olyan IBC, amely merev külső burkolatot képező vázszerkezetből áll, amely a műanyag belső tartályt, valamint a megfelelő üzemi és szerkezeti szerelvényeket veszi körül. Kialakítása olyan, hogy a belső tartály és a külső burkolat összeszerelve szétválaszthatatlan egységet képez és így töltik, tárolják, szállítják vagy ürítik;

**Megjegyzés:** A „műanyag” az összetett IBC-knél a belső tartállyal kapcsolatosan használva az egyéb polimer anyagokat, mint pl. a gumit is jelenti.

**Összetett (műanyag) csomagolóeszköz:** belső műanyag tartályból és külső (fém, papírlemez, rétegelt falemez stb.) csomagolásból álló csomagolóeszköz. Ez a csomagolóeszköz, ha egyszer már összeállították, szétválaszthatatlan marad, így töltik, raktározzák, szállítják és ürítik;

**Megjegyzés:** Lásd az összetett (üveg, porcelán, kőagyag) csomagolóeszközhöz fűzött megjegyzést.

**Összetett (üveg, porcelán, kőagyag) csomagolóeszköz:** belső üveg-, porcelán- vagy kőagyag tartályból és külső (fém, fa, papírlemez, műanyag, habosított műanyag stb.) csomagolásból áll. Ez a csomagolóeszköz, ha egyszer összeállították, szétválaszthatatlan marad, így töltik, raktározzák, fuvarozzák és ürítik;

**Megjegyzés:** Egy „összetett csomagolóeszköz” „belső elemét” a szokásos körülmények között „belső tartálynak” nevezik. Például egy 6HA1 típusú összetett (műanyag) csomagolóeszköz „belső eleme” egy ilyen fajta „belső tartály”, mivel ezt a szokásos körülmények között nem arra alakították ki, hogy „külső csomagolás” nélkül „befogadó” funkciót lásson el, és így nem „belső csomagolásról” van szó.

## P

**Palack:** legfeljebb 150 liter űrtartalmú, szállításra használt, nyomástartó tartály;

**Palackköteg:** szállításra használt, szerkezeti egységbe épített palackok, amelyek egymással gyűjtőcsővel vannak összekötve és szilárdan egymáshoz vannak erősítve. A palackok együttes űrtartalma legfeljebb 3000 liter lehet, a 2 osztály mérgező (a 2.2.2.1.3 pont szerint T betűvel kezdődő csoportba tartozó) gázainak szállítására használt palackkötegek űrtartalma azonban legfeljebb 1000 liter lehet;

**Papírlemez IBC:** papírlemez testből különálló fenékkal és tetővel vagy anélkül, szükség esetén béléssel (de nem belső csomagolással), és megfelelő szerkezeti és üzemi szerelvényekből álló IBC;

**Ponyvás kocsi:** a berakott áru védelme érdekében ponyvával ellátott nyitott kocsi;

**Ponyvás konténer:** lásd *konténer*;

**Portömör csomagolóeszköz:** olyan csomagolóeszköz, amely nem engedi át a szilárd tartalmat, beleértve a szállítás alatt keletkező finom szilárd anyagot is;

**Próbanyomás:** az üzembe helyezés előtti, ill. az időszakos vizsgálat alkalmával végzett nyomáspróba során kifejtett nyomás (lásd még *legnagyobb üzemi nyomás (túlnyomás)*, *tervezési nyomás*, *töltési nyomás* és *ürítési nyomás*);

**Megjegyzés:** A mobil tartányokra lásd a 6.7 fejezetet.

## R

**Radioaktív tartalom (a 7 osztály anyagainak szállításánál):** a csomagolásban együtt levő radioaktív anyag bármely szennyezett vagy felaktivált szilárd vagy folyékony anyaggal és gázzal;

**Referencia acél:** a 370 N/mm<sup>2</sup> szakítószilárdságú és 27% szakadási nyúlású acél;

**Rekesz:** rácsos kialakítású (nem teljes falú) külső csomagolóeszköz;

**Rögzített tartány:** szerkezetiileg tartósan a vasúti kocsira szerelt, legalább 1000 liter befogadóképességű tartány (a kocsi ily módon tartálykocsivá válik) vagy egy ilyen kocsi alvázának elválaszthatatlan részét képező tartány;

**S**

**Sugárzási szint** (a 7 osztály anyagainak szállításánál): a megfelelő sugárzásra vonatkozó dózis-teljesítmény millisievert per óra egységben megadva;

**Sz**

**Szabályozási hőmérséklet:** az a legmagasabb hőmérséklet, amelyen a szerves peroxid vagy az önreaktív anyag biztonságosan szállítható;

**Szállítási mutatószám (Transport index, TI) küldeménydarabhoz, egyesítőcsomagoláshoz, konténerhez vagy csomagolatlan LSA-I vagy SCO-I küldeményhez** (a 7 osztály anyagainak szállításánál): olyan szám, amelyet a besugárzás ellenőrzésére használnak;

**Szerkezeti acél:** a 360...440 N/mm<sup>2</sup> közötti legkisebb szakítószilárdságú acél;

**Megjegyzés:** A mobil tartányokra lásd a 6.7 fejezetet.

**Szerkezeti szerelvény:**

- a) tartálykocsi esetében a tartány külső vagy belső erősítő- és rögzítő- vagy védő-elemei;
- b) tankkonténer esetében a tartány külső vagy belső erősítő- és rögzítő-, védő- vagy stabilizáló-elemei;

**Megjegyzés:** A mobil tartányokra lásd a 6.7 fejezetet.

- c) a battériás kocsi vagy MEG-konténer elemei esetében a tartány vagy a tartály külső erősítő-, rögzítő-, védő- vagy stabilizáló-elemei;
- d) a hajlékony falú IBC-eket kivéve minden más IBC típusnál a test erősítő-, rögzítő-, kezelő, védő- vagy stabilizáló-elemei (beleértve a belső műanyag tartállyal rendelkező összetett IBC-k esetében a raklap alapot is);

**Szilárd anyag:**

- a) amelynek olvadáspontja vagy olvadás kezdőpontja 101,3 kPa nyomáson 20 °C-nál magasabb; vagy
- b) az ASTM D 4359-90 vizsgálati módszerrel meghatározva nem folyékony, vagy a 2.3.4 szakaszban leírt folyékonyág meghatározási vizsgálat (penetrométer eljárás) kritériumai szerint pasztaszerű;

**T**

**Tálca** (az 1 osztályban): fém, műanyag, papírlemez vagy más alkalmas anyagú lemez, amelyet a belső, a köztes vagy a külső csomagolásba helyeznek és azokba szorosan illeszkedik. A tálca felülete lehet alakos, hogy a csomagolások vagy tárgyak beültethetők, szilárdan rögzíthetők és egymástól elválaszthatók legyenek;

**Tankkonténer:** gáz alakú, folyékony, porszerű vagy szemcsés anyagok szállítására használt, a konténer meghatározásnak megfelelő szállítóeszköz, amely a tartányból és szerelvényeiből áll, beleértve azokat a szerelvényeket is, amelyek lehetővé teszik a tankkonténer helyváltoztatását egyensúlyhelyzete jelentős megváltoztatása nélkül; amennyiben a 2 osztály anyagainak szállítására használják, 450 liternél nagyobb befogadóképességű;

**Megjegyzés:** A 6.5 fejezet előírásainak megfelelő IBC-k nem tekinthetők tankkonténereknek.

**Tankkonténer, mobil tartány vagy tartálykocsi üzemben tartója:** az a vállalkozás, amelynek

a nevén a tankkonténert, a mobil tartányt vagy a tartálykocsit nyilvántartásba vették; vagy szokásos módon forgalomba helyezték;

**Tartály** (az 1 osztályban): köztes vagy belső csomagolásként használt láda, palack, hordó, kanna, doboz és hüvely, beleértve mindenféle zárószervezetüket;

**Tartály:** anyagok vagy tárgyak befogadására vagy tartására alkalmas befogadóedény, beleértve mindenfajta zárószervezetét is. Ez a meghatározás a tartányokra nem vonatkozik (lásd még *belső tartály, gázpatron, mélyhűtő tartály, merev belső tartály és nyomástartó tartály*);

**Tartálykocsi:** folyékony, gáznemű, porszerű vagy szemcsés anyagok fuvarozására használt kocsi, amely egy vagy több tartányt magába foglaló felépítményből és azok szerelvényeiből, valamint egy, a saját szerelvényeivel ellátott alvázból (futómű, felfüggesztés, vonó- és ütközőberendezés, fékek és feliratok) áll;

**Megjegyzés:** A leszerelhető tartányos kocsik is tartálykocsinak minősülnek.

**Tartály névleges űrtartalma:** a tartályban található veszélyes áru literben kifejezett névleges térfogata. A sűrített gázok tartályainál ez megegyezik a víztöltet térfogatával;

**Tartány:** maga a tartányköpeny, beleértve annak üzemi és szerkezeti szerelvényeit. Ahol a tartány szó önmagában szerepel, tankkonténert, mobil tartányt, leszerelhető tartányt vagy tartálykocsit jelent az ebben a részben szereplő meghatározás szerint, ill. olyan tartányt, amely a battériás kocsi vagy a MEG-konténer elemét képezi (lásd még *leszerelhető tartány, MEG-konténer, mobil tartány, battériás kocsi és tartálykocsi*);

**Megjegyzés:** A mobil tartányokra lásd a 6.7.4.1 bekezdést.

**Tartány, ill. tartánykamra befogadóképessége (űrtartalma):** a tartány, ill. tartánykamra teljes belső térfogata, literben vagy m<sup>3</sup>-ben kifejezve. Ha a tartányt, ill. tartánykamrát az alakja vagy a szerkezeti kialakítása miatt nem lehet teljesen feltölteni, akkor a töltési fok meghatározásánál és a tartány jelölésénél a csökkentett befogadóképességet kell alapul venni;

**Tartány-vizsgálati könyv (gépkönyv):** olyan dokumentáció, amely tartalmazza a tartányra, battériás kocsira, ill. MEG-konténerre vonatkozóan az összes fontos műszaki adatot, mint például a 6.8.2.3, a 6.8.2.4 és a 6.8.3.4 bekezdésben említett bizonyítványokat, ill. tanúsítványokat;

**Tartányköpeny:** az anyagot tartalmazó burkolat (beleértve a nyílásokat és zárószervezeteiket);

**Megjegyzés:** 1. Ez a meghatározás nem vonatkozik a tartályokra.

2. A mobil tartányokra lásd a 6.7 fejezetet.

**Tartányos cserefelépítmény:** a tartányos cserefelépítmény tankkonténernek tekintendő;

**Teljes rakomány:** egyetlen feladótól származó rakomány, amely részére egy nagykonténer kizárólagos használatra van fenntartva, és amelynek be- és kirakását a feladó vagy a címzett utasításai szerint végzik;

**Megjegyzés:** A 7 osztálynál a megfelelő kifejezés a., kizárólagos használat”.

**Tervezési nyomás:** a próbanyomással legalább egyenlő elméleti nyomás, amely a szállított anyag veszélyességi foka szerint kisebb vagy nagyobb mértékben meghaladhatja az üzemi nyomást. A tervezési nyomás csak a tartány falvastagságának meghatározására való a külső és belső erősítőelemek figyelembe vétele nélkül (lásd még *legnagyobb üzemi nyomás (túlnyomás), próbanyomás, töltési nyomás és ürítési nyomás*);

**Megjegyzés:** A mobil tartányokra lásd a 6.7 fejezetet.

**Test** (az összetett IBC-ek kivéve minden más IBC típusnál): maga a tartály, beleértve a nyílásokat és azok zárószerkezeteit, de kizárva az üzemi szerelvényeket;

**Többelemes gázkonténer (MEG-konténer):** olyan szállítóeszköz, amelynek egymással gyűjtőcsővel összekötött és vázra szerelt elemei vannak. A következő elemek tekinthetők a többelemes gázkonténer elemeinek: palackok, nagypalackok, gázhordók, palackkötegek és a 2 osztály gázainak szállítására készült, 450 liternél nagyobb befogadóképességű tartányok;

**Megjegyzés:** Az UN MEG-konténerekre lásd a 6.7 fejezetet.

**Töltési fok:** a gáz tömegének és a felhasználásra kész nyomástartó tartályt teljesen kitöltő víz tömegének aránya 15 °C-on;

**Töltési nyomás:** az a legnagyobb nyomás, amely a tartányban a nyomás alatti töltéskor ténylegesen fellép (lásd még legnagyobb üzemi nyomás (túlnyomás), próbanyomás, tervezési nyomás és ürítési nyomás);

**Töltő:** bármely vállalkozás, amely a veszélyes árut tartányba (tartálykocsiba, leszerelhető tartányba, mobil tartányba vagy tankkonténerbe), battériás kocsiba vagy MEG-konténerbe tölti, ill. az ömlesztett veszélyes árut vasúti kocsiba, nagykonténerbe vagy kiskonténerbe rakja;

**Tömörégi próba:** tartányok, csomagolóeszközök vagy IBC-k, szerelvények és zárószerkezetek szivárgásmentességének meghatározására szolgáló vizsgálat;

**Megjegyzés:** A mobil tartányokra lásd a 6.7 fejezetet.

**Transport index (TI):** lásd szállítási mutatószám (TI);

**Túlnyomásos gázpatron:** lásd aeroszol vagy aeroszol csomagolás;

## U

**UIC:** Union Internationale des Chemins de Fer (Nemzetközi Vasútegylet), (UIC, 16 rue Jean Rey, F-75015 Paris, France);

**UNECE:** United Nations Economic Commission for Europe (ENSZ Európai Gazdasági Bizottság), (UNECE, Palais des Nations, 8-14 avenue de la Paix, CH-1211 Geneva 10, Switzerland);

**UN szám (azonosító szám):** az anyagok és tárgyak négyjegyű azonosító száma, amely az „ENSZ Minta Szabályzat”-ból származik;

## Ü

**Ürítési nyomás:** az a legnagyobb nyomás, amely a tartányban a nyomás alatti ürítéskor ténylegesen fellép (lásd még legnagyobb üzemi nyomás (túlnyomás), próbanyomás, tervezési nyomás és töltési nyomás);

**Üzemi nyomás:** a sűrített gáz állandósult nyomása a megtöltött nyomástartó tartályban 15 °C referencia hőmérsékleten;

**Megjegyzés:** Tartányokra lásd a legnagyobb üzemi nyomás (túlnyomás) fogalmát.

### Üzemi szerelvények:

- tartányoknál a töltő- és ürítő-, a szellőző-, a biztonsági, a fűtő- és hőszigetelő berendezések, valamint a mérőeszközök;

**Megjegyzés:** A mobil tartányokra lásd a 6.7 fejezetet.

- b) battériás kocsí vagy MEG-konténer elemeinél a töltő-, ürítő- és biztonsági berendezések, az összekötő csövek, valamint a mérőeszközök;
- c) IBCk-nél a töltő- és ürítő-, a nyomáscsökkentő-, szellőző-, a fűtő- és hőszigetelő-berendezések, valamint a mérőeszközök;

## V

**Vákuum-szelep:** nyomáskülönbség hatására automatikusan működésbe lépő, rugóterhelésű szerkezet, amelynek feladata a nem megengedett vákuum kialakulásának megakadályozása a tartányban;

**Vállalat:** lásd **vállalkozás**;

**Vállalkozás:** a természetes személy vagy jogi személy, függetlenül attól, hogy folytat-e jövedelemszerző tevékenységet; a jogi személyiség nélküli társaság vagy személyek társulása, függetlenül attól, hogy folytat-e jövedelemszerző tevékenységet; a hivatalos testületet, függetlenül attól, hogy rendelkezik-e jogi személyiséggel, vagy hogy jogi személyiséggel rendelkező hatóságtól függ-e;

**Vasúti infrastruktúra:** minden vasúti vágány és rögzített berendezés, amely a vasúti járművek közlekedéséhez és a közlekedés biztonságához szükséges;

**Vasúti infrastruktúra üzemeltetője (pályavasút):** bármely állami szervezet vagy vállalkozás, amelynek feladata a vasúti pályának és tartozékainak létesítése, karbantartása, valamint a üzemviteli és biztonsági rendszer irányítása;

**Védett IBC (fém IBC-nél):** az ütközéssel szembeni kiegészítő védelemmel ellátott IBC, ez a védelem lehet pl. többrétegű (szendvicsszerkezetű) vagy kettős falú konstrukció vagy fémrácsos vázszerkezet;

**Veszélyes áruk:** olyan anyagok és tárgyak, amelyek fuvarozását a RID tiltja vagy csak feltételekkel engedi meg;

**Veszélyes reakció:**

- a) égés és/vagy jelentős hőfejlődés;
- b) gyúlékony, fojtó hatású, gyújtó hatású (oxidáló) és/vagy mérgező gázok fejlődése;
- c) maró anyagok képződése;
- d) vegyileg nem állandó anyagok képződése; vagy
- e) veszélyes nyomásnövekedés (csak tartányoknál);

**Vészhőmérséklet:** az a hőmérséklet, amelynél a hőmérséklet-szabályozás megszűnése esetén a vészhelyzeti eljárásokat alkalmazni kell;

**Visszaforgatott műanyag:** használt ipari csomagolóeszközökből visszanyert anyag, melyet új csomagolóeszközzé való feldolgozásához megtisztítanak és előkészítenek;

**Vizsgálatok és kritériumok kézikönyv:** az ENSZ „Ajánlások a veszélyes áruk szállítására, Vizsgálatok és kritériumok kézikönyv” negyedik javított kiadása (az ST/SG/AC.10/11/Rev.4/Amend.1. és az ST/SG/AC.10/11/Rev.4/Amend.2 jelű dokumentummal módosított ST/SG/AC.10/11/Rev.4);

**Vizsgáló szervezet:** az illetékes hatóság által elismert, független vizsgáló szervezet;

**Z**

**Zárószervezet:** a tartály nyílását záró szerkezet;

**Zárt konténer:** lásd *konténer*;

**ZS**

**Zsák:** papírból, műanyag fóliából, textiltől, szövött anyagból vagy más alkalmas anyagból készült hajlékony csomagolóeszköz.

## 1.2.2 Mértékegységek

### 1.2.2.1 A RID-ben a következő mértékegységek<sup>4)</sup> alkalmazhatók

Fizikai mennyiség	SI-egység <sup>5)</sup>		Egyéb engedélyezett mértékegység		A mértékegységek közötti arány
	neve	jele	neve	jele	
Hosszúság	méter	m	—	—	
Terület, felület	négyszetméter	m <sup>2</sup>	—	—	
Térfogat	köbméter	m <sup>3</sup>	liter	l <sup>6)</sup>	1 l = 10 <sup>-3</sup> m <sup>3</sup>
Idő	másodperc	s	perc óra nap	min h d	1 min = 60 s 1 h = 3600 s 1 d = 86 400 s
Tömeg	kilogramm	kg	gramm tonna	g t	1 g = 10 <sup>-3</sup> kg 1 t = 10 <sup>3</sup> kg
Sűrűség	—	kg/m <sup>3</sup>	—	kg/l	1 kg/l = 10 <sup>3</sup> kg/m <sup>3</sup>
Hőmérséklet	kelvin	K	Celsius-fok	°C	0 °C = 273,15 K
Hőmérséklet-különbség	kelvin	K	Celsius-fok	°C	1 °C = 1 K
Erő	newton	N	—	—	1 N = 1 kg·m/s <sup>2</sup>
Nyomás	Pascal	Pa	bar	bar	1 bar = 10 <sup>5</sup> Pa 1 Pa = 1 N/m <sup>2</sup>
Mechanikai feszültség	—	N/m <sup>2</sup>	—	N/mm <sup>2</sup>	1 N/mm <sup>2</sup> = 1 MPa
Munka Energia Hőmennyiség	joule	J	kilowattóra elektronvolt	kWh eV	1 kWh = 3,6 MJ 1 J = 1 N·m = 1 W·s 1 eV = 0,1602·10 <sup>-18</sup> J
Teljesítmény					
Kinematikai viszkozitás					
Dinamikai viszkozitás	—	Pa·s	—	mPa·s	1 mPa·s = 10 <sup>-3</sup> Pa·s
Aktivitás	becquerel	Bq	—	—	—
Dózisegyenérték	sievert	Sv	—	—	—

- 4) A korábbi, már nem törvényes mértékegységekkel adott mennyiség értékek törvényes mértékegységű értékre való átszámításához a következő kerekített értékeket kell alkalmazni:

**Erő:**

$$\begin{aligned} 1 \text{ kg} &= 9,807 \text{ N} \\ 1 \text{ N} &= 0,102 \text{ kg} \end{aligned}$$

**Mechanikai feszültség:**

$$\begin{aligned} 1 \text{ kg/mm}^2 &= 9,807 \text{ N/mm}^2 \\ 1 \text{ N/mm}^2 &= 0,102 \text{ kg/mm}^2 \end{aligned}$$

**Nyomás:**

$$\begin{aligned} 1 \text{ Pa} &= 1 \text{ N/m}^2 = 10^{-5} \text{ bar} = 1,02 \cdot 10^{-5} \text{ kg/cm}^2 = 0,75 \cdot 10^{-2} \text{ Torr} \\ 1 \text{ bar} &= 10^5 \text{ Pa} = 1,02 \text{ kg/cm}^2 = 750 \text{ Torr} \\ 1 \text{ kg/cm}^2 &= 9,807 \cdot 10^4 \text{ Pa} = 0,9807 \text{ bar} = 736 \text{ Torr} \\ 1 \text{ Torr} &= 1,33 \cdot 10^2 \text{ Pa} = 1,33 \cdot 10^{-3} \text{ bar} = 1,36 \cdot 10^{-3} \text{ kg/cm}^2 \end{aligned}$$

**Munka, energia, hőmennyiség:**

$$\begin{aligned} 1 \text{ J} &= 1 \text{ N} \cdot \text{m} = 0,278 \cdot 10^{-6} \text{ kWh} = 1,102 \text{ kg} \cdot \text{m} = 0,239 \cdot 10^{-3} \text{ kcal} \\ 1 \text{ kWh} &= 3,6 \cdot 10^6 \text{ J} = 367 \cdot 10^3 \text{ kg} \cdot \text{m} = 860 \text{ kcal} \\ 1 \text{ kg} \cdot \text{m} &= 9,807 \text{ J} = 2,72 \cdot 10^{-6} \text{ kWh} = 2,34 \cdot 10^{-3} \text{ kcal} \\ 1 \text{ kcal} &= 4,19 \cdot 10^3 \text{ J} = 1,16 \cdot 10^{-3} \text{ kWh} = 427 \text{ kg} \cdot \text{m} \end{aligned}$$

**Teljesítmény:**

$$\begin{aligned} 1 \text{ W} &= 0,102 \text{ kg} \cdot \text{m/s} = 0,86 \text{ kcal/h} \\ 1 \text{ kg} \cdot \text{m/s} &= 9,807 \text{ W} = 8,43 \text{ kcal/h} \\ 1 \text{ kcal/h} &= 1,16 \text{ W} = 0,119 \text{ kg} \cdot \text{m/s} \end{aligned}$$

**Kinematikai viszkozitás:**

$$\begin{aligned} 1 \text{ m}^2/\text{s} &= 10^4 \text{ St (stokes)} \\ 1 \text{ St} &= 10^{-4} \text{ m}^2/\text{s} \end{aligned}$$

**Dinamikai viszkozitás:**

$$\begin{aligned} 1 \text{ Pa} \cdot \text{s} &= 1 \text{ N} \cdot \text{s/m}^2 = 10 \text{ P (poise)} = 0,102 \text{ kg} \cdot \text{s/m}^2 \\ 1 \text{ P} &= 0,1 \text{ Pa} \cdot \text{s} = 0,1 \text{ N} \cdot \text{s/m}^2 = 1,02 \cdot 10^{-2} \text{ kg} \cdot \text{s/m}^2 \\ 1 \text{ kg} \cdot \text{s/m}^2 &= 9,807 \text{ Pa} \cdot \text{s} = 9,807 \text{ N} \cdot \text{s/m}^2 = 98,07 \text{ P} \end{aligned}$$

- 5) A Nemzetközi mértékegységrendszer (SI) az Általános Súly- és Mértékügyi Értekezlet határozatainak eredménye (Cím: Pavillon de Breteuil, Parc de St-Cloud, F-92 310 Sèvres)
- 6) Írógép használata esetén a literre vonatkozó „l” rövidítés mellett az „L” rövidítés is megengedett.

A mértékegységek többszöröseit és törtrészeit a mértékegységek jele elé tett, egy szorzót jelentő, következő prefixumok (SI-prefixumok) egyikével lehet képezni.

Szorzó			A prefixum neve	A prefixum jele
1 000 000 000 000 000 000 =	$10^{18}$	trillió	exa	E
1 000 000 000 000 000 =	$10^{15}$	billiárd	peta	P
1 000 000 000 000 =	$10^{12}$	billió	tera	T
1 000 000 000 =	$10^9$	milliárd	giga	G
1 000 000 =	$10^6$	millió	mega	M
1 000 =	$10^3$	ezer	kilo	k
100 =	$10^2$	száz	hekto	h
10 =	$10^1$	tíz	deka	da
0,1 =	$10^{-1}$	tized	deci	d
0,01 =	$10^{-2}$	század	centi	c
0,001 =	$10^{-3}$	ezred	milli	m
0,000 001 =	$10^{-6}$	milliomod	mikro	$\mu$
0,000 000 001 =	$10^{-9}$	milliárdod	nano	n
0,000 000 000 001 =	$10^{-12}$	billiomod	piko	p
0,000 000 000 000 001 =	$10^{-15}$	billiárdod	femto	f
0,000 000 000 000 000 001 =	$10^{-18}$	trilliomod	atto	a

#### 1.2.2.2

Kifejezett ellentétes meghatározás hiányában a „%” a RID-ben a következőket jelenti:

- szilárd vagy folyékony anyagok keveréke, valamint oldatok és folyadékokkal átitatott szilárd anyagok esetén a keverék, az oldat vagy az átitatott anyag teljes tömegére vonatkoztatott tömeg%-ot;
- sűrített gázkeverékek esetén: ha a töltés nyomásra történik, a térfogatarányt a gázkeverék teljes térfogatának százalékában megadva; vagy ha a töltés tömegre történik, a tömegarányt a gázkeverék teljes tömegének százalékában megadva;
- cseppfolyósított gázkeverék, valamint oldott gázkeverék esetén: a tömegarányt a gázkeverék teljes tömegének százalékában megadva.

#### 1.2.2.3

A tartályokra vonatkozó mindenféle nyomás (pl. próbanyomás, belső nyomás, a biztonsági szelepek nyitónyomása) mindig túlnyomásban van megadva (a légköri nyomáshoz viszonyított túlnyomásban); ezzel szemben a gőznyomás mindig abszolút nyomásban van kifejezve.

#### 1.2.2.4

Ha a RID töltési fokot ír elő tartályokra vagy tartányokra, ez mindig 15 °C anyag-hőmérsékletre vonatkozik, kivéve, ha más hőmérséklet van megjelölve.

## 1.3 fejezet

### A veszélyes áruk fuvarozásában résztvevő személyek képzése

#### 1.3.1 Alkalmazási terület

Az 1.4 fejezetben hivatkozott résztvevők által alkalmazott, veszélyes áruk fuvarozásával kapcsolatos munkakört ellátó személyeknek feladatukhoz és felelősségükhöz igazodó képzésben kell részesülniük a veszélyes árukra vonatkozó előírásokból. A veszélyes árukkal kapcsolatos közbiztonsági előírásokról szóló 1.10 fejezet képzési követelményeit is figyelembe kell venni.

**Megjegyzés:** 1. A biztonsági tanácsadó képzésére lásd az 1.8.3 szakaszt.

2. (fenntartva)

3. A 7 osztályra vonatkozó képzésre lásd az 1.7.2.5 bekezdést is.

4. A személyzetet még a veszélyes áruk szállításával kapcsolatos feladat megkezdése előtt kell a képzésben részesíteni.

#### 1.3.2 A képzés jellege

Az érintett személyek feladatához és felelősségéhez igazodva a következő képzés szükséges:

##### 1.3.2.1 Általános tájékoztató oktatás

A személyzetnek meg kell ismernie a veszélyes áruk fuvarozására vonatkozó általános előírásokat.

##### 1.3.2.2 Munkakörre (feladatra) szakosított oktatás

A személyzetet feladatával és felelősségével arányban álló részletességgel ki kell oktatni a veszélyes áruk fuvarozására vonatkozó előírásokra.

Ha a veszélyes árut multimodális szállítással továbbítják, a többi szállítási módra vonatkozó előírásokat is ismertetni kell.

Ezenkívül a fuvarozónak és a vasúti infrastruktúra üzemeltetőjének a személyzetét a vasúti fuvarozás különlegességeire is ki kell oktatni. Az oktatást alapozó és szakosító oktatás formájában kell nyújtani.

a) Alapozó oktatás a teljes személyzet számára:

A teljes személyzetet ki kell oktatni a veszélyességi bárcák és a narancssárga jelölés jelentésére. Ezenkívül a személyzettel meg kell ismertetni a szabálytalanságok jelentési eljárását.

b) A szakosító oktatás a veszélyes áruk fuvarozásában közvetlenül érintett üzemi személyzet számára:

Az előző a) pontban említett alapozó oktatáson kívül a személyzetet tevékenységüktől függően kell oktatásban részesíteni.

A szakosító oktatás témáit a személyzet számára az 1.3.2.2.1 pont szerinti csoportok és az 1.3.2.2.2 pont szerinti három kategória alapján kell meghatározni.

**1.3.2.2.1**

A személyzet csoportosítására az egyes kategóriákba a következő táblázat szolgál:

Csoport	A kategória leírása	Személyzet
1	a veszélyes áruk fuvarozásában közvetlenül érintett üzemi személyzet	vontatójármű-vezetők, kocsirendezők, ill. ennek megfelelő feladatot ellátó személyek
2	a veszélyes áruk fuvarozásához használt kocsik műszaki ellenőrzéséért felelős személyzet	kocsivizsgálók, ill. ennek megfelelő feladatot ellátó személyek
3	a forgalmi és rendezési szolgálat irányításáért és ellenőrzéséért felelős személyzet, a vasúti infrastruktúra üzemeltető vezetősége	forgalmi szolgálattevők, váltókezelők, irányítóközpontok személyzete, ill. ennek megfelelő feladatot ellátó személyek

**1.3.2.2.2**

A szakosító oktatásnak legalább a következő témákra kell kiterjednie:

- a) az 1 kategóriába tartozó vontatójármű-vezetők, ill. ennek megfelelő feladatot ellátó személyek esetén:
- a vonat összeállítására, a veszélyes áruk jelenlétére és azok vonaton belüli helyére vonatkozó, szükséges információkhoz való hozzáférés módja;
  - a szabálytalanságok fajtái;
  - szabálytalanságok esetén a kritikus helyzetek kezelése, intézkedések fogantatása a saját vonatuk és a szomszédos vágányokon folyó forgalom védelmére;
- az 1 kategóriába tartozó kocsirendezők, ill. ennek megfelelő feladatot ellátó személyek esetén:
- a RID 13 és 15 számú tolatási bárcájának jelentése (lásd az 5.3.4.2 bekezdést);
  - a RID 7.5.3 szakasza szerinti védőtávolságok az 1 osztály áruinál;
  - a szabálytalanságok felismerése;
- b) a 2 kategóriába tartozó kocsivizsgálók, ill. ennek megfelelő feladatot ellátó személyek esetén:
- „A teherkocsik nemzetközi forgalomban történő kölcsönös használatáról szóló szabályzat (RIV)” XII Melléklete (A teherkocsik műszaki vizsgálatának feltételei nemzetközi forgalomban) szerinti vizsgálatok végrehajtása;
  - az UIC 471-3 Döntvény normatíváinak gyakorlati alkalmazása (csak azon személyek részére, akik az 1.4.2.2.1 pontban meghatározott ellenőrzéseket végzik);
  - a szabálytalanságok fajtái;
- c) a 3 kategóriába tartozó forgalmi szolgálattevők, váltókezelők, irányítóközpontok dolgozói, ill. ennek megfelelő feladatot ellátó személyek esetén:
- szabálytalanságok esetén a kritikus helyzetek kezelése;
  - a RID 1.11 fejezete szerinti belső veszélyelhárítási terv a rendezőpályaudvarokra.

**1.3.2.3      *Biztonsági képzés***

A személyzetet ki kell oktatni a veszélyes áruk által képviselt veszélyekről és kockázatról azzal arányban, hogy a veszélyes áruk szállításakor, be- vagy kirakásakor bekövetkező baleset esetén mekkora a sérülés veszélye, illetve mennyire van kitéve a veszélyes áru hatásának.

Az oktatás célja, hogy a személy tudatában legyen a biztonságos árukezelés szabályainak és a veszélyhelyzet elhárítására teendő intézkedéseknek.

**1.3.2.4      (törölve)****1.3.3      Dokumentálás**

Az oktatásra vonatkozó iratokat a munkáltatónak és a munkavállalónak is meg kell őriznie, és új munkakör betöltése esetén ellenőrizni kell. A személyzet oktatását ismeretfelújító oktatás keretében rendszeresen ki kell egészíteni az előírásokban történt változásokkal.

## 1.4 fejezet

### A résztvevők biztonsággal kapcsolatos kötelezettségei

#### 1.4.1 Általános biztonsági előírások

**1.4.1.1** A veszélyes áru fuvarozásában résztvevőknek az előrelátható veszély természetének és mértékének megfelelő intézkedéseket kell tenniük, hogy elkerüljék a sérüléseket és károkat, ill. a lehető legkisebbre csökkentsék a következményeket. A RID előírásait azonban mindenképpen be kell tartani.

**1.4.1.2** Amennyiben olyan közvetlen veszély áll fenn, ami a közbiztonságot veszélyezteti, a résztvevőknek azonnal értesíteniük kell a vészelhárító szolgálatokat, és rendelkezésükre kell bocsátaniuk azokat az információkat, amelyeket beavatkozásukhoz igényelnek.

**1.4.1.3** A RID a különböző résztvevőkre háruló kötelezettségeket részletesebben is megadhatja.

Ha egy Tagállam véleménye szerint nem jár a biztonság csökkenésével, a valamely résztvevőre háruló kötelezettségeket belföldi jogszabályaiban átháríthatja egy vagy több másik résztvevőre, feltéve, hogy az 1.4.2 és az 1.4.3 szakaszban felsorolt kötelezettségeknek eleget tesznek. Ezekről az eltérésekről a Tagállamnak értesítenie kell az OTIF Titkárságát, amely a többi Tagállam tudomására hozza.

Az 1.2.1, az 1.4.2 és az 1.4.3 szakasznak a résztvevők és kötelezettségeik meghatározására vonatkozó előírásai nem érintik a belföldi jog jogkövetkezményekre (büntetőjogi, kártérítési felelősség stb.) vonatkozó azon előírásait, amelyek abból fakadnak, hogy a kérdéses résztvevő pl. természetes vagy jogi személy, önálló vállalkozó, munkaadó vagy alkalmazott.

#### 1.4.2 A fő résztvevők kötelezettsége

***Megjegyzés:** A radioaktív anyagokra lásd még az 1.7.6 szakaszt is.*

##### 1.4.2.1 Feladó

**1.4.2.1.1** A veszélyes áru feladója csak olyan küldeményt adhat át fuvarozásra, amely megfelel a RID előírásainak. A feladó – az 1.4.1 szakasz figyelembevételével – különösen a következő kötelezettségek hárulnak:

- a) meg kell győződnie arról, hogy a veszélyes áru a RID-del összhangban van besorolva és fuvarozása engedélyezett;
- b) el kell látnia a fuvarozót információval és adatokkal, ill. szükség esetén az előírt fuvarokmánnyal és kísérő okmányokkal (jóváhagyások, engedélyek, bejelentések, bizonyítványok stb.), különös tekintettel az 5.4 fejezet és a 3.2 fejezet „A” táblázatának előírásaira;
- c) csak olyan csomagolóeszközöket, nagycsomagolásokat, IBC-eket és tartányokat (tartálykocsikat, leszerelhető tartányos kocsikat, battériás kocsikat, MEG-konténereket, mobil tartányokat és tankkonténereket) szabad használnia, amelyek jóvá vannak hagyva és az adott anyag szállítására alkalmasak, ill. el vannak látva a RID által előírt jelölésekkel;
- d) be kell tartania a feladás módjára és a továbbítási korlátozásokra vonatkozó előírásokat;

- e) biztosítani kell, hogy még az üres, tisztítatlan és nem gáztalanított tartányok (tartálykocsik, leszerelhető tartányos kocsik, battériás kocsik, MEG-konténerek, mobil tartányok vagy tankkonténerek), illetve az ömlesztett áruhoz használt üres, tisztítatlan kocsik, nagy- és kiskonténerek is el legyenek látva megfelelő jelölésekkel és veszélyességi bárcákkal, továbbá az üres, tisztítatlan tartányok ugyanolyan tömören le legyenek zárva, mint megtöltött állapotban.

**1.4.2.1.2** Ha a feladó más résztvevők (csomagoló, berakó, töltő stb.) szolgáltatásait veszi igénybe, megfelelő intézkedéseket kell fogantatnia annak biztosítására, hogy a küldemény megfeleljen a RID előírásainak. Az 1.4.2.1.1 a), b), c) és e) pont esetében azonban a feladó megbízhat a többi résztvevőtől kapott adatokban és információkban.

**1.4.2.1.3** Ha a feladó harmadik fél nevében vagy megbízásából jár el, ez utóbbinak a feladót írásban kell tájékoztatnia arról, hogy veszélyes áruval van szó, és rendelkezésre kell bocsátania minden információt és okmányt, amire a feladónak szüksége van kötelezettségei teljesítéséhez.

#### **1.4.2.2** *Fuvarozó*

**1.4.2.2.1** A fuvarozóra, aki a feladás helyén a veszélyes árut átveszi, – az 1.4.1 szakasz figyelembevételével – reprezentatív módon, szűrőpróbaszerűen különösen a következő kötelezettségek hárulnak:

- a) meg kell győződnie arról, hogy a szállítandó veszélyes áru a RID szerint fuvarozásra engedélyezett;
- b) meg kell győződnie arról, hogy az előírt okmányok a fuvarokmányhoz csatolva legyenek és továbbításra kerüljenek;
- c) szemrevételezéssel meg kell győződnie arról, hogy sem a kocsinak, sem a rakománynak nincs nyilvánvaló hiányossága, nem szivárog, nincs rajta repedés, szükséges berendezései nem hiányoznak stb.;
- d) meg kell győződnie arról, hogy a tartálykocsi, battériás kocsi, leszerelhető tartányos kocsi, mobil tartány, tankkonténer vagy MEG-konténer időszakos vizsgálatának érvényességi ideje még nem járt le;

***Megjegyzés:** A tartányok, a battériás kocsik és a MEG-konténerek az érvényességi idejük lejártá után is szállíthatók a 4.1.6.10 bekezdés (nyomástartó tartályokból álló battériás kocsik és MEG-konténerek esetén), a 4.2.4.4 bekezdés, a 4.3.2.4.4, a 6.7.2.19.6, a 6.7.3.15.6 és a 6.7.4.14.6 pontok feltételei szerint.*

- e) ellenőriznie kell, hogy a kocsik ne legyenek túlterhelve;
- f) meg kell győződnie arról, hogy a kocsira előírt nagybárcák és jelölések el vannak helyezve.

Az előzőeket – értelemszerűen – a fuvarokmány, illetve a kísérő okmányok alapján, a kocsi vagy a konténer, vagy adott esetben a rakomány szemrevételezésével kell végrehajtani.

Ezen pont előírásai az UIC 471-3 V Döntvény<sup>7)</sup> (Veszélyes áru küldemények ellenőrzése) 5. pontja alkalmazása esetén teljesítettnek tekinthetők.

**1.4.2.2.2** Az 1.4.2.2.1 a), b), e) és f) pont esetében azonban a fuvarozó megbízhat többi résztvevőtől kapott információkban és adatokban.

7) Az UIC Döntvény 2009. január 1-jétől érvényes kiadása.

**1.4.2.2.3** Ha a fuvarozó az 1.4.2.2.1 pont alapján a RID előírásainak megsértését tapasztalja, akkor a küldeményt mindaddig nem továbbíthatja, amíg az előírások nem teljesülnek.

**1.4.2.2.4** Ha a fuvarozó a szállítás alatt olyan szabálytalanságot észlel, amely a szállítás biztonságát veszélyeztet, a küldemény továbbítását – a közlekedés és a küldemény biztonsága, illetve a közbiztonság figyelembevételével – a lehető leghamarabb meg kell szakítania.

A szállítás csak akkor folytatható, ha a küldemény megfelel az előírásoknak. Az útvonal hátralevő része szerint illetékes hatóság(ok) azonban engedélyt adhat(nak) a szállítás folytatására.

Amennyiben a szabálytalanság nem szüntethető meg, illetve a szállítás folytatására engedélyt nem adtak, az illetékes hatóságoknak a szükséges közigazgatási eszközökkel támogatniuk kell a fuvarozót. Ugyanez vonatkozik arra az esetre is, ha a fuvarozó tájékoztatja hatóságot, hogy a feladó nem közölte vele az áru veszélyességét, és a fuvarozási szerződésekre vonatkozó jogszabályok alapján az árut lerakni, megsemmisíteni vagy ártalmatlanná tenni kívánja.

**1.4.2.2.5** A fuvarozónak biztosítania kell, hogy az igénybevett vasúti infrastruktúra üzemeltetője a szállítás alatt bármikor, gyorsan és korlátlanul hozzáférhessen azokhoz az adatokhoz, melyek számára az 1.4.3.6 bekezdés b) pont előírásainak teljesítéséhez szükségesek.

***Megjegyzés:** Az adatszolgáltatás rendjét és módját az infrastruktúra használatára vonatkozó szabályzatban rögzíteni kell.*

### **1.4.2.3 Címzett**

**1.4.2.3.1** A címzett kötelezettsége az áru átvétele – kivéve, ha az átvétel megtagadására kellő indokkal rendelkezik –, ill. kirakás után ellenőrizni, hogy az őt érintő RID előírásokat betartották.

A címzettre – az 1.4.1 szakasz figyelembevételével – különösen a következő kötelezettségek hárulnak:

- a) el kell végeznie a RID által megkövetelt esetekben a kocsik és konténerek előírt tisztítását és fertőtlenítését;
- b) biztosítania kell, hogy ha már a kocsikat és konténereket teljesen kiürítették, kitisztították, ill. fertőtlenítették, ne legyenek rajtuk láthatók a nagybárcák és a narancssárga tábla jelölések.

Egy kocsi vagy konténer csak akkor adható vissza vagy használható fel ismét, ha az előzőekben említett előírásokat betartották.

**1.4.2.3.2** Ha a címzett más résztvevők (kirakók, tisztító, fertőtlenítő helyek stb.) szolgáltatásait is igénybe veszi, akkor megfelelő intézkedéseket kell foganatosítania annak biztosítására, hogy az 1.4.2.3.1 pont előírásainak megfeleljenek.

### **1.4.3 A többi résztvevő kötelezettségei**

A többi résztvevőt, ill. kötelezettségeiket a következő – nem teljes körű – felsorolás tartalmazza. A többi résztvevő kötelezettségei az előző 1.4.1 szakaszból következnek, amennyiben tudatában vannak vagy tudatában kell lenniük, hogy feladataikat a RID hatálya alá eső fuvarozási tevékenység részeként végzik.

**1.4.3.1 Berakó**

**1.4.3.1.1** A berakóra – az 1.4.1 szakasz figyelembevételével – különösen a következő kötelezettségek hárulnak:

- a) csak akkor adhatja át az árut a fuvarozónak, ha az a RID szerint fuvarozható;
- b) amikor becsomagolt veszélyes árut vagy üres, tisztítatlan csomagolóeszközt ad át szállításra, ellenőriznie kell a csomagolóeszközök sértetlenségét. Nem adhat át olyan küldeménydarabot, amelynek csomagolóeszköze sérült – különösen, ha az nem tömített, szivárog vagy fennáll a veszélyes áru kifolyásának veszélye –, amíg a sérülést ki nem javították; ugyanez vonatkozik az üres, tisztítatlan csomagolóeszközökre is;
- c) amikor veszélyes árut rak egy kocsiba vagy nagykonténerbe, be kell tartania a rakodásra és árukezelésre vonatkozó különleges előírásokat;
- d) amikor a veszélyes árut közvetlenül adja át a fuvarozónak szállítás céljából, figyelembe kell vennie a kocsi vagy nagykonténer bárcázására (nagybárcák elhelyezésére) és a kocsi vagy nagykonténer narancssárga táblával való jelölésére vonatkozó előírásokat;
- e) amikor a küldeménydarabokat berakja, be kell tartania az együvé rakásra vonatkozó tiltásokat, figyelembe véve a kocsiban vagy nagykonténerben levő, korábban berakott veszélyes árukat és az élelmiszerektől, egyéb fogyasztási cikkektől és takarmánytól való elkülönítésre vonatkozó előírásokat.

**1.4.3.1.2** Az 1.4.3.1.1. a), d) és e) pont esetében azonban a berakó megbízhat a többi résztvevőtől kapott információkban és adatokban.

**1.4.3.2 Csomagoló**

A csomagolóra - az 1.4.1 szakasz figyelembevételével - különösen a következő kötelezettségek hárulnak:

- a) be kell tartania a csomagolási és az egybecsomagolási feltételekre vonatkozó előírásokat;
- b) amikor egy küldeménydarabot szállításra előkészít, be kell tartania a küldeménydarabok jelölésére és bárcázására vonatkozó előírásokat.

**1.4.3.3 Töltő**

A töltőre – az 1.4.1 szakasz figyelembevételével – különösen a következő kötelezettségek hárulnak:

- a) a tartány megtöltése előtt meg kell győződnie arról, hogy a tartány és szerelvényei kielégítő műszaki állapotban vannak;
- b) meg kell győződnie arról, hogy a tartálykocsi, battériás kocsi, leszerelhető tartányos kocsi, mobil tartány, tankkonténer vagy MEG-konténer időszakos vizsgálatának érvényességi ideje még nem járt le;
- c) tartányba csak olyan veszélyes árut tölthet, amelynek szállítására az adott tartány engedélyezve van;
- d) a tartányok töltése során be kell tartania a szomszédos tartánykamrákban levő veszélyes árukra vonatkozó előírásokat;

- e) a töltés során be kell tartania a betöltendő anyagra engedélyezett legnagyobb töltési fokot vagy az űrtartalom literenkénti legnagyobb töltési tömeget;
- f) a tartány megtöltése után ellenőriznie kell a zárószerkezetek tömörségét;
- g) biztosítani kell, hogy az általa megtöltött tartány külsején ne maradjon a betöltött anyagból semmilyen veszélyes maradék;
- h) a veszélyes áru szállításra történő előkészítése során biztosítani kell, hogy a narancssárga táblák és veszélyességi bárcák vagy nagybárcák az előírás szerint el legyenek helyezve a tartányokon, a kocsikon és a kis- és nagykonténereken;
- i) cseppfolyósított gáz tartálykocsiba töltése előtt és után figyelembe kell vennie az ide vonatkozó különleges ellenőrzési előírásokat;
- j) meg kell győződnie arról, hogy ömlesztett áru kocsiba, ill. konténerbe rakodása során a 7.3 fejezet vonatkozó előírásait betartják.

#### **1.4.3.4 Tankkonténer vagy mobil tartány üzembentartója**

A tankkonténer vagy mobil tartány üzemben tartójára – az 1.4.1 szakasz figyelembevételével – különösen a következő kötelezettségek hárulnak:

- a) biztosítani kell, hogy a gyártásra, a szerelvényekre, a vizsgálatokra és a jelölésre vonatkozó követelményeknek megfeleljenek;
- b) biztosítani kell, hogy a tartányt és szerelvényeit oly módon tartsák karban, ami biztosítja, hogy rendes üzemeltetési körülmények között a tankkonténer vagy a mobil tartány a következő időszakos vizsgálatig kielégítse a RID előírásait;
- c) soron kívüli ellenőrzést kell végeztetnie, ha a tartány vagy szerelvényei biztonságát javítás, átalakítás vagy baleset csökkentheti.

#### **1.4.3.5 Tartálykocsi üzembentartója**

A tartálykocsi üzembentartójára – az 1.4.1 szakasz figyelembevételével – különösen a következő kötelezettségek hárulnak:

- a) biztosítani kell, hogy a gyártásra, a szerelvényekre, a vizsgálatokra és a jelölésre vonatkozó követelményeknek megfeleljenek;
- b) biztosítani kell, hogy a tartányt és szerelvényeit oly módon tartsák karban, ami biztosítja, hogy rendes üzemeltetési körülmények között a tartálykocsi a következő időszakos vizsgálatig kielégítse a RID előírásait;
- c) soron kívüli ellenőrzést kell végeztetnie, ha a tartány vagy szerelvényei biztonságát javítás, átalakítás vagy baleset csökkentheti.

#### **1.4.3.6 Vasúti infrastruktúra üzemeltetője**

Az 1.4.1 szakasz alapján a vasúti infrastruktúra üzemeltetőjére különösen a következő kötelezettségek hárulnak:

- a) gondoskodnia kell arról, hogy a rendezőpályaudvarokra az 1.11 fejezet szerinti „Belső veszélyelhárítási terv” készüljön;
- b) gondoskodnia kell arról, hogy a szállítás alatt bármikor gyorsan és korlátlanul hozzáférhessen a következő információkhoz:

- a vonat összeállítása,
- a szállított veszélyes áruk UN száma,
- ezen kocsiknak a vonatban való elhelyezkedése,
- a rakomány tömege.

Ezen az információk csak azok számára közölhetők, akiknek a biztonság, a közbiztonság vagy a vészhelyzet elhárítása érdekében ezekre szükségük van.

**Megjegyzés:** *Az adatszolgáltatás rendjét és módját az infrastruktúra használatára vonatkozó szabályzatban rögzíteni kell.*

## 1.5 fejezet

### Eltérések

#### 1.5.1 Ideiglenes eltérések

- 1.5.1.1** A Tagállamok illetékes hatóságai közvetlenül egymás között megállapodhatnak abban, hogy területeiken bizonyos fuvarozásokat ideiglenesen a RID előírásaitól eltérően engedélyeznek, feltéve, hogy ez a biztonságot nem veszélyezteti. Annak a hatóságnak, amely az ideiglenes eltérést kezdeményezte, értesítenie kell az ilyen ideiglenes eltérésekről az OTIF Titkárságát, hogy az a Tagállamok tudomására hozhassa<sup>8)</sup>.

**Megjegyzés:** Az 1.7.4 szakasz szerinti „Külön megegyezés” nem tekinthető az ezen fejezet szerinti ideiglenes eltérésnek.

- 1.5.1.2** Az ideiglenes eltérés érvényességének időtartama nem lehet öt évnél hosszabb az életbe lépésétől számítva. Az ideiglenes eltérés automatikusan megszűnik a RID megfelelő módosításának életbelépési dátumától kezdve.

- 1.5.1.3** Az ideiglenes eltérések alapján végzett fuvarozás a COTIF C Függeléke értelmében fuvarozásnak minősül.

#### 1.5.2 Katonai küldemények

A katonai küldeményekre, azaz az 1 osztály anyagait és tárgyait tartalmazó olyan küldeményekre, amelyek a fegyveres erőkhez tartoznak, vagy a fegyveres erők ellenőrzése alatt állnak, eltérő rendelkezések vonatkoznak [lásd az 5.2.1.5 bekezdést, az 5.2.2.1.8, 5.3.1.1.2 és 5.4.1.2.1 f) pontot, valamint a 7.2.4 szakasz W2 különleges előírását].

---

8) Az ezen szakasz alapján elfogadott ideiglenes eltérések az OTIF honlapján ([www.otif.org](http://www.otif.org)) megtekinthetők.

## 1.6 fejezet

### Átmeneti előírások

#### 1.6.1 Általános előírások

**1.6.1.1** A RID anyagai és tárgyai – más előírás hiányában – 2009. június 30-ig a RID 2008. december 31-ig érvényes előírásai<sup>9)</sup> szerint is fuvarozhatók.

*Megjegyzés:* A fuvarokmányba teendő bejegyzésekre lásd az 5.4.1.1.12 pontot.

**1.6.1.2** a) Azok a 7A, 7B, 7C, 7D és 7E számú veszélyességi bárcák, ill. nagybárcák, amelyek 2004. december 31-ig megfeleltek az akkor érvényes mintának, 2010. december 31-ig tovább használhatók.

b) Azok az 5.2 számú veszélyességi bárcák, ill. nagybárcák, amelyek 2006. december 31-ig megfeleltek az akkor érvényes mintának, 2010. december 31-ig tovább használhatók.

**1.6.1.3** Azok az 1 osztályba tartozó anyagok és tárgyak, amelyek valamely Tagállam fegyveres erőihez tartoznak és amelyeket 1990. január 1-je előtt a RID akkor érvényes előírásainak<sup>10)</sup> megfelelően csomagoltak, 1989. december 31-e után is fuvarozhatók, amennyiben a csomagolások sértetlenek és a fuvarokmányba tett bejegyzés szerint ezek 1990. január 1-je előtt csomagolt katonai áruk. Az erre az osztályra 1990. január 1-jétől érvényes egyéb előírásokat be kell tartani.

**1.6.1.4** Azok az 1 osztályba tartozó anyagok és tárgyak, amelyeket 1990. január 1-je és 1996. december 31-e között a RID ezen időszakban érvényes előírásainak<sup>11)</sup> megfelelően csomagoltak, 1996. december 31-e után is fuvarozhatók, amennyiben a csomagolások sértetlenek és a fuvarokmányba tett bejegyzés szerint ezek az 1 osztályba tartozó olyan áruk, amelyeket 1990. január 1-je és 1996. december 31-e között csomagoltak.

**1.6.1.5** Azok az IBC-k, amelyeket a 405 szélzetszám (5) bekezdésének és az 555 szélzetszám (3) bekezdés 1999. január 1-je előtt érvényes előírásai szerint gyártottak, de nem felelnek meg a 405 szélzetszám (5) bekezdésének és az 555 szélzetszám (3) bekezdés 1999. január 1-jétől érvényes előírásainak, továbbra is használhatók.

**1.6.1.6** Azok az IBC-k, amelyeket 2003. január 1-je előtt az 1612 szélzetszám (1) bekezdése 2001. június 30-ig érvényes előírásai szerint gyártottak, de a 6.5.2.1.1 pont szerinti betűk, számok és jelek magassága nem felel meg a 2001. július 1-től érvényes előírásoknak, továbbra is használhatók.

**1.6.1.7** Azok a típusjövahagyások, amelyeket a nagy vagy közepes molekulatömegű polietilénből gyártott hordókra, kannákra, ill. összetett csomagolóeszközökre a 6.1.5.2.6 pont 2004. december 31-ig érvényes előírásai alapján 2005. július 1-je előtt adtak ki, de nem felelnek meg a 4.1.1.19 bekezdés követelményeinek, 2009. december 31-ig érvényesek. Az e típusjövahagyások alapján gyártott és jelöléssel ellátott csomagolóeszközök a 4.1.1.15 bekezdésben meghatározott felhasználási időtartamuk leteltéig használhatók.

**1.6.1.8** Az 5.3.2.2 bekezdés 2004. december 31-ig érvényes követelményeinek megfelelő

9) A RID 2007. január 1-től érvényes kiadása.

10) A RID 1985. május 1-jétől érvényes kiadása.

11) A RID 1990. január 1-jétől, 1993. január 1-jétől és 1995. január 1-jétől érvényes kiadásai.

narancssárga jelölések továbbra is használhatók.

**1.6.1.9** (fenntartva)

**1.6.1.10** Azok a 2003. július 1-je előtt gyártott lítium-cellák, ill. akkumulátorok, amelyeket a 2002. december 31-ig érvényes előírások szerint bevizsgáltak, de a 2003. január 1-jétől érvényes előírások szerint nem vizsgáltak, valamint az ilyen lítium-cellákat, ill. akkumulátorokat tartalmazó készülékek 2013. június 30-ig szállíthatók, ha egyébként minden más előírásnak megfelelnek.

**1.6.1.11** Azok a típusjóvá hagyások, amelyeket 2007. július 1-e előtt, a 6.1.6.1 bekezdés a) pontjának 2006. december 31-ig érvényes követelményei alapján adtak ki nagy és közepes molekulatömegű polietilénből gyártott hordókra, kannákra, összetett csomagolóeszközökre, ill. nagy molekulatömegű polietilénből gyártott IBC-kre, de amelyek nem felelnek meg a 6.1.6.1 bekezdés a) pontjának 2007. január 1-től érvényes követelményeinek, továbbra is érvényesek.

**1.6.1.12** (fenntartva)

**1.6.1.13** A 2009. január 1-je előtt először nyilvántartásba vett vagy üzembe helyezett kocsiknál az 5.3.2.2.1 és az 5.3.2.2.2 pont azon követelményeit, amelyek szerint a táblának, a számoknak és a betűknek rögzítve kell maradniuk, bármilyen helyzetben van is a kocs, 2009. december 31-ig nem szükséges alkalmazni.

**1.6.1.14** Azok az IBC-k, amelyeket 2011. január 1-je előtt, a 2010. december 31-ig érvényes előírások szerint, olyan gyártási típus alapján gyártottak, amelyen nem végezték el a 6.5.6.13 bekezdés szerinti rázó vizsgálatot, továbbra is használhatók.

**1.6.1.15** A 2011. január 1-je előtt gyártott, átalakított, ill. javított IBC-ken nem szükséges feltüntetni a 6.5.2.2.2 pont szerinti legnagyobb megengedett halmazolási terhelést. Az ilyen IBC-k a 6.5.2.2.2 pont szerinti jelölés nélkül 2010. december 31-e után is használhatók, de ha ezen időpont után az IBC-t átalakítják vagy javítják, akkor el kell látni a 6.5.2.2.2 pont szerinti jelöléssel.

**1.6.1.16** A tenyészet esetén „A” kategóriába sorolandó (lásd a 2.2.62.1.12.2 pontot) kórokozók kivételével, a „B” kategóriájú kórokozóval fertőzött állati eredetű anyagok 2014. december 31-ig az illetékes hatóság által meghatározott előírások<sup>12)</sup> szerint szállíthatók.

**1.6.1.17** Az UN 3077 és az UN 3082 tétel alá soroltak kivételével az 1 – 9 osztályba tartozó anyagok, amelyek a 2.2.9.1.10 pont osztályozási kritériumai szerint nincsenek besorolva, és az 5.2.1.8 bekezdés és az 5.3.6 szakasz szerint nincsenek megjelölve, 2010. december 31-ig a környezetre veszélyes anyagok szállítására vonatkozó előírások betartása nélkül szállíthatók.

**1.6.1.18** A 3.4.9 – 3.4.13 szakaszok előírásait csak 2011. január 1-től kell alkalmazni.

**1.6.2 Nyomástartó tartályok és a 2 osztály anyagaihoz használt tartályok**

**1.6.2.1** Azok az 1997. január 1-je előtt gyártott tartályok, amelyek a RID 1997. január 1-jétől érvényes előírásainak nem felelnek meg, de amelyek fuvarozása a RID 1996. december 31-ig érvényes előírásai szerint engedélyezett volt, ezen időpont után is használhatók, amennyiben a P200 és a P203 csomagolási utasításban előírt időszakos vizsgálatok alapján megfelelnek.

12) Fertőzött állati tetemekre vonatkozó előírások találhatók pl. az Európai Parlament és a Tanács 1774/2002/EK (2002. október 3.) rendeletében a nem emberi fogyasztásra szánt állati melléktermékekre vonatkozó egészségügyi előírások megállapításáról (az EK Hivatalos Lapja L 273 szám, 2002. 10. 10., 1. oldal)

- 1.6.2.2** Azok az 1.2.1 szakaszban található meghatározás szerinti palackok, amelyeket első alkalommal vagy időszakosan 1997. január 1-je előtt vizsgáltak, következő töltésük vagy következő időszakos vizsgálatuk időpontjáig üres, tisztítatlan állapotban bárcák nélkül is fuvarozhatók.
- 1.6.2.3** A 2003. január 1-je előtt gyártott tartályok 2003. január 1-je után is viselhetik azokat a jelöléseket, amelyek a 2002. december 31-ig érvényes követelményeknek felelnek meg.
- 1.6.2.4** Továbbra is használhatók az olyan műszaki szabályzat szerint, korábban tervezett és gyártott nyomástartó tartályok, amelyet az illetékes hatóság a 6.2.5 szakasz értelmében már nem ismerhet el.
- 1.6.2.5** Továbbra is használhatók azok a nyomástartó tartályok, ill. zárószerkezeteik, amelyeket olyan, a gyártásukkor érvényes szabványok szerint terveztek és gyártottak (lásd a 6.2.4 szakaszt), amelyek a RID akkor érvényes előírásai szerint alkalmazhatók voltak.
- 1.6.2.6** Azok a nem a 2 osztályba tartozó anyagokhoz használt nyomástartó tartályok, amelyeket a 4.1.4.4 bekezdés 2008. december 31-ig érvényes előírásai szerint, 2009. július 1-je előtt gyártottak, és amelyek nem felelnek meg a 4.1.3.6 bekezdés 2009. január 1-től érvényes előírásainak, továbbra is használhatók, amennyiben a 4.1.4.4 bekezdés 2008. december 31-ig érvényes többi előírását is betartják.
- 1.6.2.7** 2011. június 30-áig a Tagállamok tovább alkalmazhatják a 6.2.1.4.1 – 6.2.1.4.4 pontok 2008. december 31-ig érvényes követelményeit az 1.8.6, 1.8.7 szakaszok és a 6.2.2.9, 6.2.3.6 – 6.2.3.8 bekezdések követelményei helyett.
- 1.6.3 Tartálykocsik és battériás kocsik**
- 1.6.3.1** Azok a tartálykocsik, amelyeket az 1978. október 1-jétől alkalmazható előírások életbe lépése előtt gyártottak, továbbra is használhatók, ha a tartány szerelvényei kielégítik a 6.8 fejezet követelményeit. A tartányok falvastagságát – a 2 osztály cseppfolyósított gázainak szállítására használt tartányok kivételével – szerkezeti acélból gyártott tartánynál legalább 0,4 MPa (4 bar) tervezési nyomásra (túlnyomásra), alumíniumból és alumíniumötvözetből gyártott tartánynál legalább 200 kPa (2 bar) tervezési nyomásra (túlnyomásra) kell méretezni.
- 1.6.3.2** Az időszakos vizsgálatokat az átmeneti előírások szerint tovább használt tartálykocsik esetén a 6.8.2.4 és a 6.8.3.4 bekezdés előírásai az egyes osztályokra vonatkozó különleges előírások szerint kell végrehajtani. Hacsak a korábbiakban nagyobb próbanyomás nem volt előírva, az alumíniumból és alumíniumötvözetből gyártott tartányoknál elegendő a 200 kPa (2 bar) próbanyomás (túlnyomás).
- 1.6.3.3** Azok a tartálykocsik, amelyek ezeknek az 1.6.3.1 és az 1.6.3.2 bekezdés átmeneti előírásainak megfelelnek, 1998. szeptember 30-ig tovább használhatók olyan veszélyes áruk fuvarozására, amelyekre eredetileg engedélyezve voltak. Ez az átmeneti időszak nem érvényes a 2 osztályba tartozó anyagok fuvarozására használt tartálykocsikra, sem az olyan tartálykocsikra, amelyeknek falvastagsága és szerelvényei megfelelnek a 6.8 fejezet előírásainak.
- 1.6.3.4** Azok a tartálykocsik, amelyeket az 1988. január 1-je előtt az 1987. december 31-ig érvényes előírások szerint gyártottak, de nem felelnek meg az 1988. január 1-jétől érvényes előírásoknak, továbbra is használhatók. Ez érvényes azokra a tartálykocsikra is, amelyek nincsenek ellátva az 1988. január 1-jétől a XI. Függelék 1.6.1 pontjában előírt jelöléssel a tartány anyagának feltüntetésére.

- 1.6.3.5** Azok a tartálykocsik, amelyeket az 1993. január 1-je előtt az 1992. december 31-ig érvényes előírások szerint gyártottak, de nem felelnek meg az 1993. január 1-jétől érvényes előírásoknak, továbbra is használhatók.
- 1.6.3.6** Azok a tartálykocsik, amelyeket az 1995. január 1-je előtt az 1994. december 31-ig érvényes előírások szerint gyártottak, de nem felelnek meg az 1995. január 1-jétől érvényes előírásoknak, továbbra is használhatók.
- 1.6.3.7** Azok az 55...60 °C közötti lobbanáspontú gyúlékony, folyékony anyagok szállítására szolgáló tartálykocsik, amelyeket az 1997. január 1-je előtt a XI. Függelék 1.2.7, 1.3.8 és 3.3.3 pontjának 1996. december 31-ig érvényes előírásai szerint gyártottak, de nem felelnek meg ezen pontok 1997. január 1-jétől érvényes előírásainak, továbbra is használhatók.
- 1.6.3.8** A 2 osztály anyagainak szállítására szolgáló, 1997. január 1-je előtt gyártott tartálykocsik, leszerelhető tartányos kocsik és battériás kocsik a következő időszakos vizsgálat időpontjáig viselhetik az 1996. december 31-ig érvényes előírások szerinti jelölést. Amikor a RID módosítása következtében egyes gázok helyes szállítási megnevezése módosul, a táblán, ill. a tartányon (lásd a 6.8.3.5.2, ill. a 6.8.3.5.3 pontot) nem szükséges a megnevezést módosítani, amennyiben a gáz(ok) megnevezését a tartálykocsin, leszerelhető tartányos kocsin, battériás kocsin vagy a rajtuk levő táblán [lásd a 6.8.3.5.6 b) és c) pontot] a következő időszakos vizsgálat során módosítják.
- 1.6.3.9** (fenntartva)
- 1.6.3.10** (fenntartva)
- 1.6.3.11** Azok a tartálykocsik, amelyeket 1997. január 1-je előtt az 1996. december 31-ig érvényes előírások szerint gyártottak, de nem felelnek meg a XI. Függelék 3.3.3 és 3.3.4 pontja 1997. január 1-jétől érvényes előírásainak, továbbra is használhatók.
- 1.6.3.12** Az UN 2401 piperidin szállítására szolgáló tartálykocsik, amelyeket a XI. Függelék 3.2.3 pontjának 1998. december 31-ig érvényes előírásai szerint gyártottak, de nem felelnek meg az 1999. január 1-jétől alkalmazható előírásoknak, 2009. december 31-ig tovább használhatók.
- 1.6.3.13** (törölve)
- 1.6.3.14** Azok a tartálykocsik, amelyeket 1999. január 1-je előtt a XI. Függelék 5.3.6.3 pontjának 1998. december 31-ig érvényes előírásai szerint gyártottak, de nem felelnek meg a XI. Függelék 5.3.6.3 pontja 1999. január 1-jétől érvényes előírásainak, továbbra is használhatók.
- 1.6.3.15** Azok a 2007. július 1-je előtt, a 2006. december 31-ig érvényes előírások szerint gyártott tartálykocsik, amelyek nem felelnek meg a 6.8.2.2.3 pont 2007. január 1-jétől érvényes előírásainak, a következő időszakos vizsgálatig tovább használhatók.
- 1.6.3.16** Azoknál a 2007. január 1-je előtt gyártott tartálykocsiknál és battériás kocsiknál, amelyek nem felelnek meg a 4.3.2 szakasz, a 6.8.2.3, a 6.8.2.4 és a 6.8.3.4 bekezdés tartány-vizsgálati könyvre (gépkönyvre) vonatkozó előírásainak, a tartány-vizsgálati könyvhöz (gépkönyvhöz) szükséges dokumentumokat legkésőbb a következő időszakos vizsgálat időpontjától kezdődően kell megőrizni.
- 1.6.3.17** Azok a 2007. július 1-je előtt, a 2006. december 31-ig érvényes előírások szerint gyártott tartálykocsik, amelyek a 3 osztály I csomagolási csoportjába tartozó, 50 °C-on legfeljebb 175 kPa (1,75 bar) gőznyomású (abszolút nyomás) anyagok szállítására szolgálnak és a 2006. december 31-ig érvényes előírások szerint L1.5BN tartánykód volt hozzájuk rendelve, az említett anyagok szállítására 2022. december 31-ig tovább használhatók.

- 1.6.3.18** Azok a tartálykocsik és battériás kocsik, amelyeket 2003. január 1-je előtt a 2001. június 30-ig érvényes előírások szerint gyártottak, azonban nem felelnek meg a 2001. július 1-jétől érvényes előírásoknak, továbbra is használhatók.
- A gyártási típus jóváhagyásban a tartánykód hozzárendelést és az ehhez tartozó jelölést 2011. január 1-jéig kell elkészíteni.
- A 6.8.4 szakasz szerinti különleges előírások TC, TE és TA betűkből és számokból álló kódjait a tartánykód hozzárendelésekor, vagy a 6.8.2.3 és a 6.8.2.4 bekezdésben előírt valamelyik következő időszakos vizsgálat alkalmával, de legkésőbb 2010. december 31-ig kell felvinni.
- 1.6.3.19** (fenntartva)
- 1.6.3.20** Azok a tartálykocsik, amelyeket 2003. július 1-je előtt, a 2002. december 31-ig érvényes előírások szerint gyártottak, és amelyek nem felelnek meg a 6.8.2.1.7 pont 2003. január 1-jétől érvényes követelményeinek és a 6.8.4 szakasz b) pont TE15 különleges előírása 2003. január 1-jétől 2006. december 31-ig érvényes követelményeinek, továbbra is használhatók.
- 1.6.3.21** Azok a 2003. január 1-je előtt, a 2001. június 30-ig érvényes előírások szerint gyártott tartálykocsik, amelyek megfelelnek a 6.8.2.2.10 pont előírásainak, de nincs rajtuk nyomásmérő- vagy más alkalmas jelzőeszköz, ennek ellenére a 6.8.2.4.2 pont szerinti következő időszakos vizsgálatig, de legfeljebb 2010. december 31-ig légmentesen zártnak tekinthetők.
- 1.6.3.22** Azok az alumíniumötvözetből készült tartálykocsik, amelyeket 2003. január 1-je előtt a 2002. december 31-ig érvényes előírások szerint gyártottak, de nem felelnek meg a 2003. január 1-jétől érvényes előírásoknak, továbbra is használhatók.
- 1.6.3.23** (törölve)
- 1.6.3.24** Az UN 1052, 1790 és 2073 számú anyagok és a maró gázok szállítására szolgáló, 2003. január 1-je előtt, a 2002. december 31-ig érvényes előírások szerint gyártott tartálykocsik, amelyek nem felelnek meg a 6.8.5.1.1 b) pont 2003. január 1-jétől érvényes előírásainak, továbbra is használhatók.
- 1.6.3.25** A 6.8.2.4.3 pontban előírt tömörségi vizsgálat időpontját a 6.8.2.5.1 pont szerinti tartánytáblán a 2005. január 1-je után végrehajtott első tömörségi vizsgálatig nem szükséges feltüntetni.
- A vizsgálat fajtáját („P”, ill. „L”) a 6.8.2.5.1 pont szerinti tartánytáblán a 2007. január 1-je után végrehajtott első vizsgálatig nem szükséges feltüntetni.
- A 6.8.2.5.2 pont által előírt „L” betűt a 2009. január 1-je után végrehajtott első vizsgálatig nem szükséges feltüntetni.
- 1.6.3.26** Azok a 2007. január 1-je előtt, a 2006. december 31-ig érvényes előírások szerint gyártott tartálykocsik, amelyek nem felelnek meg a külső tervezési nyomás feltüntetésére vonatkozóan a 6.8.2.5.1 pont 2007. január 1-től érvényes előírásainak, továbbra is használhatók.
- 1.6.3.27**
- a) Azok a 2005. január 1-je előtt gyártott tartálykocsik és battériás kocsik,
- amelyek a 2 osztályba, a T, TF, TC, TO, TFC vagy TOC betű(ke)t tartalmazó osztályozási kód alá tartozó gázok szállítására szolgálnak, valamint
  - a 3 – 8 osztály olyan anyagainak folyékony állapotban történő szállítására szolgálnak, amelyeknél a 3.2 fejezet „A” táblázat 12 oszlopában L15CH, L15DH

vagy L21DH tartánykód található,

és nem felelnek meg a 6.8.4 szakasz TE22 különleges előírása 2005. január 1-jétől érvényes követelményeinek, továbbra is használhatók. Legkésőbb 2010. december 31-ig utólagosan fel kell szerelni a TE22 különleges előírásban meghatározott szerkezeteket, ez esetben azonban elegendő, ha a legkisebb energiaelnyelő képesség a kocsi mindkét végén 500 kJ.

Azoknál a tartálykocsiknál és battériás kocsiknál, amelyeket 2011. január 1-je és 2012. december 31-e között kell a 6.8.2.4.2, ill. a 6.8.3.4.6 pont szerinti időszakos vizsgálatnak alávetni, ezt az utólagos felszerelést is elegendő 2012. december 31-ig elvégezni.

- b) Azok a 2007. január 1-je előtt gyártott tartálykocsik és battériás kocsik,
- amelyek a 2 osztályba, a csak F betűt tartalmazó osztályozási kód alá tartozó gázok szállítására szolgálnak, valamint
  - a 3 – 8 osztály osztály olyan anyagainak folyékony állapotban történő szállítására szolgálnak, amelyeknél a 3.2 fejezet „A” táblázat 12 oszlopában L10BH, L10CH vagy L10DH tartánykód található,
- és nem felelnek meg a 6.8.4 szakasz TE22 különleges előírása 2007. január 1-jétől érvényes követelményeinek, továbbra is használhatók.

**1.6.3.28** Azokat a 2005. január 1-je előtt, a 2004. december 31-ig érvényes előírások szerint gyártott tartálykocsikat, amelyek nem felelnek meg a 6.8.2.2.1 pont második bekezdése előírásainak, legkésőbb a következő felújításkor vagy javításkor kell átalakítani, ha ez gyakorlatilag lehetséges és az elvégzett munka a szerkezeti elemek megbontásával jár.

**1.6.3.29** Azok a 2005. január 1-je előtt gyártott tartálykocsik, amelyek nem felelnek meg a 6.8.2.2.4 pont 2005. január 1-jétől érvényes előírásainak, továbbra is használhatók.

**1.6.3.30** (fenntartva)

**1.6.3.31** Továbbra is használhatók azok a tartálykocsik és battériás kocsik elemeit képező tartányok, amelyeket olyan, a gyártásukkor érvényes műszaki szabályzat szerint terveztek és gyártottak, amelyet a 6.8.2.7 bekezdés akkor érvényes előírásai szerint az illetékes hatóság elismert.

**1.6.3.32** Azok a 2007. január 1-je előtt gyártott tartálykocsik,

- amelyek a 2 osztályba, a T, TF, TC, TO, TFC vagy TOC betű(ke)t tartalmazó osztályozási kód alá tartozó gázok szállítására szolgálnak, valamint
- a 3 – 8 osztály osztály olyan folyékony anyagainak szállítására szolgálnak, amelyeknél a 3.2 fejezet „A” táblázat 12 oszlopában L15CH, L15DH vagy L21DH tartánykód található,

és nem felelnek meg a 6.8.4 szakasz b) pontja szerinti TE25 különleges előírás 2007. január 1-jétől érvényes követelményeinek, továbbra is használhatók.

Az UN 1017 klór, az UN 1749 klór-trifluorid, az UN 2189 diklór-szilán, az UN 2901 bróm-klorid és az UN 3057 trifluor-acetil-klorid gáz szállítására szolgáló olyan tartálykocsikat, amelyeknél a fenék falvastagsága nem felel meg a TE25 különleges előírás b) pontjának, legkésőbb 2014. december 31-ig el kell látni a TE25 különleges előírás a), c) vagy d) szerinti szerkezettel.

**1.6.3.33** A 2 osztály gázainak szállítására szolgáló, 1986. január 1-je előtt, az 1985. december 31-ig érvényes előírások szerint gyártott tartálykocsik és battériás kocsik, amelyek nem felelnek meg az ütközők tekintetében a 6.8.3.1.6 pont előírásainak, továbbra is használhatók.

**1.6.3.34** (fenntartva)

**1.6.3.35** Az 1.8.6 és az 1.8.7 szakasz követelményeit, valamint a 6.8.4 szakasz TA4 és TT9 különleges előírását a Tagállamoknak 2011. július 1-je előtt nem szükséges alkalmazni.

**1.6.3.36 –**

**1.6.3.40** (fenntartva)

#### **1.6.4 Tankkonténerek, mobil tartányok és MEG-konténerek**

**1.6.4.1** Azok a tankkonténerek, amelyeket 1988. január 1-je előtt az 1987. december 31-ig érvényes előírások szerint gyártottak, és nem felelnek meg az 1988. január 1-jétől érvényes előírásoknak, továbbra is használhatók.

**1.6.4.2** Azok a tankkonténerek, amelyeket 1993. január 1-je előtt az 1992. december 31-ig érvényes előírások szerint gyártottak, és nem felelnek meg az 1993. január 1-jétől érvényes előírásoknak, továbbra is használhatók.

**1.6.4.3** Azok az 1995. január 1-je előtt gyártott tankkonténerek, amelyeket az 1994. december 31-ig érvényes előírásoknak megfelelően gyártottak, és nem felelnek meg az 1995. január 1-jétől érvényes előírásoknak, továbbra is használhatók.

**1.6.4.4** Azok az 55...60 °C közötti lobbanáspontú gyúlékony, folyékony anyagok szállítására szolgáló tankkonténerek, amelyeket 1997. január 1-je előtt a X. Függelék 1.2.7, 1.3.8 és 3.3.3 pontjának 1996. december 31-ig érvényes előírásai szerint gyártottak, de nem felelnek meg ezen pontok 1997. január 1-jétől érvényes előírásainak, továbbra is használhatók.

**1.6.4.5** Amikor a RID módosítása következtében egyes gázok helyes szállítási megnevezése módosul, a táblán, ill. a tartányon (lásd a 6.8.3.5.2 és a 6.8.3.5.3 pontot) nem szükséges a megnevezést módosítani, amennyiben a gáz(ok) megnevezését a tankkonténeren, a MEG-konténeren vagy a rajtuk levő táblán [lásd a 6.8.3.5.6 b) és c) pontot] a következő időszakos vizsgálat során módosítják.

**1.6.4.6** Azok a 2007. január 1-je előtt, a 2006. december 31-ig érvényes előírások szerint gyártott tankkonténerek, amelyek nem felelnek meg a külső tervezési nyomás feltüntetésére vonatkozóan a 6.8.2.5.1 pont 2007. január 1-jétől érvényes előírásainak, továbbra is használhatók.

**1.6.4.7** Azok a tankkonténerek, amelyeket 1997. január 1-je előtt az 1996. december 31-ig érvényes előírások szerint gyártottak, de nem felelnek meg a X. Függelék 3.3.3 és 3.3.4 pontja 1997. január 1-jétől érvényes előírásainak, továbbra is használhatók.

**1.6.4.8** Azok a tankkonténerek, amelyeket 1999. január 1-je előtt a X. Függelék 5.3.6.3 pontjának 1998. december 31-ig érvényes előírásai szerint gyártottak, de nem felelnek meg X. Függelék 5.3.6.3 pontjának 1999. január 1-jétől érvényes előírásainak, továbbra is használhatók.

**1.6.4.9** Továbbra is használhatók azok a tankkonténerek és MEG-konténerek, amelyeket olyan, a gyártásukkor érvényes műszaki szabályzat szerint terveztek és gyártottak, amelyet a 6.8.2.7 bekezdés akkor érvényes előírásai szerint az illetékes hatóság elismert.

**1.6.4.10** (törölve)

**1.6.4.11** (fenntartva)

**1.6.4.12** Azok a tankkonténerek és a MEG-konténerek, amelyeket 2003. január 1-je előtt a RID 2001. június 30-ig érvényes előírásainak megfelelően gyártottak, de nem felelnek meg a 2001. július 1-jétől érvényes előírásoknak, tovább tovább használhatók.

- 1.6.4.13** Azok a 2003. július 1-je előtt, a 2002. december 31-ig érvényes előírások szerint gyártott tankkonténerek, amelyek nem felelnek meg a 6.8.2.1.7 pont 2003. január 1-jétől érvényes követelményeinek és a 6.8.4 szakasz b) pont TE15 különleges előírása 2003. január 1-jétől 2006. december 31-ig érvényes követelményeinek, továbbra is használhatók.
- 1.6.4.14** Az UN 1052, 1790 és 2073 számú anyagok és a maró gázok szállítására szolgáló, 2003. január 1-je előtt, a 2002. december 31-ig érvényes előírások szerint gyártott tankkonténerek, amelyek nem felelnek meg a 6.8.5.1.1 b) pont 2003. január 1-jétől érvényes előírásainak, továbbra is használhatók.
- 1.6.4.15** A vizsgálat fajtáját („P”, ill. „L”) a 6.8.2.5.1 pont szerinti tartánytáblán a 2007. január 1-je után végrehajtott első vizsgálatig nem szükséges feltüntetni.
- 1.6.4.16** (törölve)
- 1.6.4.17** Azok a 2007. július 1-je előtt, a 2006. december 31-ig érvényes előírások szerint gyártott tankkonténerek, amelyek nem felelnek meg a 6.8.2.2.3 pont 2007. január 1-jétől érvényes előírásainak, a következő időszakos vizsgálatig tovább használhatók.
- 1.6.4.18** Azoknál a 2007. január 1-je előtt gyártott tankkonténereknél és MEG-konténereknél, amelyek nem felelnek meg a 4.3.2 szakasz, a 6.8.2.3, a 6.8.2.4 és a 6.8.3.4 bekezdés tartány-vizsgálati könyvre (gépkönyvre) vonatkozó előírásainak, a tartány-vizsgálati könyvhöz (gépkönyvhöz) szükséges dokumentumokat legkésőbb a következő időszakos vizsgálat időpontjától kezdődően kell megőrizni.
- 1.6.4.19** Azok a 2007. július 1-je előtt, a 2006. december 31-ig érvényes előírások szerint gyártott tankkonténerek, amelyek a 3 osztály I csomagolási csoportjába tartozó, 50 °C-on legfeljebb 175 kPa (1,75 bar) gőznyomású (abszolút nyomás) anyagok szállítására szolgálnak és a 2006. december 31-ig érvényes előírások szerint L1.5BN tartánykód volt hozzájuk rendelve, az említett anyagok szállítására 2016. december 31-ig tovább használhatók.
- 1.6.4.20** Azok a 2005. január 1-je előtt, a 2004. december 31-ig érvényes előírások szerint gyártott, hulladékok szállítására szolgáló, vákuummal üzemelő tankkonténerek, amelyek nem felelnek meg a 6.10.3.9 bekezdés 2005. január 1-jétől érvényes előírásainak, továbbra is használhatók.
- 1.6.4.21 –**  
**1.6.4.29** (fenntartva)
- 1.6.4.30** A 2007. január 1-től érvényes tervezési előírásoknak nem megfelelő, de 2008. január 1-je előtt kiadott gyártási típus bizonyítvány szerint gyártott mobil tartányok, ill. UN MEG-konténerek továbbra is használhatók.
- 1.6.4.31** Azokhoz az anyagokhoz, amelyekhez a 3.2 fejezet „A” táblázat 11 oszlopában TP35 különleges előírás van hozzárendelve, a 2008. december 31-ig érvényes RID-ben előírt T14 mobil tartány utasítás 2014. december 31-ig tovább alkalmazható.
- 1.6.4.32** Ha egy tankkonténer tartánya már 2009. január 1-je előtt válaszfalakkal vagy hullámtörő lemezekkel legfeljebb 7500 liter űrtartalmú rekeszekre volt osztva, a 6.8.2.5.1 pont által előírt adatok között az űrtartalom adatát nem kell kiegészíteni az „S” jellel mindaddig, amíg a 6.8.2.4.2 pont szerinti, következő időszakos vizsgálatot el nem végzik.
- 1.6.4.33** Azoknál a cseppfolyósított, ill. mélyhűtött, cseppfolyósított gázok szállítására szolgáló tankkonténereknél, amelyek megfelelnek a RID gyártási követelményeinek, de amelyeket 2009. július 1-je előtt válaszfalakkal vagy hullámtörő lemezekkel 7500 liternél nagyobb

űrtartalmú rekeszekre osztottak, a töltési fok – a 4.3.2.2.4 pont előírásától eltérően – a befogadóképesség 20%-ánál nagyobb és 80%-ánál kisebb is lehet.

**1.6.4.34** Az 1.8.6 és az 1.8.7 szakasz követelményeit, valamint a 6.8.4 szakasz TA4 és TT9 különleges előírását a Tagállamoknak 2011. július 1-je előtt nem szükséges alkalmazni.

**1.6.5** (fenntartva)

**1.6.6** **7 osztály**

**1.6.6.1** *Küldeménydarabok, amelyekhez a Nemzetközi Atomenergia Ügynökség 6. sz. Biztonsági sorozat 1985. évi és 1985. évi (1990-ben) módosított kiadása szerint nem szükséges a küldeménydarab-minta illetékes hatóság általi engedélyezése*

Azok az engedményes küldeménydarabok, IP-1, IP-2 és IP-3 típusú ipari küldeménydarabok és A típusú küldeménydarabok, amelyekhez nem volt szükséges a küldeménydarab-minta illetékes hatóság általi engedélyezése és kielégítik a Nemzetközi Atomenergia Ügynökség „Előírások a radioaktív anyagok biztonságos szállítására” (NAÜ 6. sz. Biztonsági sorozat) 1985. évi vagy 1985. évi (1990-ben) módosított kiadásának követelményeit, továbbra is használhatók, azzal a kikötéssel, hogy az 1.7.3 szakasz szerinti kötelező minőségbiztosítási programra, ill. a 2.2.7.2.2, 2.2.7.2.4.1, 2.2.7.2.4.4, 2.2.7.2.4.5, 2.2.7.2.4.6 pontban, a 3.3 fejezet 336 különleges előírásában és a 4.1.9.3 bekezdésben az aktivitási határértékekre és anyagkorlátozásra vonatkozó előírásokat be kell tartani.

A 2003. december 31-e után gyártott vagy átalakított csomagolóeszközöknek (kivéve hogyha az átalakítás a biztonságot növeli) meg kell felelniük az érvényben lévő RID előírásoknak. A Nemzetközi Atomenergia Ügynökség „Előírások a radioaktív anyagok biztonságos szállítására” (NAÜ 6. sz. Biztonsági sorozat) 1985. évi vagy 1985. évi (1990-ben) módosított kiadása szerint legkésőbb 2003. december 31-ig szállításra előkészített küldeménydarabok továbbra is szállíthatók. Az ezen időpont után szállításra előkészített küldeménydaraboknak meg kell felelniük az érvényben lévő RID előírásoknak.

**1.6.6.2** *Küldeménydarabok, amelyeket a Nemzetközi Atomenergia Ügynökség 6. sz. Biztonsági sorozat 1973. évi, 1973. évi módosított, 1985. évi és 1985. évi (1990-ben) módosított kiadásának előírásai szerint engedélyeztek*

**1.6.6.2.1** A Nemzetközi Atomenergia Ügynökség 6. sz. Biztonsági sorozat 1973. évi vagy 1973. évi módosított kiadásának előírásai szerint az illetékes hatóság által engedélyezett küldeménydarab mintának megfelelően gyártott csomagolóeszközök továbbra is használhatók azzal a kikötéssel, hogy a küldeménydarab minta többoldali engedélyezése szükséges, valamint az 1.7.3 szakaszban a kötelező minőségbiztosítási programra, ill. a 2.2.7.2.2, 2.2.7.2.4.1, 2.2.7.2.4.4, 2.2.7.2.4.5, 2.2.7.2.4.6 pontban, a 3.3 fejezet 337 különleges előírásában és a 4.1.9.3 bekezdésben az aktivitási határértékekre és anyagkorlátozásra vonatkozó előírásokat be kell tartani. Új gyártás beindítása nem engedélyezhető. A csomagolóeszköz minta vagy az engedélyezett radioaktív tartalom fajtájának vagy mennyiségének olyan változtatása, amely az illetékes hatóság szerint a biztonságot lényegesen befolyásolná, meg kell feleljen az érvényben lévő RID előírásainak. Minden egyes csomagolóeszközhöz az 5.2.1.7.5 pont szerinti sorozatszámot hozzá kell rendelni és a csomagolóeszköz külsején fel kell tüntetni.

**1.6.6.2.2** A Nemzetközi Atomenergia Ügynökség 6. sz. Biztonsági sorozat 1985. évi vagy 1985. évi (1990-ben) módosított kiadásának előírásai szerint az illetékes hatóság által engedélyezett küldeménydarab-mintának megfelelően gyártott csomagolóeszközök tovább használhatók,

azzal a kikötéssel, hogy a küldeménydarab-minta többoldalú engedélyezése szükséges, valamint az 1.7.3 szakaszban a kötelező minőségbiztosítási programra, ill. a 2.2.7.2.2, 2.2.7.2.4.1, 2.2.7.2.4.4, 2.2.7.2.4.5, 2.2.7.2.4.6 pontban, a 3.3 fejezet 337 különleges előírásában és a 4.1.9.3 bekezdésben az aktivitási határértékekre és anyag korlátozásra vonatkozó előírásokat be kell tartani. A csomagolóeszköz minta vagy az engedélyezett radioaktív tartalom fajtájának vagy mennyiségének olyan változtatása, amely az illetékes hatóság szerint a biztonságot lényegesen befolyásolná, meg kell feleljen az érvényben lévő ADR előírásainak. Minden csomagolóeszköznek, amelynek gyártása 2006. december 31-e után kezdődik, meg kell felelnie az érvényben lévő RID előírásoknak.

#### 1.6.6.3

***Különleges formájú radioaktív anyagok, amelyeket a Nemzetközi Atomenergia Ügynökség 6. sz. Biztonsági sorozat 1973. évi, 1973. évi módosított, 1985. évi vagy 1985. évi (1990-ben) módosított kiadásának előírásai szerint engedélyeztek***

Az olyan minta szerint gyártott különleges formájú radioaktív anyag, amelyre az illetékes hatóság a Nemzetközi Atomenergia Ügynökség 6. sz. Biztonsági sorozat 1973. évi, 1973. évi módosított, 1985. évi vagy 1985. évi (1990-ben) módosított kiadásának előírásai szerint adott ki egyoldalú engedélyt, tovább használható, ha az megfelel az 1.7.3 szakasz vonatkozó előírásai szerinti kötelező minőségbiztosítási programnak. Minden különleges formájú radioaktív anyagnak, amelyet 2003. december 31-e után gyártanak, meg kell felelnie az érvényben lévő RID előírásoknak.

## 1.7 fejezet

### Általános előírások a 7 osztályra

#### 1.7.1 Hatály és alkalmazási terület

**Megjegyzés:** 1. A radioaktív anyagok szállítása során bekövetkező baleset vagy rendkívüli esemény esetén az emberek, az anyagi javak és a környezet védelme érdekében az illetékes nemzeti, ill. nemzetközi hatóságok által megállapított veszélyhelyzeti előírásokat kell betartani. Az ilyen előírásokhoz útmutatás található a „Planning and Preparing for Emergency Response to Transport Accidents Involving Radioactive Material”, Safety Standard Series No. TS-G-1.2 (ST-3), IAEA, Vienna (2002) kiadványban.

2. A veszélyhelyzeti beavatkozásnál figyelembe kell venni, hogy a baleset során a küldemény tartalma és a környezet között bekövetkező reakció folytán egyéb veszélyes anyagok is képződhetnek.

**1.7.1.1** A RID olyan szabályokat állapít meg, amelyek által a radioaktív anyagok szállításával kapcsolatos sugárzásból, kritikusságból vagy hőhatásból eredően a személyeket, javakat vagy környezetet érő veszélyek megfelelően kezelhetők. Ezek a szabályok az Nemzetközi Atomenergia Ügynökség „Előírások a radioaktív anyagok biztonságos szállítására”, 2005. évi kiadás, Biztonsági Szabványok Sorozat, TS-R-1 kiadványon alapulnak (Bécs, 2005.). A TS-R-1 1996-os kiadásához magyarázatok találhatók az IAEA „Advisory Material for the IAEA Regulations for the Safe Transport of Radioactive Materials”, Safety Standard Series No. TS-G-1.1 (ST-2), IAEA, Vienna, (2002) kiadványban.

**1.7.1.2** A RID célja a személyek, a javak és a környezet védelme a sugárzás hatásaival szemben a radioaktív anyagok szállítása során. Ez a védelem azáltal érhető el, hogy követelményeket támaszt:

- a) a radioaktív tartalom megtartására;
- b) a külső sugárzási szint korlátozására;
- c) a kritikusság megelőzésére; és
- d) a hőhatás okozta károk megelőzésére.

Ezek a követelmények elsősorban azáltal teljesülnek, hogy a kocsik és a küldeménydarabok tartalmának határértékei, ill. a küldeménydarab minták minőségi követelményei a radioaktív tartalom veszélyességének függvényében különböző fokozatokra vannak meghatározva. Másodsorban a küldeménydarabokra, kezelésükre, a csomagolóeszköz karbantartására vonatkozó, a radioaktív tartalom fajtáját figyelembe vevő követelmények meghatározásával és végül az adminisztratív ellenőrzések előírásával, – vagy ahol szükséges – az illetékes hatóság általi jóváhagyás megkövetelésével.

**1.7.1.3** A RID előírásait a radioaktív anyagok vasúti szállítására (fuvarozására) kell alkalmazni, beleértve a radioaktív anyagok használatával együtt járó szállításokat is. A „szállítás” magában foglalja a radioaktív anyag mozgatásával kapcsolatos minden tevékenységet, a csomagolóeszköz tervezését, gyártását, karbantartását és javítását, a radioaktív rakomány előkészítését, feladását, berakását, szállítását (beleértve a közbenső tárolását), kirakását és átvételét a rendeltetési helyen. A RID által a minőségi követelmények meghatározásánál alkalmazott különböző fokozatok három súlyossági szinttel jellemezhetők:

- a) szokásos szállítási körülmények (rendkívüli esemény nélkül);

- b) kisebb balesetek fellépése során fennálló szállítási körülmények;
- c) a szállítás során bekövetkező baleseti körülmények.

**1.7.1.4**

A RID előírásait nem kell alkalmazni, ha a szállított anyagok (tárgyak) a következők:

- a) a szállítóeszköz szerves részét képező radioaktív anyagok;
- b) valamely létesítményen belül mozgatott radioaktív anyagok, amelyek a létesítményben érvényben levő, megfelelő biztonsági előírások hatálya alá esnek, és ez a mozgatás nem vesz igénybe közutat vagy vasutat;
- c) a személyekbe vagy élő állatokba diagnosztikai vagy kezelési célra bevitt vagy beültetett radioaktív anyagok;
- d) a fogyasztási cikkekben levő, hatóságilag engedélyezett radioaktív anyagok, azok végső felhasználónak történt eladását követően;
- e) a természetben előforduló radionuklidokat tartalmazó természetes anyagok és ércek, amelyek vagy természetes állapotukban vannak, vagy a radionuklidok kinyerésén kívüli egyéb célból vannak feldolgozva, és amelyeket nem szándékoznak feldolgozni a radionuklidok felhasználása céljából, amennyiben az anyag aktivitás koncentrációja nem nagyobb, mint a 2.2.7.2.2.1 b) pontban meghatározott vagy a 2.2.7.2.2.2 – 2.2.7.2.2.6 pont szerint számított érték 10-szerese;
- f) nem radioaktív szilárd tárgyak, amelyek felületükön sehol nem tartalmaznak a 2.2.7.1.2 pontban a „szennyezettség” meghatározásánál megadott határoknál nagyobb mennyiségben radioaktív anyagokat.

**1.7.1.5*****Az engedményes küldeménydarabok szállítására vonatkozó különleges előírások***

A 2.2.7.2.4.1 pont szerinti engedményes küldeménydarabokra az 5 – 7. részek előírásai közül csak a következőket kell betartani:

- a) az 5.1.2 szakaszban, az 5.1.3.2 bekezdésben, az 5.1.4 szakaszban, az 5.2.1.2 bekezdésben, az 5.2.1.7.1 – 5.2.1.7.3 pontokban, az 5.2.1.9 bekezdésben, az 5.4.1.1.1 pont a), g) és h) alpontjában és a 7.5.11 szakasz CW33 előírás 5.2) pontjában meghatározott követelményeket;
- b) a 6.4.4 szakaszban az engedményes küldeménydarabokra meghatározott követelményeket;
- c) ha az engedményes küldeménydarab hasadóanyagot tartalmaz, akkor a 2.2.7.2.3.5 pontban szereplő, hasadóanyag mentesítési feltételek egyikének meg kell felelnie és a 6.4.7.2 bekezdés előírásait be kell tartani.

A RID összes többi részének vonatkozó előírását az engedményes küldeménydarabokra be kell tartani.

**1.7.2****Sugárvédelmi program****1.7.2.1**

A radioaktív anyagok fuvarozásához sugárvédelmi program szükséges, amely a sugárvédelmi követelmények kellő figyelembevételét célzó intézkedéseket tartalmaz.

**1.7.2.2**

A személyek sugárterhelése nem haladhatja meg az erre meghatározott dóziskorlátokat. A védelmet és biztonságot optimálni kell annak érdekében, hogy az egyéni dózisok nagysága, a sugárzásnak kitett személyek száma és a sugárterhelés valószínűsége az ésszerűen elérhető

legalacsonyabb szinten maradjon. Az optimalizáláskor tekintettel kell lenni a gazdasági és társadalmi tényezőkre, azzal, hogy az egyéni dózisok megállapításánál figyelembe kell venni a dózismegszorításokat. Rendszerszemléletű megközelítést kell alkalmazni, amely figyelembe veszi a szállítás és az egyéb tevékenységek kapcsolatát.

**1.7.2.3** A programban alkalmazott intézkedések jellegét és mértékét a sugárterhelés nagyságához és valószínűségéhez kell igazítani. A programnak tartalmaznia kell az 1.7.2.2, az 1.7.2.4 és az 1.7.2.5 bekezdés követelményeit. A program dokumentumait ellenőrzés céljából, kérésre az illetékes hatóság rendelkezésére kell bocsátani.

**1.7.2.4** Amennyiben a szállítási tevékenység során a foglalkozási sugárterhelésből eredő effektív dózis:

- a) valószínűleg évi 1 és 6 mSv között van, akkor a munkahely sugárellenőrzésén vagy az egyéni sugárterhelés ellenőrzésén alapuló dózis értékelési programot kell működtetni;
- b) valószínűleg meghaladja az évi 6 mSv-et, akkor egyéni sugárterhelési ellenőrzést kell végezni.

Az egyéni sugárterhelési ellenőrzések, ill. a munkahely sugárellenőrzésének adatairól megfelelő nyilvántartást kell vezetni.

**Megjegyzés:** Amennyiben a szállítási tevékenység során a foglalkozási sugárterhelésből eredő effektív dózis nagy valószínűséggel nem haladja meg az évi 1 mSv-et, akkor nincs szükség sem különleges munkarendre, sem részletes megfigyelésre, sem dózisértékelési programra, ill. egyéni nyilvántartás vezetésére.

**1.7.2.5** A dolgozókat (lásd a 7.5.11 szakasz CW33 előírása 3. megjegyzését) megfelelő sugárvédelmi képzésben kell részesíteni, amely kiterjed az őket érő foglalkozási sugárterhelés, ill. a tevékenységük folytán esetleg másokat érő sugárterhelés korlátozása érdekében betartandó óvintézkedésekre.

### **1.7.3 Minőségbiztosítás**

A RID előírásainak való megfelelés biztosítása érdekében a különleges formájú radioaktív anyagok, a kis mértékben diszpergálódó radioaktív anyagok és a küldeménydarabok tervezésére, gyártására, vizsgálatára, dokumentációjára, használatára, karbantartására, felügyeletére, valamint a szállításra és a szállítás közbeni átmeneti tárolásra az illetékes hatóság által elfogadott, nemzetközi, nemzeti vagy egyéb szabványokon alapuló minőségbiztosítási programot kell kialakítani és működtetni. Annak a tanúsítványnak, hogy a gyártási mintára vonatkozó követelményeket teljes mértékben teljesítették, az illetékes hatóság rendelkezésére kell állnia. A gyártónak, a feladónak és a felhasználónak – kérésre – az illetékes hatóság számára rendelkezésre kell bocsátania a gyártás vagy a használat ellenőrzéséhez szükséges berendezéseket és minden illetékes hatóság számára bizonyítani kell, hogy

- a) az alkalmazott gyártási eljárások és a használt anyagok összhangban vannak az engedélyezett mintadarab specifikációival; és
- b) minden csomagolóeszközt rendszeresen megvizsgálják és – szükség esetén – oly módon állítanak helyre és tartanak jó állapotban, hogy azok az ismételt felhasználás után is megfelelnek a vonatkozó előírásoknak és specifikációknak.

Amennyiben az illetékes hatóság engedélye szükséges, ezen engedély kiadása a minőségbiztosítási program alkalmasságának függvénye.

#### 1.7.4 Külön megegyezés

**1.7.4.1** A külön megegyezés az illetékes hatóság által jóváhagyott előírásokat jelenti, amelyek betartásával a RID radioaktív anyagokra vonatkozó követelményeinek nem mindenben megfelelő küldemény szállítható.

***Megjegyzés:** A külön megegyezés nem tekinthető az 1.5.1 szakasz szerinti ideiglenes eltérésnek.*

**1.7.4.2** Azok a küldemények, amelyeknél a 7 osztályra vonatkozó valamely előírást nem lehet betartani, csak külön megegyezés alapján fuvarozhatók. Az illetékes hatóság akkor engedélyezheti egy küldemény vagy egy előre tervezett küldemény sorozat külön megegyezés alapján történő fuvarozását, ha megbizonyosodott arról, hogy a RID előírásait valóban nem lehet betartani és a RID által megkövetelt biztonsági szintet más eszközökkel el lehet érni. A teljes szállítási biztonságnak legalább olyan szintűnek kell lennie, mintha minden vonatkozó előírást betartottak volna. Az ilyen típusú nemzetközi küldeményekhez többoldalú engedélyre van szükség.

#### 1.7.5 Egyéb veszélyes tulajdonságokkal bíró radioaktív anyag

A radioaktív és hasadó tulajdonságokon kívül a küldeménydarab tartalmának minden járulékos veszélyét, így a robbanásveszélyt, gyúlékonyságot, piroforosságot, vegyi mérgezőképességet és maró hatást ugyancsak figyelembe kell venni az okmányokban, a csomagolásnál, a bárcázásnál, a feliratozásnál, a nagybárcák elhelyezésnél, az átmeneti tárolásnál, az elkülönítésnél és a szállításnál, hogy a RID veszélyes árukra vonatkozó minden előírása teljesüljön.

#### 1.7.6 Hiányosságok

**1.7.6.1** A RID-ben előírt, a sugárzási szintre, ill. a szennyezettségre vonatkozó határértékek túllépése esetén:

- a) erről a hiányosságról értesítenie kell a feladót
  - i) a fuvarozónak, ha ezt a szállítás alatt észleli; ill.
  - ii) a címzettnek, ha átvételkor észleli;
- b) a fuvarozónak, a feladónak, ill. a címzettnek:
  - i) azonnal intézkednie kell az ebből eredő következmények elhárítására;
  - ii) ki kell vizsgálnia az okokat, körülményeket és következményeket;
  - iii) megfelelő intézkedéseket kell tennie azoknak az okoknak és körülményeknek a kiküszöbölésére, amelyek ehhez a hiányossághoz vezettek, és meg kell akadályoznia a hasonló körülmények ismételt előfordulását; és
  - iv) az illetékes hatóság(ka)t tájékoztatnia kell a hiányosság okairól és a végrehajtott vagy végrehajtandó elhárító, ill. megelőző tevékenységről; és
- c) a hiányosságról a feladót, ill. az illetékes hatóság(ka)t lehetőleg minél hamarabb kell tájékoztatni, de ha besugárzás szempontjából veszélyhelyzet alakult ki vagy van kialakulóban, azonnal tájékoztatni kell őket.

## **1.8 fejezet**

### **Biztonsági követelmények betartását biztosító ellenőrzések, ill. a biztonságot elősegítő egyéb intézkedések**

#### **1.8.1 A veszélyes áruk hatósági ellenőrzése**

##### **1.8.1.1** A Tagállamok illetékes hatóságai illetékességi területükön bármikor ellenőrizhetik, hogy a veszélyes áru szállítással kapcsolatos előírásokat, beleértve a közbiztonsági intézkedésekre vonatkozókat is az 1.10.1.5 bekezdés szerint, betartják-e.

Az ellenőrzést azonban úgy kell végezni, hogy az ne veszélyeztessen sem személyeket, sem javakat, sem a környezetet, ill. ne zavarja jelentősen a vasúti forgalmat.

##### **1.8.1.2** A veszélyes áruk fuvarozásában résztvevőknek (lásd 1.4 fejezet) az ellenőrzéshez szükséges minden, saját feladataikra vonatkozó információt haladéktalanul az illetékes hatóság vagy képviselője rendelkezésére kell bocsátaniuk.

##### **1.8.1.3** A veszélyes áruk fuvarozásában résztvevő vállalkozások (lásd 1.4 fejezet) telephelyén történő ellenőrzés céljából az illetékes hatóságok helyszíni vizsgálatot is tarthatnak, megnézhetik a szükséges okmányokat, a veszélyes áruból, ill. a csomagolóeszközből vizsgálat céljából mintát vehetnek, feltéve, hogy mindezzel nem veszélyeztetik a biztonságot. A veszélyes áruk fuvarozásában résztvevőknek (lásd 1.4 fejezet) ellenőrzés céljára a kocsikat, a kocsik alkatrészeit, a felszereléseket és a berendezéseket is hozzáférhetővé kell tenni, amennyiben az lehetséges, ill. ésszerű. Amennyiben a hatóság szükségesnek ítéli, kijelölhet valakit a vállalkozástól, hogy elkísérje az illetékes hatóság képviselőjét.

##### **1.8.1.4** Amennyiben az illetékes hatóságok azt tapasztalják, hogy a RID előírásait nem tartották be, megtilthatják a küldemény feladását vagy megszakíthatják a fuvarozást, amíg a tapasztalt hiányosságokat ki nem küszöbölik, ill. más, megfelelő intézkedést is hozhatnak. A feltartóztatás történhet a helyszínen vagy biztonsági okokból a hatóságok által kiválasztott más helyen. Ezek az intézkedések azonban nem zavarhatják jelentősen a vasúti közlekedést.

#### **1.8.2 Hivatali együttműködés**

##### **1.8.2.1** A Tagállamok hivatalainak együtt kell működniük a RID végrehajtásában.

##### **1.8.2.2** Ha egy Tagállam területén a veszélyes áruk szállításának biztonságát egy olyan vállalkozás nagyon súlyos vagy ismételt szabálytalansága veszélyezteti, amelynek székhelye egy másik Tagállam területén van, az ilyen szabálytalanságról értesítenie kell a másik Tagállam illetékes hatóságát. Azon Tagállam illetékes hatóságai, amelynek területén a súlyos vagy ismételt szabálytalanságot megállapították, felkérhetik azon Tagállam illetékes hatóságát, amelyben a vállalkozás székhelye van, hogy hozzanak megfelelő intézkedéseket a szabálytalanság elkövetője vagy elkövetői ellen. A személyekre vonatkozó adatok nem adhatók át, hacsak nem súlyos vagy ismételt szabálytalanság miatti büntetőeljáráshoz van rá szükség.

##### **1.8.2.3** Az értesített illetékes hatóságoknak a vállalkozással szemben hozott intézkedéseikről – ha ilyenre szükség volt – értesíteniük kell azon Tagállam illetékes hatóságait, amelyben a szabálytalanságot megállapították.

**1.8.3 Biztonsági tanácsadó**

**1.8.3.1** Minden vállalkozásnak, amely veszélyes árut vasúton szállít, fuvaroz vagy ahhoz kapcsolódó csomagolást, berakást, töltést vagy kirakást végez, egy vagy több veszélyes áru szállítási biztonsági tanácsadót kell kineveznie, aki azért felelős, hogy segítse megelőzni, hogy e tevékenységek veszélyeztessék az embereket, az anyagi javakat vagy a környezetet.

**1.8.3.2** A Tagállamok illetékes hatóságai rendelkezhetnek úgy, hogy ezeket a követelményeket nem kell alkalmazni azon vállalkozások esetében:

- a) amelyek szóban forgó tevékenysége a veszélyes áruk szállítása terén olyan szállítóeszközökre terjed ki, amelyek a véderők tulajdonát képezik vagy a véderők felelősségi körébe tartoznak; vagy
- b) amelyek tevékenysége olyan mennyiségekre terjed ki, melyek szállítóegységenként nem haladják meg az 1.1.3.6 és az 1.7.1.4 bekezdésben, valamint a 3.3, 3.4 és 3.5 fejezetben meghatározott értékeket; vagy
- c) amelyek fő vagy kiegészítő tevékenységi körébe nem tartozik a veszélyes áru szállítás, ill. az ezzel kapcsolatos be- és kirakás, de esetenként részt vesznek olyan veszélyes áruk belföldi szállításában vagy az ehhez kapcsolódó be- és kirakásában, amelyek csak kisebb veszélyt vagy környezeti kockázatot jelentenek.

**1.8.3.3** A tanácsadó fő feladata, hogy a vállalkozás vezetőjének felelőssége mellett minden lehetséges módon és ténykedéssel elősegítse, hogy a vállalkozás az érintett tevékenységét a hatályos szabályoknak megfelelően és a lehető legbiztonságosabb módon végezze.

A tanácsadónak a vállalkozás tevékenységére vonatkozóan a következők a feladatai:

- annak figyelemmel kísérése, hogy betartják-e a veszélyes áruk szállítását szabályozó előírásokat;
- tanácsadás a vállalkozás számára a veszélyes áruk szállítását illetően;
- éves jelentés készítése a vállalkozás vezetősége, vagy adott esetben a helyi hatóság számára a vállalkozás veszélyes áruk szállításával kapcsolatos tevékenységéről. Az éves jelentéseket öt évig meg kell őrizni, és a hatóság kérésére be kell mutatni.

A tanácsadónak ezen kívül kötelessége figyelemmel kísérni a vállalkozás érintett tevékenységére vonatkozóan a következők gyakorlati végrehajtását és az ezzel kapcsolatos eljárásokat:

- a szállítandó veszélyes áruk azonosítására vonatkozó szabályok betartását;
- azt, hogy a vállalkozás figyelembe veszi-e a szállítóeszközök vásárlásánál a szállítandó veszélyes áruval kapcsolatos különleges követelményeket;
- a veszélyes áruk szállítására, be- és kirakására használt felszerelések ellenőrzésére szolgáló eljárásokat;
- a vállalkozás alkalmazottainak megfelelő képzését, és a képzésről szóló jelentések, okmányok őrzését, nyilvántartását;
- a szállítás vagy a be- és kirakás biztonságát veszélyeztető baleset vagy rendkívüli esemény esetén a megfelelő veszélyelhárítási eljárások alkalmazását;
- a szállítás vagy a be- és kirakás alatt észlelt súlyos balesetek, rendkívüli események vagy súlyos szabálytalanságok okának felderítését, vagy amennyiben szükséges, jelentés készítését;

- a balesetek, rendkívüli események vagy súlyos szabálytalanságok ismétlődésének megakadályozását célzó megfelelő eljárások alkalmazását;
- az alvállalkozók vagy harmadik felek kiválasztásakor és igénybevételekor a veszélyes áruk fuvarozásával kapcsolatos jogi előírások és különleges követelmények figyelembevételét;
- annak ellenőrzését, hogy a veszélyes áruk szállításában, be- és kirakásában résztvevő alkalmazottak részletes technológiai utasítást és oktatást kapnak;
- a veszélyes áruk szállításakor, be- és kirakásakor fennálló veszélyek tudatosítását szolgáló intézkedések meghozatalát;
- olyan ellenőrzési eljárások fogantatását, melyek azt hivatottak biztosítani, hogy a járműveken a kötelező okmányok és biztonsági felszerelések a szabályoknak megfelelő formában megtalálhatók;
- olyan ellenőrzési eljárások fogantatását, melyek a be- és kirakással kapcsolatos szabályok betartását biztosítják;
- az 1.10.3.2 bekezdésben meghatározott közbiztonsági terv meglétét.

**1.8.3.4** A tanácsadó lehet a vállalkozás vezetője is, a vállalkozásban más feladatkört is ellátó személy vagy a vállalkozás közvetlen alkalmazásában nem álló személy, amennyiben alkalmas a tanácsadó feladatainak ellátására.

**1.8.3.5** Minden érintett vállalkozásnak az illetékes hatóság vagy az egyes Tagállamok által e célra kijelölt testület kérésére közölnie kell, hogy ki a tanácsadója.

**1.8.3.6** Ha egy szállítás, ill. az áruk be- vagy kirakása közben bekövetkezett baleset személyeket, anyagi javakat vagy a környezetet érinti, vagy bennük kárt okoz, az érintett vállalkozás tanácsadójának a lényeges információk összegyűjtése után baleseti jelentést kell készítenie a vállalkozás vezetősége vagy adott esetben a helyi hatóság részére. Ez a jelentés azonban nem helyettesíti a vállalkozás vezetésének jelentését, amely bármilyen más nemzetközi vagy belföldi szabályozás alapján szükséges.

**1.8.3.7** A tanácsadónak a vasúti szállításra érvényes bizonyítvánnyal kell rendelkeznie. A bizonyítványt az illetékes hatóságnak vagy az egyes Tagállamok által e célra kijelölt testületnek kell kiadnia.

**1.8.3.8** A bizonyítvány megszerzéséhez a jelöltnek képzésben kell részt vennie, és a Tagállam illetékes hatósága által jóváhagyott vizsgát kell tennie.

**1.8.3.9** A képzés fő célja, hogy a jelölt megfelelő tudást szerezzen a veszélyes áruk szállításában rejlő veszélyekről, az adott szállítási módra vonatkozó jogszabályokról, rendeletekről és hatósági előírásokról, valamint az 1.8.3.3 bekezdés szerinti feladatokról.

**1.8.3.10** A vizsgát az illetékes hatóságnak vagy az általa kinevezett vizsgáztató szervezetnek kell megszerveznie. Képzőszerv nem lehet vizsgáztató szervezet.

A vizsgáztató szervezetet írásban kell kinevezni. A kinevezést, amely korlátozott időtartamú is lehet, a következő kritériumok alapján kell kiadni:

- a vizsgáztató szervezet szakmai alkalmassága;
- a vizsgáztató szervezet által javasolt vizsgáztatási forma részletes leírása;
- a vizsgáztatás pártatlanságának biztosítására vonatkozó intézkedések;
- a szervezet függetlensége bármely, biztonsági tanácsadót alkalmazó természetes vagy

jogi személytől.

#### 1.8.3.11

A vizsga célja meggyőződni arról, hogy a jelölt az 1.8.3.7 bekezdésben előírt bizonyítvány megszerzéséhez elegendő szintű tudással rendelkezik-e a tanácsadóra háruló, az 1.8.3.3 bekezdésben felsorolt feladatok ellátásához. A vizsgának a következő témákra kell kiterjednie:

- a) A veszélyes árukkal kapcsolatos balesetek lehetséges következményeinek és a balesetek fő okainak ismerete;
- b) A belföldi jog, a nemzetközi megállapodások és egyezmények előírásai, különös tekintettel az alábbiakra:
  - a veszélyes áruk besorolása (az oldatok és keverékek besorolási eljárása, az anyagfelsorolás felépítése, a veszélyes áru osztályok és az osztályba sorolás elvei, a szállított veszélyes áruk jellemzői, fizikai, kémiai és toxikológiai (mérgező) tulajdonságai);
  - általános csomagolási előírások, a tartányokra és tankkonténerekre vonatkozó előírások (típusok, kódolás, jelölés, szerkezeti felépítés, első alkalommal végzett és időszakos vizsgálatok);
  - feliratozás, bárcázás, nagybárcák és narancssárga tábla elhelyezése (a küldeménydarabok jelölése és bárcázása, a nagybárcák és a narancssárga táblák elhelyezése és eltávolítása);
  - bejegyzések a fuvarokmányokba (szükséges információk);
  - a feladási módok és a feladási korlátozások (kocsirakomány, teljes rakomány, ömlesztett fuvarozás, fuvarozás IBC-kben, fuvarozás konténerekben, fuvarozás rögzített és leszerelhető tartányokban);
  - utasok szállítása;
  - együvé rakási tilalmak és elővigyázatossági intézkedések az együvé rakáskor;
  - az áruk elkülönítése;
  - a szállított mennyiség korlátozása és a mentesített mennyiségek;
  - árukezelés és rakományrögzítés (be- és kirakás – töltési fok –, átmeneti tárolás és elkülönítés);
  - berakás előtti és kirakás utáni tisztítás, illetve gáztalanítás;
  - személyzet, illetve kísérők képzése;
  - árukísérő okmányok (fuvarokmány, az esetleges eltérések vagy kivételek másolatai, egyéb okmányok);
  - környezetszennyező anyagok működés közbeni kibocsátása vagy véletlen kifolyása;
  - szállítóeszközökre vonatkozó követelmények.

#### 1.8.3.12 A vizsga

**1.8.3.12.1** A vizsgának írásbelinek kell lennie, ami kiegészíthető szóbeli vizsgával is.

**1.8.3.12.2** A nemzetközi és a belföldi szabályzatokon kívül egyéb segédanyagot az írásbeli vizsgán nem szabad használni.

**1.8.3.12.3** Elektronikus eszközöket csak akkor szabad használni, ha a vizsgáztató szervezet bocsátja rendelkezésre. Az elektronikus eszköz csak olyan lehet, amelybe a vizsgázó nem tud további adatokat bevinni, csak a feltett kérdésre tud válaszolni.

**1.8.3.12.4** Az írásbeli vizsgának két részből kell állnia:

- a) A jelöltnek egy kérdőívet kell kapnia. A kérdőívnek legalább 20 kiegészítendő kérdést kell tartalmaznia, amelyek legalább az 1.8.3.11 bekezdésben felsorolt témákra terjednek ki. Feleletválasztós kérdéseket is lehet alkalmazni, ez esetben két feleletválasztós kérdés egyenértékű egy kiegészítendő kérdéssel. A témák között különös figyelmet kell szentelni a következőknek:
- általános megelőző és biztonsági intézkedések;
  - a veszélyes áruk besorolása;
  - általános csomagolási előírások, beleértve a tartányokra, a tankkonténerekre és a tartálykocsikra vonatkozó előírásokat;
  - a veszély jelölése és a veszélyességi bárcák;
  - a fuvarokmányban levő bejegyzések;
  - árukezelés és rakodás;
  - a személyzet szakképzése;
  - árukísérő okmányok és fuvarokmányok;
  - a szállítóeszközökre és felszerelésükre vonatkozó előírások.
- b) A jelöltnek egy esettanulmányt is ki kell dolgoznia a tanácsadó 1.8.3.3 bekezdésben felsorolt feladataira vonatkozóan, amivel bizonyítja, hogy képes a tanácsadó feladatainak ellátására.

**1.8.3.13** A Tagállamok rendelkezhetnek úgy, hogy azok a jelöltek, akik olyan vállalkozásnál kívánnak dolgozni, amely bizonyos veszélyes áruk szállítására szakosodott, csak az e tevékenységgel kapcsolatos témákból vizsgázzanak. Ezek a veszélyes árucsoportok a következők lehetnek:

- 1 osztály;
- 2 osztály;
- 7 osztály;
- 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 6.2, 8 és 9 osztály;
- az UN 1202, 1203, 1223, 3475 számú anyagok, és az UN 1268 és 1863 alá tartozó repülőgép tüzelőanyagok.

Az 1.8.3.7 bekezdésben előírt bizonyítványból egyértelműen ki kell tűnnie, hogy csak azokra, az e bekezdésben foglalt árucsoport(ok)ra érvényes, amelyekből a jelölt az 1.8.3.12 bekezdés szerinti követelményeknek megfelelően vizsgát tett.

Azok a veszélyes áru szállítási biztonsági tanácsadói bizonyítványok, amelyeket 2009. január 1-je előtt bocsátottak ki és az UN 1202, 1203 és 1223 számú anyagokra érvényesek, az UN 3475 számú anyagra, valamint az UN 1268 és 1863 alá tartozó repülőgép tüzelőanyagokra is érvényesek.

**1.8.3.14** Az illetékes hatóságnak vagy a vizsgáztató szervezetnek a vizsgakérdésekből gyűjteményt kell készítenie.

- 1.8.3.15** Az 1.8.3.7 bekezdésben előírt bizonyítványt az 1.8.3.18 bekezdés szerinti formában kell kiállítani. A bizonyítványt minden Tagállam köteles elismerni.
- 1.8.3.16** *A bizonyítvány érvényessége és megújítása*
- 1.8.3.16.1** A bizonyítvány öt évig érvényes. A bizonyítvány érvényességi idejét meg kell hosszabbítani, esetenként az érvényességének lejártától számított öt évvel, ha tulajdonosa a bizonyítvány érvényességének lejártá előtti egy éven belül sikeres vizsgát tett. A vizsgáztatást az illetékes hatóságnak jóvá kell hagynia.
- 1.8.3.16.2** A vizsga célja meggyőződni arról, hogy a bizonyítvány tulajdonosa rendelkezik-e az 1.8.3.3 bekezdésben felsorolt feladatok ellátásához szükséges ismeretekkel. A szükséges ismeretek az 1.8.3.11 b) pontban vannak felsorolva, amely ismereteknek ki kell terjedniük a bizonyítvány kiadása (legutóbbi meghosszabbítása) óta eltelt időben az előírásokban bekövetkezett változásokra is. A vizsgát az 1.8.3.10 és 1.8.3.12 – 1.8.3.14 bekezdésben előírtak szerint kell szervezni és felügyelni. A bizonyítvány tulajdonosának azonban nem kell az 1.8.3.12.4 b) pontban említett esettanulmányt kidolgoznia.
- 1.8.3.17** Az 1.8.3.1 – 1.8.3.16 bekezdés követelményei teljesítettnek tekinthetők, ha a veszélyes áruk közúti, vasúti és belvízi szállításánál alkalmazandó biztonsági tanácsadó kinevezéséről és szakmai képzéséről szóló, a Tanács 1996. június 3-i 96/35/EK Irányelvének<sup>13)</sup>, ill. a veszélyes áruk közúti, vasúti és belvízi szállítási biztonsági tanácsadó minimum vizsgakövetelményeiről szóló, az Európai Parlament és a Tanács 2000. április 17-i 2000/18/EK Irányelvének<sup>14)</sup> előírásait alkalmazzák.

---

13) Az EK Hivatalos Lapja, L 145. szám, 1996. 06. 19., 10. o.

14) Az EK Hivatalos Lapja, L 118. szám, 2000. 05. 19., 41. o.

**1.8.4 Az illetékes hatóságok és az általuk kijelölt szervezetek jegyzéke**

A Tagállamoknak közölniük kell az OTIF Titkárságával az általuk kijelölt azon hatóságok és szervezetek címét, amelyek a RID végrehajtására vonatkozó belföldi jogszabályaik szerint illetékesek. Minden esetben meg kell adni a RID azon előírásait, amelyre vonatkozóan illetékesek, ill. azt a címet, amelyre a kérelmeket be lehet nyújtani.

Az OTIF Titkársága a kapott információk alapján jegyzéket állít össze és azt napra kész állapotban tartja. Ezt a jegyzéket és annak módosításait elküldi a Tagállamoknak.

**1.8.5 A veszélyes árukkal kapcsolatos eseményekről szóló jelentés**

**1.8.5.1** Amennyiben a veszélyes áru szállítása, berakása, töltése vagy kirakása során valamely Tagállam területén jelentős baleset vagy káresemény következett be, a fuvarozónak, a berakónak, a töltőnek, ill. a címzettnek vagy adott esetben a vasúti infrastruktúra üzemeltetőjének meg kell győződnie arról, hogy az érintett Tagállam illetékes hatósága számára az 1.8.5.4 bekezdésben szereplő minta szerinti jelentés készül.

**1.8.5.2** A Tagállamnak szükség esetén ugyancsak jelentést kell készítenie az OTIF Titkárságának a többi Tagállam informálása céljából.

**1.8.5.3**

Az 1.8.5.1 bekezdés szerinti jelentést akkor kell elkészíteni, ha a következő események közül egy vagy több bekövetkezett: a veszélyes áru kiszabadult vagy kiszabadulásának közvetlen veszélye állt fenn, személyi sérülés, anyagi kár vagy a környezet károsodása következett be, vagy a hatóságok beavatkoztak. Ennek megítélésénél a következő kritériumokat kell alkalmazni:

A „személyi sérülés” olyan esemény, amelyben a szállított veszélyes áruval közvetlenül kapcsolatba hozható sérülés vagy haláleset következik be, és a sérülés:

- a) intenzív orvosi kezelést igényel,
- b) legalább egy napos kórházi tartózkodást igényel, vagy
- c) legalább három, egymást követő napig munkaképtelenséget okoz.

A „veszélyes áru kiszabadulás”

- a) a 0 vagy az 1 szállítási kategóriába tartozó veszélyes árunak legalább 50 kg vagy 50 l mennyiségben,
- b) a 2 szállítási kategóriába tartozó veszélyes árunak legalább 333 kg vagy 333 l mennyiségben, vagy
- c) a 3 vagy a 4 szállítási kategóriába tartozó veszélyes árunak legalább 1000 kg vagy 1000 l mennyiségben

történő szabaddá válása.

A „veszélyes áru kiszabadulás” kritériuma akkor is teljesül, ha a veszélyes áru kiszabadulásának közvetlen veszélye állt fenn az előzőekben említett mennyiségekben. Ezt rendszerint akkor kell feltételezni, ha a szerkezeti sérülés következtében a csomagolóeszköz nem alkalmas a további szállításra, vagy ha bármilyen más okból a megfelelő biztonsági szint már nem áll fenn (pl. a tartányok vagy konténerek deformálódása, a tartány felborulása vagy a közvetlen közelben levő tűz miatt).

A 6.2 osztály veszélyes áru esetén a jelentési kötelezettség a mennyiségtől függetlenül fennáll.

Ha az eset a 7. osztály anyagával történik, a „veszélyes áru kiszabadulás” kritériumai a következők:

- a) radioaktív anyag bármilyen kiszabadulása a küldeménydarabból;
- b) olyan sugárterhelés bekövetkezése, amely meghaladja a dolgozók és a lakosság ionizáló sugárzással szembeni védelmét szabályozó előírások határértékeit (NAÜ 115. sz. Biztonsági Sorozat, II. Rész – „Nemzetközi alapvető biztonsági szabványok az ionizáló sugárzással szembeni védelemre és a sugárforrások biztonságára”); vagy
- c) ha okkal feltételezhető, hogy a küldeménydarab valamelyik biztonsági funkciójának (megtartás, árnyékolás, hővédelem vagy kritikusság) jelentős csökkenése következett be, ami a küldeménydarabot alkalmatlanná teszi a további szállításra kiegészítő biztonsági intézkedések nélkül.

**Megjegyzés:** Azon küldeményekre, amelyek nem szolgáltatathatók ki, lásd a 7.5.11 szakasz CW33 előírás 6) bekezdését.

Az „anyagi kár” vagy a „környezet károsodása” a veszélyes áru kiszabadulását jelenti, függetlenül annak mennyiségétől, ha a kár becsült értéke meghaladja az 50 000 eurót. A veszélyes árut tartalmazó szállítóeszközben és a közlekedési infrastruktúrában keletkezett kárt ebből a szempontból figyelmen kívül kell hagyni.

A „hatósági beavatkozás” a hatóságok vagy kárelhárító szolgálatok közvetlen beavatkozása a veszélyes áruval kapcsolatos eseménybe, és személyek legalább három órára történő evakuálása vagy közforgalmú közlekedési útvonalak (utak, vasútvonalak) legalább három órára történő lezárása a veszélyes áru által okozott veszélyhelyzet miatt.

Szükség esetén az illetékes hatóság további, érdemi információt kérhet.

*Szükség esetén az illetékes hatóság további, érdemi információt kérhet.*

**1.8.6 Az 1.8.7 szakaszban leírt megfelelésértékelés, időszakos és soron kívüli vizsgálatok hatósági felügyelete**

**1.8.6.1** Az illetékes hatóság az 1.8.7 szakaszban meghatározott megfelelésértékelés, időszakos és soron kívüli vizsgálat, valamint az üzemi vizsgálóhely felügyelete céljából vizsgáló szervezeteket hagyhat jóvá.

**1.8.6.2** Az illetékes hatóságnak gondoskodnia kell a vizsgáló szervezet felügyeletéről, és ha azt állapítja meg, hogy a jóváhagyott szervezet nem felel meg a jóváhagyásban vagy az 1.8.6.4 bekezdésben foglaltaknak, vagy nem követi a RID előírásaiban meghatározott eljárás(oka)t, a jóváhagyást vissza kell vonnia vagy korlátoznia kell az érvényességét.

**1.8.6.3** Ha egy jóváhagyást visszavontak vagy az érvényességét korlátozták, vagy a vizsgáló szervezet felhagyott a tevékenységgel, az illetékes hatóságnak meg kell tennie a szükséges lépéseket, hogy az iratokat vagy egy másik vizsgáló szervezet kezelje vagy biztosítani kell, hogy az iratok továbbra is hozzáférhetőek legyenek.

**1.8.6.4** A vizsgáló szervezetnek:

- a) szervezetbe integrált, alkalmas, hozzáértő, szakképzett és gyakorlott személyzettel kell rendelkeznie, hogy műszaki feladatait megfelelő módon végezhesse;
- b) alkalmas és elegendő berendezésnek és felszerelésnek kell rendelkezésére állnia;
- c) részrehajlás nélkül kell működnie, és minden olyan hatástól mentesnek kell lennie, ami ebben akadályozhatná;
- d) a gyártók és más szervezetek kereskedelmi és tulajdonjogi védelmet élvező tevékenységeit üzleti titokként kell kezelnie;
- e) egyértelműen el kell különítenie a vizsgáló szervezeti funkcióit és az ezzel nem kapcsolatos tevékenységet;
- f) dokumentált minőségbiztosítási rendszerrel kell rendelkeznie;
- g) biztosítani kell, hogy a vonatkozó szabványokban és a RID-ben szereplő vizsgálatokat elvégezzék; és
- h) az 1.8.7 szakaszban foglaltak szerinti célszerű és megfelelő jegyzőkönyvezési és okirat nyilvántartási rendszert kell működtetni.

A vizsgáló szervezetet az EN ISO/IEC 17020:2004 szabvány szerint akkreditálni is kell, a 6.2.3.6 bekezdés és a 6.8.4 szakasz TA4 és TT9 különleges előírásának megfelelően.

Az új tevékenységet kezdő vizsgáló szervezetet ideiglenesen is jóvá lehet hagyni. Az ideiglenes kijelölés előtt az illetékes hatóságnak meg kell győződnie arról, hogy a vizsgáló szervezet megfelel az EN ISO/IEC 17020:2004 szabvány követelményeinek. Annak érdekében, hogy a vizsgáló szervezet tovább folytathassa ezt az új tevékenységet, a tevékenység első évében akkreditálni kell.

**1.8.7 A megfelelésértékelésre és az időszakos vizsgálatokra vonatkozó előírások**

**Megjegyzés:** E szakasz alkalmazásában az „illetékes szervezet” az a szervezet, amelyet az UN nyomástartó tartályok tanúsítására a 6.2.2.9 bekezdés, a nem UN nyomástartó tartályok jóváhagyására a 6.2.3.6 bekezdés, valamint a 6.8.4 szakasz TA4 és TT9 különleges előírása határoz meg.

**1.8.7.1** *Általános előírások*

**1.8.7.1.1** Az 1.8.7 szakasz szerinti eljárásokat a nem UN nyomástartó tartályok engedélyezése során a 6.2.3.6 bekezdés táblázata, a tartányok, a battériás kocsik és a MEG-konténerek jóváhagyása során a 6.8.4 szakasz TA4 és TT9 különleges előírása szerint kell alkalmazni.

Az 1.8.7 szakasz szerinti eljárásokat az UN nyomástartó tartályok tanúsítása során a 6.2.2.9 bekezdés táblázata szerint lehet alkalmazni.

**1.8.7.1.2** A kérelmező

- a) az 1.8.7.2 bekezdés szerinti típusjóváhagyás;
- b) az 1.8.7.3 bekezdés szerinti gyártás felügyelet és az 1.8.7.4 bekezdés szerinti üzembe helyezés előtti vizsgálat;
- c) az 1.8.7.5 bekezdés szerinti időszakos és soron kívüli vizsgálat

iránti kérelmét a saját választása szerinti, egyetlen illetékes hatósághoz, ill. megbízottjához vagy egyetlen jóváhagyott vizsgáló szervezethez nyújthatja be.

**1.8.7.1.3** A kérelemnek a következőket kell tartalmaznia:

- a) a kérelmező nevét és székhelyét;
- b) megfelelőség-értékelés esetén, ha a kérelmező nem azonos a gyártóval, akkor a gyártó nevét és székhelyét;
- c) írásos nyilatkozatot arról, hogy másik illetékes hatósághoz, ill. megbízottjához vagy más vizsgáló szervezethez nem nyújtottak be ugyanilyen kérelmet;
- d) az 1.8.7.7 bekezdésben leírt műszaki dokumentációt;
- e) nyilatkozatot arról, hogy az illetékes hatóságnak, ill. megbízottjának vagy a vizsgáló szervezetnek vizsgálati célból szabad belépést biztosít a gyártó-, vizsgáló- és tárolóhelyekre és rendelkezésére bocsát minden szükséges információt.

**1.8.7.1.4** Ha a kérelmező az illetékes hatóság, ill. az általa megbízott vizsgáló szervezet részére meggyőzően bizonyítani tudja, hogy megfelel az 1.8.7.6 bekezdésben foglaltaknak, akkor üzemi vizsgálóhelyet létesíthet azokra a vizsgálatokra (vagy azok egy részére), amelyekre a 6.2.2.9, ill. a 6.2.3.6 bekezdés megengedi.

**1.8.7.2** *Típusjóváhagyás***1.8.7.2.1** A kérelmezőnek

- a) nyomástartó tartályok esetén: a gyártani tervezett nyomástartó tartály mintadarabját az illetékes szervezet rendelkezésére kell bocsátania. Az illetékes szervezet további mintadarabokat is kérhet, ha a vizsgálati program úgy kívánja;
- b) tartányok, battériás kocsik és MEG-konténerek esetén: a prototípust hozzáférhetővé kell tennie a típusvizsgálat elvégzése céljából.

**1.8.7.2.2** Az illetékes szervezetnek

- a) meg kell vizsgálnia az 1.8.7.7.1 pont szerinti műszaki dokumentációt, hogy ellenőrizze, hogy a típus megfelel a vonatkozó RID előírásoknak, a prototípust vagy prototípus sorozatot a műszaki dokumentáció szerint gyártották és reprezentálja a típust;

- b) el kell végeznie a vizsgálatokat, ill. a RID-ben előírt próbák elvégzésénél jelen kell lennie, annak megállapítására, hogy az előírásokat alkalmazták és betartották, valamint a gyártó által alkalmazott eljárások megfelelnek a követelményeknek;
- c) felül kell vizsgálnia az (alap)anyag gyártó(k) által kiadott bizonylatokat a RID vonatkozó előírásai alapján;
- d) jóvá kell hagynia a szerkezeti elemek állandó kötéseinek kialakítására szolgáló eljárásokat, ill. ellenőriznie kell, hogy már jóváhagyták-e, valamint azt, hogy a szerkezeti elemek állandó kötését és a roncsolásmentes vizsgálatokat arra jogosult (képzett, ill. minősített) alkalmazottak végzik-e;
- e) meg kell állapodnia a kérelmezővel abban, hogy hol és milyen vizsgáló berendezésekkel hajtják végre a vizsgálatokat és a szükséges próbákat.

Az illetékes szervezetnek a kérelmező számára típusvizsgálati jegyzőkönyvet kell kiállítania.

**1.8.7.2.3** Az illetékes hatóságnak, ill. megbízottjának vagy a vizsgáló szervezetnek típusjóváhagyási bizonyítványt kell kiállítania, ha a típus megfelel az összes vonatkozó előírásnak.

A bizonyítványban fel kell tüntetni:

- a) a kiállító nevét és székhelyét;
- b) a gyártó nevét és székhelyét;
- c) arra való utalást, hogy a típusvizsgálat során a RID melyik változatát és mely szabványokat alkalmazták;
- d) a vizsgálatokból származó követelményeket,
- e) a megfelelő szabványokban meghatározott, a típus, ill. a típusváltozat azonosításához szükséges adatokat; és
- f) a típusvizsgálati jegyzőkönyv(ek)re való hivatkozást.

A bizonyítványhoz mellékelni kell a műszaki dokumentáció vonatkozó részeinek felsorolását (lásd az 1.8.7.7.1 pontot)

### **1.8.7.3** *A gyártás felügyelete*

**1.8.7.3.1** Annak biztosítására, hogy a terméket a típusjóváhagyás előírásai szerint gyártják, az illetékes szervezetnek felügyelnie kell a gyártási folyamatot.

**1.8.7.3.2** A kérelmezőnek minden szükséges intézkedést meg kell tennie annak biztosítására, hogy a gyártási folyamat megfelel a vonatkozó RID előírásoknak, valamint a típusjóváhagyási bizonyítvány, ill. mellékletei előírásainak.

**1.8.7.3.3** Az illetékes szervezetnek:

- a) ellenőriznie kell az 1.8.7.7.2 pontban leírt műszaki dokumentációnak való megfelelőséget;
- b) ellenőriznie kell, hogy a gyártási folyamatban olyan termékek készülnek, amelyek a rájuk vonatkozó követelményeknek és dokumentációnak megfelelnek;
- c) ellenőriznie kell az anyagok nyomonkövethetőségét, valamint a specifikációk alapján az (alap)anyag bizonylatokat;

- d) ellenőriznie kell, hogy a szerkezeti elemek állandó kötését és a roncsolásmentes vizsgálatokat arra jogosult (képzett, ill. minősített) alkalmazottak végzik-e;
- e) meg kell állapodnia a kérelmezővel a helyszínen, ahol a vizsgálatokat és a szükséges próbákat elvégzik; és
- f) az ellenőrzés eredményét jegyzőkönyvbe kell foglalnia.

#### **1.8.7.4** *Az üzembe helyezés előtti vizsgálat*

##### **1.8.7.4.1** A kérelmezőnek

- a) a RID-ben előírt jelölést fel kell vinnie; és
- b) az illetékes szervezet rendelkezésére kell bocsátania az 1.8.7.7 bekezdésben leírt műszaki dokumentációt.

##### **1.8.7.4.2** Az illetékes szervezetnek:

- a) el kell végeznie a szükséges vizsgálatokat és méréseket, annak ellenőrzésére, hogy a terméket a típusjóváhagyásnak és a vonatkozó előírásoknak megfelelően gyártották;
- b) az üzemi szerelvények gyártói által rendelkezésre bocsátott tanúsítványok alapján ellenőriznie kell az üzemi szerelvényeket;
- c) az elvégzett vizsgálatokra, ellenőrzésekre, valamint az átvizsgált műszaki dokumentációra vonatkozóan az üzembe helyezés előtti vizsgálatról jegyzőkönyvet kell kiállítania a kérelmező számára; és
- d) ha a gyártás megfelel az előírásoknak, akkor a gyártás megfelelőségére vonatkozó írásbeli tanúsítványt kell kiállítania, és el kell látnia az illetékes szervezet jelével.

A tanúsítvány és a jegyzőkönyv több, azonos típusú tételre is vonatkozhat (csoportos tanúsítvány vagy csoportos jegyzőkönyv).

##### **1.8.7.4.3** A bizonyítványban legalább a következőket kell feltüntetni:

- a) az illetékes szervezet nevét és székhelyét;
- b) a gyártó nevét és székhelyét, és ha nem a gyártó a kérelmező, akkor a kérelmező nevét és székhelyét is;
- c) arra való utalást, hogy az üzembe helyezés előtti vizsgálat során a RID melyik változatát és mely szabványokat alkalmazták;
- d) a vizsgálatok eredményét;
- e) a vizsgált termék(ek) azonosításához szükséges adatokat, de legalább a sorozatszámot, ill. nem újratölthető palackoknál a gyártási tétel számát, és
- f) a típusjóváhagyás számát.

#### **1.8.7.5** *Időszakos és soronkívüli vizsgálatok*

Az illetékes szervezetnek:

- a) el kell végeznie az azonosítást és ellenőriznie kell a dokumentációnak való megfelelőséget;

- b) végre kell hajtania a vizsgálatokat és jelen kell lennie a próbáknál, hogy ellenőrizze, hogy a követelményeket betartották;
- c) a vizsgálatokról és a próbákról jegyzőkönyvet kell kiállítania, a jegyzőkönyv több tételre is vonatkozhat; és
- d) biztosítania kell, hogy az előírt jelölést felvigyék.

#### **1.8.7.6** *A kérelmező üzemi vizsgálóhelyének felügyelete*

##### **1.8.7.6.1** A kérelmezőnek

- a) az üzemi vizsgálóhelyet az 1.8.7.7.5 pont szerint dokumentált, a vizsgálatokra vonatkozó minőségbiztosítási rendszer szerint kell kialakítani és felügyelni;
- b) teljesítenie kell a jóváhagyott minőségbiztosítási rendszerből eredő kötelezettségeit, és biztosítani kell, hogy a minőségbiztosítási rendszer megfelelő és hatékony maradjon;
- c) az üzemi vizsgálatra képzett és hozzáértő személyzetet kell kijelölnie;
- d) ahol szükséges, el kell helyeznie a vizsgáló szervezet jelét.

##### **1.8.7.6.2** A vizsgáló szervezetnek kezdeti auditálást kell végeznie, és ha ez kielégítő, legfeljebb három évig tartó időszakra szóló engedélyt kell kiadnia. Ennek során a következő előírásokat kell betartani:

- a) az audittal igazolni kell, hogy a termék vizsgálata a RID követelményei szerint történik;
- b) a vizsgáló szervezet felhatalmazhatja a kérelmező üzemi vizsgálóhelyét, hogy a vizsgáló szervezet jelét elhelyezze minden ellenőrzött termékre;
- c) az engedély a lejáta előtti utolsó évben végzett, kielégítő eredménnyel járó audit után megújítható. Az új érvényességi időszak az előző engedély lejárataól számít;
- d) a vizsgáló szervezet auditorainak kellő szakértelemmel kell rendelkezniük ahhoz, hogy elvégezzék azon termékek megfelelőség-értékelését, amelyre a minőségbiztosítási rendszer kiterjed.

##### **1.8.7.6.3** Az engedély érvényességi ideje alatt a vizsgáló szervezetnek időszakos felülvizsgálatokat kell tartania, hogy megbizonyosodjék, hogy a kérelmező továbbra is fenntartja és alkalmazza a minőségbiztosítási rendszert. Ennek során a következő előírásokat kell betartani:

- a) egy 12 hónapos időszakon belül legalább két felülvizsgálatot kell tartani;
- b) a vizsgáló szervezet további szemléket, képzést, műszaki változtatásokat, vagy a minőségbiztosítási rendszer módosítását írhatja elő, ill. a kérelmező által végezhető vizsgálatok körét korlátozhatja vagy megtilthatja.
- c) a vizsgáló szervezetnek a minőségbiztosítási rendszerben bekövetkezett minden változást értékelnie kell, és meg kell vizsgálnia, hogy a megváltozott minőségbiztosítási rendszer megfelel-e a kezdeti audit követelményeinek vagy teljes újraértékelés szükséges;
- d) a vizsgáló szervezet auditorainak kellő szakértelemmel kell rendelkezniük ahhoz, hogy elvégezzék azon termékek megfelelőség-értékelését, amelyre a minőségbiztosítási rendszer kiterjed; és
- e) a vizsgáló szervezetnek a szemléről, ill. felülvizsgálatról, és ha próbákat végeztek, azok eredményéről jegyzőkönyvet kell készítenie a kérelmező számára.

**1.8.7.6.4** A vizsgáló szervezetnek gondoskodnia kell arról, hogy amennyiben a vonatkozó követelményeknek nem felelnek meg, a kijavításhoz szükséges intézkedések megtörténjenek. Ha a kijavításhoz szükséges intézkedések mégsem történnek meg kellő időben, az üzemi vizsgálóhely tevékenységére vonatkozó engedélyt a vizsgáló szervezet visszavonhatja vagy felfüggesztheti. A visszavonásról, ill. felfüggesztésről értesíteni kell az illetékes hatóságot. A vizsgáló szervezet döntésének részletes indokait a kérelmező számára jegyzőkönyvbe kell foglalni.

**1.8.7.7** *Dokumentáció*

A műszaki dokumentációnak alkalmasnak kell lennie arra, hogy belőle a vonatkozó követelményeknek való megfelelés megállapítható legyen.

**1.8.7.7.1** *A típusjóváhagyáshoz szükséges dokumentumok*

A kérelmezőnek – értelemszerűen – a következő dokumentumokat kell rendelkezésre bocsátania:

- a) a tervezésnél és a gyártásnál alkalmazott szabványok jegyzékét;
- b) a típus és a típusvariánsok leírását ;
- c) a 3.2 fejezet „A” táblázat vonatkozó oszlopában található utasításokat vagy a csak bizonyos anyagok szállítására szolgáló termékeknek az anyagok felsorolását ;
- d) az általános összeállítási rajzo(ka)t;
- e) a megfelelés-értékeléséhez szükséges részletrajzokat, amelyeken fel vannak tüntetve a számításokhoz használt méretek, a szerkezeti és az üzemi szerelvények, a jelölések és/vagy bárcák;
- f) a számításokat, az eredményeket és következtetéseket;
- g) az üzemi szerelvények jegyzékét a műszaki adataikkal, a biztonsági szerkezetekre vonatkozó információt a lefúvási teljesítmény számításával;
- h) a szabványok által a szerkezeti elemek, azok részei, a bevonatok, burkolatok, a szerkezeti és az üzemi szerelvények gyártásához előírt anyagok jegyzékét, a megfelelő anyagspecifikációkat vagy a RID-nek való megfelelést igazoló nyilatkozatot;
- i) az állandó kötések kialakítására szolgáló jóváhagyott eljárásokat;
- j) a hőkezelési eljárás(ok) leírását; és
- k) a típusjóváhagyásra és a gyártásra a szabványokban, ill. a RID-ben felsorolt minden vonatkozó vizsgálat végrehajtásának módját, leírását és jegyzőkönyveit.

**1.8.7.7.2** *A gyártás felügyeletéhez szükséges dokumentumok*

A kérelmezőnek – értelemszerűen – a következő dokumentumokat kell rendelkezésre bocsátania:

- a) az 1.8.7.7.1 pontban felsorolt dokumentumokat;
- b) a gyártási és a vizsgálati eljárások dokumentációját;
- c) a gyártási naplót;
- d) állandó kötések kivitelező alkalmazottak jogosultságát;

- e) a roncsolásmentes vizsgálatokat végző alkalmazottak jogosultságát;
- f) a roncsolásos és a roncsolásmentes vizsgálatok jegyzőkönyveit;
- g) a hőkezelési eljárások jegyzőkönyveit; és
- h) a hitelesítési jegyzőkönyveket.

**1.8.7.7.3** *Az üzembe helyezés előtti vizsgálatokhoz szükséges dokumentumok*

A kérelmezőnek – értelemszerűen – a következők dokumentumokat kell rendelkezésre bocsátania:

- a) az 1.8.7.7.1 és az 1.8.7.7.2 pontban felsorolt dokumentumokat;
- b) a termék és alkatrészeinek anyagbizonylatait;
- c) az üzemi szerelvények anyagbizonylatait és a megfelelőségi nyilatkozatokat;
- d) megfelelőségi nyilatkozatot, beleértve a termék és a típusbizonyítványban szereplő típusvariánsok leírását.

**1.8.7.7.4** *Az időszakos és a soron kívüli vizsgálatokhoz szükséges dokumentumok*

A kérelmezőnek – értelemszerűen – a következők dokumentumokat kell rendelkezésre bocsátania:

- a) nyomástartó tartályoknál, ha a gyártásra és az időszakos vizsgálatokra vonatkozó szabványok előírják, a különleges követelményekre vonatkozó dokumentációt;
- b) tartályoknál:
  - i) tartály-vizsgálati könyvet (gépkönyvet); és
  - ii) az 1.8.7.7.1 – 1.8.7.7.3 pontban említett, egy vagy több dokumentumot.

**1.8.7.7.5** *Az üzemi vizsgálóhely értékeléséhez szükséges dokumentumok*

Az üzemi vizsgálóhely kérelmezőjének a – értelemszerűen – a minőségbiztosítási rendszer következő dokumentumait kell rendelkezésre bocsátania:

- a) a szervezeti felépítést és a felelőségek megoszlását;
- b) a vizsgálatokra, a minőségellenőrzésre, a minőségbiztosításra és a munkafolyamatokra vonatkozó, megfelelő utasításokat, és a rendszeresen végzendő tevékenységeket;
- c) a minőségügyi nyilvántartást, pl. a vizsgálati jegyzőkönyveket, a vizsgálati eredményeket és hitelesítési adatokat, ill. tanúsítványokat;
- d) a vezetői felülvizsgálatokat az 1.8.7.6 bekezdés szerinti auditálás alapján a minőségbiztosítási rendszer hatékony működésének biztosításához;
- e) a vevők igényeinek kielégítését és a jogszabályok követelményeinek betartását szolgáló eljárások leírását;
- f) a dokumentáció ellenőrzési és karbantartási eljárását,
- g) nem megfelelő termékekkel kapcsolatos eljárást;
- h) az érintett személyekre vonatkozó képzési programot és minősítési eljárást.

**1.8.7.8*****A szabvány szerint gyártott, jóváhagyott és vizsgált termékek***

Az 1.8.7.7 bekezdés követelményei a következő szabványok alkalmazása esetén teljesítettnek tekinthetők.

<b>A vonatkozó bekezdés, ill. pont</b>	<b>Hivatkozás</b>	<b>A dokumentum címe</b>
1.8.7.7.1 – 1.8.7.7.4	EN 12972:2007	Veszélyes anyagok szállítótartályai. A fém szállítótartályok vizsgálata, ellenőrzése és megjelölése

## 1.9 fejezet

### A fuvarozás korlátozása az illetékes hatóságok által

**1.9.1** Bármely Tagállam a veszélyes áruk területén történő nemzetközi vasúti fuvarozására kiegészítő előírásokat hozhat olyan kérdésekben, amelyekről a RID nem rendelkezik, feltéve, hogy ezek a kiegészítő előírások

- összhangban vannak az 1.9.2 szakasz előírásaival;
- nem állnak ellentétben az 1.1.2 b) bekezdés előírásaival;
- a Tagállam belföldi jogrendjének részét képezik, és egyaránt érvényesek a veszélyes áruknak a Tagállam területén történő belföldi vasúti fuvarozására is;
- nem tiltják a hatályuk alá tartozó veszélyes áruk vasúti fuvarozását a Tagállam teljes területén.

**1.9.2** Az 1.9.1 szakasz hatálya alá eső kiegészítő előírások a következők:

- a) kiegészítő biztonsági követelmények vagy a biztonságot szolgáló korlátozások olyan fuvarozásokra,
  - amelyek során bizonyos építményeket, pl. hidakat vagy alagutakat<sup>15)</sup> használnak;
  - amelyek során kombinált fuvarozási eszközöket, pl. átrakóberendezéseket használnak; vagy
  - amelyek kikötőkben, pályaudvarokon vagy más közlekedési terminálokon kezdődnek vagy végződnek;
- b) olyan előírások, amelyek meghatározott veszélyes áruk fuvarozását a különleges és helyi kockázattal járó vonalszakaszokon, pl. a lakott területeken, környezetvédelmi szempontból érzékeny területeken, kereskedelmi központokon, veszélyes berendezéseket tartalmazó ipari övezeteken áthaladó szakaszokon tiltják vagy különleges feltételek, pl. vasútiüzemi intézkedések (sebességkorlátozás, meghatározott fuvarozási időszak, találkozási tilalom stb.) betartásához kötik. Az illetékes hatóságnak – amennyiben lehetséges – meg kell határoznia azokat a vonalakat, amelyek a tiltott vagy csak különleges feltételek betartásával használható vonalszakaszok helyett használhatók;
- c) kizárt vagy előírt vonalszakaszokat meghatározó különleges előírások, ill. a szélsőséges időjárási viszonyok, földrengés, baleset, sztrájk, állampolgári zavargások vagy háborús cselekmények miatti átmeneti várakozások esetén betartandó előírások.

**1.9.3** Az 1.9.2 a) és b) bekezdés szerinti kiegészítő előírások alkalmazása feltételezi, hogy az illetékes hatóság az intézkedések szükségességét bizonyítja<sup>16)</sup>.

**1.9.4** Azon Tagállam illetékes hatóságának, amely a területén az 1.9.2 a) és b) bekezdés szerinti kiegészítő előírásokat alkalmaz, ezekről az előírásokról előzetesen értesítenie kell az OTIF Titkárságát, hogy az a Tagállamok tudomására hozhassa.

15) Csatorna Alagúton, ill. hasonló adottságokkal rendelkező egyéb alagutakon keresztüli fuvarozásra lásd a Tanács veszélyes áruk vasúti fuvarozására vonatkozó 96/49/EK Irányelve (az EK Hivatalos Lapja, L 235. szám, 1996.09.17., 25. o.) 5 cikkének 2 a) és b) bekezdését.

16) Iránymutatóként használható a RID Szakértő Bizottság 2005. november 24-i ülésén jóváhagyott „The Generic Guideline for the Calculation of Risk inherent in the Carriage of Dangerous Goods by Rail” (Általános Útmutató a veszélyes áruk vasúti szállításában rejlő kockázatok elemzéséhez), mely elérhető az OTIF weboldalán ([www.otif.org](http://www.otif.org)).

**1.9.5**

A Tagállamok – függetlenül az előző szakaszok előírásaitól – a veszélyes áruk nemzetközi vasúti fuvarozására különleges biztonsági előírásokat is hozhatnak, amennyiben a szóbanforgó kérdést a RID nem szabályozza; különösen:

- a vasúti forgalomra;
- a fuvarozott veszélyes árukra vonatkozó adatok kezelésére;
- a szállítási tevékenységekkel kapcsolatos vasútüzemi szabályokra, pl. kocsirendezésre vagy kocsi félreállításra;

feltéve, hogy ezek az előírások a Tagállam belföldi jogrendjének részét képezik, és egyaránt érvényesek a veszélyes árukra a Tagállam területén történő belföldi vasúti fuvarozására is.

Ezek a különleges előírások azonban nem vonatkozhatnak a RID hatálya alá tartozó területekre, és különösen nem az 1.1.2 a) és 1.1.2 b) bekezdésben meghatározottakra.

## 1.10 fejezet

### Közbiztonsági előírások

**Megjegyzés:** E fejezet alkalmazásában a „közbiztonság” alatt értendők azok a rendszabályok és óvintézkedések, amelyek célja, hogy a lehető legkevesebbre csökkentsék a veszélyes áruk eltulajdonítását, ill. a velük való visszaéléseket, amelyek az embereket, az anyagi javakat vagy a környezetet veszélyeztetik.

#### 1.10.1 Általános előírások

**1.10.1.1** Mindenkinnek, aki a veszélyes áru szállításával kapcsolatba kerül, felelősségéhez mérten figyelembe kell vennie az ebben a fejezetben meghatározott közbiztonsági követelményeket.

**1.10.1.2** Veszélyes áru szállításával csak megfelelően azonosított fuvarozó bízható meg.

**1.10.1.3** Az átmeneti tárolóhelyeken, ill. terminálokon, jármű telephelyeken, kikötőkön és rendezőpályaudvarokon belül a veszélyes áruk szállítása során átmeneti tárolásra használt területeket megfelelően biztosítani kell, jól meg kell világítani és ha lehetséges és indokolt, az illetéktelenek elől el kell zárni.

**1.10.1.4** A veszélyes árut szállító vonat személyzetének a szállítás alatt fényképes személyazonosító okmányt kell magánál tartania.

**1.10.1.5** Az 1.8.1 szakasz szerinti biztonsági ellenőrzéseknek ki kell terjedniük a megfelelő közbiztonsági intézkedésekre is.

#### 1.10.2 Közbiztonsági képzés

**1.10.2.1** Az 1.3 fejezetben meghatározott képzésnek és ismeretfelújító oktatásnak a közbiztonsági szempontok tudatosítására is ki kell terjedniük. A közbiztonsággal kapcsolatos ismeretfelújító oktatást nem kell feltétlenül a szabályozásban bekövetkezett változások oktatásával összekapcsolni.

**1.10.2.2** A közbiztonsági szempontok tudatosítása során foglalkozni kell a közbiztonsági kockázat jellegével, a közbiztonsági kockázat felismerésével, a kockázatkezelés és -csökkentés módszereivel és a közbiztonság megsértése esetén teendő intézkedésekkel. Ha közbiztonsági terv szükséges, foglalkozni kell annak tudatosításával is, a résztvevők felelősségének és feladatainak, ill. a közbiztonsági terv végrehajtásában való részvételüknek arányában.

#### 1.10.3 A nagy közbiztonsági kockázattal járó veszélyes árukra vonatkozó előírások

**1.10.3.1** „Nagy közbiztonsági kockázattal járó veszélyes áruk” azok, amelyekkel terrorista cselekmények során vissza lehet élni, ami súlyos következményekkel járhat, pl. tömeges balesetet vagy tömegpusztítást idézhet elő. A nagy közbiztonsági kockázattal járó veszélyes árukat az 1.10.5 táblázat sorolja fel.

#### 1.10.3.2 Közbiztonsági terv

**1.10.3.2.1** A nagy közbiztonsági kockázattal járó áruk (lásd az 1.10.5 táblázatot) szállításában részt vevő, az 1.4.2 és az 1.4.3 szakaszban meghatározott szállítóknak, fuvarozóknak, feladóknak

és többi résztvevőnek olyan közbiztonsági tervet kell készíteniük, bevezetniük és annak megfelelően eljárniuk, amely legalább az 1.10.3.2.2 pontban meghatározott elemeket tartalmazza.

**1.10.3.2.2** A közbiztonsági tervnek legalább a következő elemekből kell állnia:

- a) a közbiztonsági rendszabályokért és óvintézkedésekért viselt felelősség részletes megosztása megfelelő hatáskörrel és képesítéssel rendelkező személyek között;
- b) az érintett veszélyes áruk, ill. veszélyes áru fajták nyilvántartása;
- c) a folyamatban levő tevékenységek felülvizsgálata és a közbiztonsági kockázat értékelése, beleértve a szállítási műveletek szükség szerinti megszakítását, a veszélyes áruk vasúti kocsiban, tartányban vagy konténerben tartását a szállítás előtt, alatt és után, ill. a veszélyes áruk átmeneti tárolását az intermodális szállítás vagy az egységek közötti átrakás során;
- d) a résztvevők felelősségével és feladatával arányban álló intézkedések egyértelmű meghatározása, amelyeket a közbiztonsági kockázat csökkentéséhez meg kell tenni, beleértve:
  - a képzést;
  - a közbiztonsági eljárásokat (pl. teendők súlyos fenyegetettség esetén; új, ill. áthelyezett alkalmazottak ellenőrzése stb.);
  - az üzemi eljárásokat [pl. útvonalak kiválasztása/használata, ahol ismeretes; hozzáférés a veszélyes árukhoz az átmeneti tárolóhelyeken (mint azt a c) pont meghatározza); érzékeny infrastruktúra közelsége stb.];
  - a közbiztonsági kockázat csökkentéséhez használandó eszközöket és forrásokat;
- e) hatékony, naprakész eljárások a közbiztonsági fenyegetettség, a közbiztonság megsértése, ill. a közbiztonságot érintő rendkívüli események kezelésére és jelentésére;
- f) a közbiztonsági terv értékelésére, ellenőrzésére, valamint a rendszeres felülvizsgálatára és korszerűsítésére vonatkozó eljárás;
- g) a közbiztonsági tervben szereplő szállítási információk fizikai védelmének biztosítására szolgáló intézkedések;
- h) intézkedések annak biztosítására, hogy a közbiztonsági tervben szereplő szállítási információkhoz csak az érdekeltek juthassanak hozzá. Ezek az intézkedések azonban nem akadályozhatják a RID-ben máshol előírt információk megadását.

**Megjegyzés:** *A fuvarozónak, a feladónak és a címzettnek együtt kell működniük egymással és az illetékes hatóságokkal\* a fenyegetésre vonatkozó információk kicserélésében, a megfelelő közbiztonsági intézkedések alkalmazásában és a közbiztonságot érintő rendkívüli események kezelésében.*

**1.10.3.3** Olyan készüléket, berendezést kell alkalmazni, ill. olyan intézkedést kell foganatosítani, amely megakadályozza, hogy a nagy közbiztonsági kockázattal járó veszélyes árut (lásd az 1.10.5 táblázatot) szállító vonatot, kocsit, ill. rakományát eltulajdonítsák, és biztosítani kell, hogy ezek az eszközök mindig jól működjenek. Az óvintézkedések azonban nem akadályozhatják a vészhelyzet elhárítását.

\* Magyarországon lásd a 62/2007. (XII. 23.) IRM rendeletet.

**Megjegyzés:** *A nagy közbiztonsági kockázattal járó veszélyes áruk (lásd az 1.10.5 táblázatot) mozgásának ellenőrzésére a közlekedési telemetriai vagy egyéb nyomkövető módszereket kell alkalmazni, amennyiben arra alkalmasak és a hozzá szükséges eszközök rendelkezésre állnak, ill. fel vannak szerelve.*

- 1.10.4** Nem kell betartani az 1.10.1, az 1.10.2 és az 1.10.3 szakasz követelményeit, ha a küldeménydarabokban szállított mennyiség vasúti kocsinként, ill. nagykonténerenként nem haladja meg az 1.1.3.6.3 pontban meghatározott mennyiséget, kivéve az 1. osztály 1.4 alosztályába tartozó, UN 0104, 0237, 0255, 0267, 0289, 0361, 0365, 0366, 0440, 0441, 0455, 0456 és 0500 számú tárgyakat. Ezen kívül az 1.10.1, az 1.10.2 és az 1.10.3 szakasz követelményeit akkor sem kell betartani, ha az előző mondatban említett kocsinkénti/konténerenkénti mennyiséget tartányban vagy ömlesztve szállítják.
- 1.10.5** A következő táblázatban felsorolt és a megadottnál nagyobb mennyiségben szállított áruk nagy közbiztonsági kockázattal járó árunak minősülnek.

1.10.5 táblázat: A nagy közbiztonsági kockázattal járó veszélyes áruk felsorolása

Osz- tály	Alosz- tály	Anyag vagy tárgy	Mennyiség		
			Tartányban (l) <sup>c)</sup>	Ömlesztve (kg) <sup>d)</sup>	Küldemény- darabban (kg)
1	1.1	Robbanóanyagok és -tárgyak	a)	a)	0
	1.2	Robbanóanyagok és -tárgyak	a)	a)	0
	1.3	C összeférhetőségi csoportba tartozó robbanóanyagok és -tárgyak	a)	a)	0
	1.4	UN 0104, 0237, 0255, 0267, 0289, 0361, 0365, 0366, 0440, 0441, 0455, 0456 és 0500 alá tartozó robbanótárgyak	a)	a)	0
	1.5	Robbanóanyagok	0	a)	0
2		Gyúlékony gázok (a csak F betűt tartalmazó osztályozási kódok)	3000	a)	b)

7		Radioaktív anyagok	3000A <sub>1</sub> (különleges formájú), ill. 3000A <sub>2</sub> aktivitás B(U), B(M) vagy C típusú küldeménydarabban		
8		I csomagolási csoportba tartozó maró anyagok	3000	a)	b)

a) Tárgytalan.

b) Az 1.10.3 szakasz előírásait nem kell alkalmazni, akármennyi is a szállított mennyiség.

c) Az ebben az oszlopban megadott értékeket csak akkor kell alkalmazni, ha a 3.2 fejezet „A” táblázat 10 vagy 12 oszlopa szerint a tartányban való szállítás megengedett. Azokra az anyagokra vonatkozóan, amelyek tartányban való szállítása nem megengedett, ezen oszlop utasítása tárgytalan.

d) Az ebben az oszlopban megadott értékeket csak akkor kell alkalmazni, ha a 3.2 fejezet „A” táblázat 10 vagy 17 oszlopa szerint az ömlesztett szállítás megengedett. Azokra az anyagokra vonatkozóan, amelyek ömlesztett szállítása nem megengedett, ezen oszlop utasítása tárgytalan.

- 1.10.6**      Radioaktív anyagok esetén e fejezet előírásai teljesítettnek tekinthetők, ha betartják a Nukleáris anyagok fizikai védelméről szóló Egyezmény\*, valamint az IAEA INFCIRC/225(Rev.4) kiadvány előírásait.

## **1.11 fejezet**

### **Belső veszélyelhárítási terv rendezőpályaudvarokra**

A veszélyes áruk szállításához a rendezőpályaudvarokon belső veszélyelhárítási tervet kell készíteni.

A veszélyelhárítási terv célja, hogy a rendezőpályaudvarokon baleset vagy rendkívüli esemény alkalmával a résztvevők megfelelően működjenek együtt és a baleset vagy rendkívüli esemény emberekre vagy a környezetre gyakorolt hatása lehetőleg kis mértékű maradjon.

Ezen fejezet előírásai az UIC 201 Döntvény<sup>17)</sup> (Veszélyes áru szállítás – Útmutató a rendezőpályaudvarok veszélyelhárítási terve készítésére) alkalmazása esetén teljesítettnek tekinthetők.

---

17) A 2003. március 1-i kiadás.

## **2. Rész**

### **Osztályozás**

## 2.1 fejezet

### Általános előírások

#### 2.1.1 Bevezetés

##### 2.1.1.1 A RID szerint a veszélyes áruk osztályai a következők:

1 osztály	Robbanóanyagok és -tárgyak
2 osztály	Gázok
3 osztály	Gyúlékony folyékony anyagok
4.1 osztály	Gyúlékony szilárd anyagok, önreaktív anyagok és érzéketlenített, szilárd robbanóanyagok
4.2 osztály	Öngyulladásra hajlamos anyagok
4.3 osztály	Vízzel érintkezve gyúlékony gázokat fejlesztő anyagok
5.1 osztály	Gyújtó hatású (oxidáló) anyagok
5.2 osztály	Szerves peroxidok
6.1 osztály	Mérgező anyagok
6.2 osztály	Fertőző anyagok
7 osztály	Radioaktív anyagok
8 osztály	Maró anyagok
9 osztály	Különféle veszélyes anyagok és tárgyak.

##### 2.1.1.2 Az osztályokban minden tételhez UN szám van hozzárendelve. A következő tétel típusok használatosak:

- A. Egyedi tételek: egy-egy pontosan meghatározott anyagra vagy tárgyra vonatkozó tételek, beleértve az olyan tételeket is, amelyek egy anyag izomerjeire vonatkoznak, pl.:
- UN 1090 ACETON  
UN 1104 AMIL-ACETÁTOK  
UN 1194 ETIL-NITRIT OLDAT
- B. Generikus tételek: anyagok vagy tárgyak pontosan meghatározott csoportjára vonatkozó tételek, amelyek azonban nem m.n.n. tételek, pl.:
- UN 1133 RAGASZTÓK  
UN 1266 PARFÜM KÉSZÍTMÉNYEK  
UN 2757 SZILÁRD, MÉRGEZŐ KARBAMÁT PESZTICID  
UN 3101 B TÍPUSÚ, FOLYÉKONY SZERVES PEROXID
- C. Speciális m.n.n. tételek: meghatározott kémiai vagy műszaki tulajdonságokkal bíró, „másként meg nem nevezett” anyagok vagy tárgyak csoportjára vonatkozó tételek, pl.:
- UN 1477 SZERVETLEN NITRÁTOK, M.N.N.  
UN 1987 ALKOHOLOK, M.N.N.
- D. Általános m.n.n. tételek: egy vagy több veszélyes tulajdonsággal bíró, „másként meg nem nevezett” anyagok vagy tárgyak csoportjára vonatkozó tételek, pl.:
- UN 1325 GYÚLÉKONY, SZERVES, SZILÁRD ANYAG, M.N.N.

## UN 1993 GYÚLÉKONY FOLYÉKONY ANYAG, M.N.N.

A B., a C. és a D. pontban meghatározott tételeket gyűjtőmegnevezésnek nevezzük.

**2.1.1.3** Csomagolási szempontból az anyagok – az 1, a 2, az 5.2, a 6.2 és a 7 osztály anyagai, valamint a 4.1 osztály önreaktív anyagai kivételével – az általuk képviselt veszély mértéke szerint csomagolási csoportokhoz vannak hozzárendelve:

- |                         |                                |
|-------------------------|--------------------------------|
| I csomagolási csoport   | – nagyon veszélyes anyagok;    |
| II csomagolási csoport  | – közepesen veszélyes anyagok; |
| III csomagolási csoport | – kevésbé veszélyes anyagok.   |

A csomagolási csoporto(ka)t, amely(ek)hez egy anyag hozzá van rendelve, a 3.2 fejezet „A” táblázata tartalmazza.

**2.1.2 Az osztályozás alapelvei**

**2.1.2.1** Az egyes osztályok fogalmkörébe tartozó anyagok meghatározása az adott osztály 2.2.x.1 bekezdése szerinti tulajdonságaikon alapul. A veszélyes áruk hozzárendelése valamely osztályhoz és csomagolási csoporthoz az ugyanezen 2.2.x.1 bekezdésben szereplő kritériumok alapján történik. Egy vagy több járulékos veszély hozzárendelése a veszélyes anyagokhoz és tárgyakhoz az ezen veszélyeknek megfelelő osztály vagy osztályok 2.2.x.1 bekezdésében található kritériumai alapján történik.

**2.1.2.2** Minden veszélyes áru tétel a 3.2 fejezet „A” táblázatában van felsorolva az UN számok sorrendjében. Ez a táblázat tartalmazza a felsorolt árukra vonatkozó, lényeges információkat, így a megnevezést, az osztályt, a csomagolási csoporto(ka)t, a szükséges veszélyességi bárcá(ka)t, a csomagolási és szállítási előírásokat.

***Megjegyzés:** A tételek betűrendes jegyzékét a 3.2 fejezet „B” táblázata tartalmazza.*

**2.1.2.3** Az egyes osztályok 2.2.x.2 bekezdésében felsorolt vagy meghatározott veszélyes áruk a fuvarozásból ki vannak zárva.

**2.1.2.4** A név szerint nem említett árukat, vagyis azokat, amelyek sem egyedi tételként nem szerepelnek a 3.2 fejezet „A” táblázatában, sem az előzőekben említett 2.2.x.2 bekezdésekben nincsenek felsorolva vagy meghatározva, a 2.1.3 szakaszban lévő eljárás szerint kell a megfelelő osztályba sorolni. Ezen kívül meg kell határozni az esetleges járulékos veszélyt, illetve a csomagolási csoportot. Az osztály és az esetleges járulékos veszély, illetve csomagolási csoport eldöntése után a megfelelő UN számot kell meghatározni. A megfelelő gyűjtőmegnevezés (UN szám) kiválasztásának paramétereit az osztályok végén, a 2.2.x.3 bekezdésekben levő döntési fák (gyűjtőmegnevezések felsorolása) jelzik. Az anyag vagy tárgy tulajdonságait lefedő gyűjtőmegnevezések közül minden esetben a legjellegzetesebbet kell választani a 2.1.1.2 bekezdés B., C. és D. pontja szerinti rangsor alapján. Akkor és csak akkor sorolható egy anyag vagy tárgy a 2.1.1.2 bekezdés szerinti valamely D. típusú tételhez, ha sem B., sem C. típusú tételhez nem sorolható.

**2.1.2.5** A 2.3 fejezet vizsgálati eljárásai és az osztályok 2.2.x.1 bekezdésében meghatározott kritériumok alapján – amennyiben ezek között szerepel ez a lehetőség – az is megállapítható, hogy egyes osztályokban valamely anyag, keverék vagy oldat nem rendelkezik az adott osztály kritériumaival, annak ellenére, hogy a 3.2 fejezet „A” táblázatában név szerint szerepel. Ilyen esetben ez az anyag, keverék vagy oldat nem tekintendő az adott osztályhoz tartozónak.

**2.1.2.6** A besorolás szempontjából a 101,3 kPa nyomáson 20 °C vagy ez alatti olvadáspontú vagy olvadás kezdőpontú anyagokat kell folyékonyknak tekinteni. Azokat a viszkózus anyagokat,

amelyeknél határozott olvadáspont nem állapítható meg, az ASTM D 4359-90 szabvány szerinti vizsgálati eljárásnak vagy a 2.3.4 szakaszban leírt folyékonyság meghatározási vizsgálatnak (penetrométer eljárásnak) kell alávetni.

**2.1.3      A név szerint nem említett anyagok, oldatok és keverékek (készítmények és hulladékok) besorolása**

**2.1.3.1**      A név szerint nem említett anyagokat, oldatokat és keverékeket az egyes osztályok 2.2.x.1 bekezdésében található kritériumok alapján, az általuk képviselt veszély mértéke szerint kell besorolni. Az anyag által képviselt veszély(eke)t annak fizikai, kémiai jellemzői és fiziológiai tulajdonságai alapján kell meghatározni. Ezeket a jellemzőket és tulajdonságokat kell akkor is figyelembe venni, ha a tapasztalatok szigorúbb hozzárendeléshez vezetnek.

**2.1.3.2**      Azokat az anyagokat, amelyek nincsenek a 3.2 fejezet „A” táblázatában név szerint feltüntetve és csak egyetlen veszélyt képviselnek, a megfelelő osztályba, az adott osztály 2.2.x.3 bekezdésében felsorolt valamely gyűjtőmegnevezés alá kell besorolni.

**2.1.3.3**      Azokat az oldatokat vagy keverékeket, amelyek valamely, a 3.2 fejezet „A” táblázatában név szerint felsorolt veszélyes anyagot egy vagy több nem veszélyes anyaggal együtt tartalmazznak, mint a név szerint felsorolt veszélyes anyagokat kell tekinteni, kivéve, ha:

- a) az oldat vagy keverék név szerint fel van sorolva a 3.2 fejezet „A” táblázatában; vagy
- b) a veszélyes anyagra vonatkozó tételből egyértelműen kitűnik, hogy az csak a tiszta, vagy a technikailag tiszta anyagra alkalmazható; vagy
- c) az oldat vagy keverék osztálya, fizikai állapota vagy csomagolási csoportja különbözik a veszélyes anyagétól.

Az előző b) vagy c) bekezdésben hivatkozott esetekben az oldatot vagy a keveréket, a megfelelő osztályban név szerint nem említett anyagként, az adott osztály 2.2.x.3 bekezdésében felsorolt valamely gyűjtőmegnevezés alá kell besorolni, figyelembe véve az oldat vagy keverék által esetleg képviselt járulékos veszély(eke)t. Ha azonban az oldat vagy a keverék egyik osztály kritériumaival sem rendelkezik, akkor nem tartozik a RID hatálya alá.

**2.1.3.4**      A 2.1.3.4.1 és a 2.1.3.4.2 pontban említett tételek bármelyikének anyagát tartalmazó oldatokat és keverékeket e pontok előírásai szerint kell besorolni.

**2.1.3.4.1**      A következő, név szerint feltüntetett anyagok bármelyikét tartalmazó oldatokat és keverékeket ugyanazon tétel alá kell besorolni, mint ahová maga az anyag tartozik, kivéve, ha a 2.1.3.5.3 pontban említett tulajdonságokkal rendelkeznek:

– 3 osztály

UN 1921 PROPILÉN-IMIN, STABILIZÁLT;

UN 2481 ETIL-IZOCIANÁT;

UN 3064 NITROGLICERIN ALKOHOLOS OLDATBAN, 1%-nál több, de legfeljebb 5% nitroglicerinnel tartalommal

– 6.1 osztály

UN 1051 HIDROGÉN-CIANID, STABILIZÁLT, 3%-nál kevesebb víztartalommal;

UN 1185 ETILÉN-IMIN, STABILIZÁLT;

UN 1259 NIKKEL-TETRAKARBONIL;

UN 1613 HIDROGÉN-CIANID VIZES OLDAT (CIÁN-HIDROGÉNSAV VIZES OLDAT) legfeljebb 20% hidrogén-cianid tartalommal;

UN 1614 HIDROGÉN-CIANID, STABILIZÁLT, 3%-nál kevesebb víztartalommal és inert porózus anyagban abszorbeálva;  
UN 1994 VAS-PENTAKARBONIL;  
UN 2480 METIL-IZOCIANÁT;  
UN 3294 HIDROGÉN-CIANID ALKOHOLOS OLDAT legfeljebb 45% hidrogén-cianid tartalommal

– 8 osztály

UN 1052 HIDROGÉN-FLUORID, VÍZMENTES;  
UN 1744 BRÓM vagy UN 1744 BRÓM OLDAT;  
UN 1790 FLUOR-HIDROGÉNSAV 85%-nál több hidrogén-fluorid tartalommal;  
UN 2576 OLVASZTOTT FOSZFOR-OXI-BROMID

#### **2.1.3.4.2** A 9 osztályba tartozó

UN 2315 FOLYÉKONY POLIKLÓROZOTT BIFENILEK;  
UN 3151 FOLYÉKONY POLIHALOGÉNEZETT BIFENILEK;  
UN 3151 FOLYÉKONY POLIHALOGÉNEZETT TERFENILEK;  
UN 3152 SZILÁRD POLIHALOGÉNEZETT BIFENILEK  
UN 3152 SZILÁRD POLIHALOGÉNEZETT TERFENILEK; vagy  
UN 3432 SZILÁRD POLIKLÓROZOTT BIFENILEK

tételek bármelyikének anyagát tartalmazó oldatokat és keverékeket mindig a 9 osztály ugyanazon tétele alá kell besorolni, amennyiben:

- a 3, a 4.1, a 4.2, a 4.3, az 5.1, a 6.1, ill. a 8 osztály III csomagolási csoportjaiba tartozó anyagokon kívül további veszélyes alkotórészt nem tartalmaznak; és
- nem rendelkeznek a 2.1.3.5.3 pontban említett veszélyes tulajdonságokkal.

**2.1.3.5** Azokat az anyagokat, amelyek a 3.2 fejezet „A” táblázatában nincsenek név szerint feltüntetve, de egynél több veszélyes tulajdonsággal rendelkeznek, valamint azokat az oldatokat és keverékeket, amelyekben többféle veszélyes anyag van, a veszélyes tulajdonságaik alapján a megfelelő osztályba, valamely gyűjtőmegnevezéshez (lásd a 2.1.2.4 bekezdést) és csomagolási csoporthoz kell sorolni. A veszélyes tulajdonságokon alapuló besorolást a következő módon kell végrehajtani:

**2.1.3.5.1** A fizikai, kémiai jellemzőket és a fiziológiai tulajdonságokat méréssel vagy számítással kell meghatározni, az anyagot, oldatot vagy keveréket az egyes osztályok 2.2.x.1 bekezdésében meghatározott kritériumok szerint kell besorolni.

**2.1.3.5.2** Amennyiben ez a meghatározás aránytalanul nagy költséggel és munkaráfordítással járna (pl. bizonyos hulladékoknál), akkor az oldatokat és keverékeket a döntő veszélyt képviselő összetevő osztályába kell besorolni.

**2.1.3.5.3** Ha egy anyag, oldat vagy keverék veszélyességi jellemzője a következőkben felsorolt osztályok vagy anyagcsoportok közül egynél többnek is megfelel, akkor ezt az anyagot, oldatot vagy keveréket a döntő veszélynek megfelelő osztályba vagy anyagcsoportba kell besorolni, a következő elsőbbségi sorrend alapján:

- a) a 7 osztály anyagai (kivéve a radioaktív anyagokat engedményes küldemény-darabokban, ahol az egyéb veszélyességi tulajdonságok elsőbbséget élveznek);
- b) az 1 osztály anyagai;
- c) a 2 osztály anyagai;
- d) a 3 osztály érzéketlenített, folyékony robbanóanyagai;

- e) a 4.1 osztály önreaktív anyagai és érzéketlenített, szilárd robbanóanyagai;
- f) a 4.2 osztály piroforos anyagai;
- g) az 5.2 osztály anyagai;
- h) a 6.1 vagy a 3 osztály anyagai, amelyek belélegzési mérgezőképességük alapján az I csomagolási csoportba vannak sorolva [A 8 osztályba sorolás kritériumait kielégítő anyagokat, amennyiben por és köd belélegzési mérgezőképességük ( $LC_{50}$ ) az I csomagolási csoport tartományába esik, de lenyelés vagy bőrön át való felszívódás esetén a mérgezőképességük csak a III csomagolási csoport tartományába esik vagy annál kevésbé mérgezőek, a 8 osztályba kell sorolni.];
- i) a 6.2 osztály fertőző anyagai.

**2.1.3.5.4** Ha egy anyag veszélyes tulajdonságai az előző 2.1.3.5.3 pontban fel nem sorolt több osztályhoz vagy anyagcsoporthoz tartoznak, az anyagot ugyanilyen eljárással kell besorolni, de a megfelelő osztályt a 2.1.3.10 bekezdésben levő, a veszélyességi rangsort tartalmazó táblázat alapján kell megválasztani.

**2.1.3.5.5** Ha a szállítandó anyag olyan hulladék, melynek pontos összetétele nem ismert, a 2.1.3.5.2 pont szerint az UN tételhez és csomagolási csoporthoz való hozzárendelését a feladó ismeretei alapján rendelkezésre álló adatok (beleértve a hatályos biztonsági és környezetvédelmi jogszabályok<sup>1)</sup> által megkövetelt biztonsági és műszaki adatokat) alapján is el lehet végezni.

Kétség esetén a legnagyobb veszélyességi szintet kell alkalmazni.

Amennyiben a hulladék összetételére vonatkozó ismeretek és az azonosított összetevők fizikai és kémiai tulajdonságai alapján bizonyítható, hogy a hulladék tulajdonságai nem felelnek meg az I csomagolási csoportba való soroláshoz szükséges tulajdonságoknak, a hulladékot további vizsgálat nélkül a II csomagolási csoportba lehet sorolni, a legalkalmasabb m.n.n. tételen belül.

Ez az eljárás nem alkalmazható azokra a hulladékokra, amelyek a 2.1.3.5.3 pont alatt említett anyagokat, vagy a 4.3 osztály anyagait, vagy a 2.1.3.7 bekezdésben említett esetben szereplő anyagokat, vagy olyan anyagokat tartalmaznak, amelyek a 2.2.x.2 bekezdések szerint a szállításhoz ki vannak zárva.

**2.1.3.6** Mindig a legjellegzetesebb, ráillő gyűjtőmegnevezést (lásd a 2.1.2.4 bekezdést) kell használni, azaz általános m.n.n. tétel csak akkor használható, ha generikus tétel vagy speciális m.n.n. tétel nem használható.

**2.1.3.7** A gyűjtő hatású anyagok oldatai és keverékei, ill. a járulékos gyűjtőhatással bíró anyagok robbanásveszélyesek is lehetnek. Ebben az esetben csak akkor szállíthatók, ha megfelelnek az 1 osztály feltételeinek.

**2.1.3.8** Az UN 3077 és az UN 3082 tétel alá soroltak kivételével azokat az 1 – 9 osztályba tartozó anyagokat, amelyek megfelelnek a 2.2.9.1.10 pont kritériumainak, az 1 – 9 osztályra

---

1) Ilyen jogszabályok például: a Bizottság 2000/532/EK határozata (2000. május 3.) a hulladékjegyzéknek a hulladékokról szóló 75/442/EGK tanácsi irányelv [felváltotta a 2006/12/EK parlamenti és tanácsi irányelv (az EK Hivatalos Lapja L 114 szám, 2006. 04. 27., 9. oldal)] 1. cikkének a) pontja értelmében történő meghatározásáról szóló 94/3/EK határozat, valamint a veszélyes hulladékok jegyzékének a veszélyes hulladékokról szóló 91/689/EGK tanácsi irányelv 1. cikkének (4) bekezdése értelmében történő meghatározásáról szóló 94/904/EK tanácsi határozat felváltásáról (az EK Hivatalos Lapja, L 226 szám, 2000. 09. 06., 3. o.). Magyarországon lásd még 2000. évi XLIII. tv-t a hulladékgazdálkodásról és a 16/2001. (VII. 18.) KöM rendeletet a hulladékok jegyzékéről.

jellemző veszélyeken túlmenően környezetre veszélyesnek is kell tekinteni. A többi olyan anyagot, amely megfelel a 2.2.9.1.10 pont kritériumainak, az UN 3077, ill. az UN 3082 tétel alá kell sorolni.

**2.1.3.9**

A Veszélyes hulladékok országhatárokat átlépő szállításának ellenőrzéséről és ártalmatlanításáról szóló Bázeli Egyezmény\* hatálya alá tartozó azon hulladékok is szállíthatók az UN 3077, ill. az UN 3082 tétel alatt, amelyek nem felelnek meg az 1 – 9 osztályba sorolás kritériumainak.

---

\* Magyarországon kihirdette a 101/1996.(VII.12.) Korm. rendelet.

8, III																		8, III

Szil. = szilárd anyagok és keverékek

Foly. = folyékony anyagok, oldatok és keverékek

Dermal. = mérgezőképesség bőrön át való felszívódás esetén

Oral. = mérgezőképesség lenyelés esetén

Inhal. = mérgezőképesség belélegzés esetén

\*/ Peszticideknél 6.1 osztály

**Megjegyzés: 1. Példa a táblázat használatára:**

**Egyedi anyag besorolása**

*A besorolandó anyag leírása:*

A 3 osztály II csomagolási csoportjának, valamint a 8 osztály I csomagolási csoportjának kritériumait kielégítő, név szerint nem említett amin.

*Eljárás:*

A 3, II sornak a 8, I oszloppal való keresztezésénél 8, I található. Ezért ezt az ament a 8 osztályba a következők alá kell besorolni:

UN 2734 FOLYÉKONY, MARÓ, GYÚLÉKONY AMINOK, M.N.N. vagy  
UN 2734 FOLYÉKONY, MARÓ, GYÚLÉKONY POLIAMINOK, M.N.N., I csomagolási csoport.

**Keverék besorolása**

*A besorolandó keverék leírása:*

A 3 osztály III csomagolási csoportjába tartozó gyúlékony folyékony anyagból, a 6.1 osztály II csomagolási csoportjába tartozó mérgező anyagból és a 8 osztály I csomagolási csoportjába tartozó maró anyagból álló keverék.

*Eljárás:*

A 3, III sornak a 6.1, II oszloppal való keresztezésénél 6.1, II található.  
A 6.1, II sornak a 8, I oszloppal való keresztezésénél folyadékra 8, I található.

Ezt a közelebbről nem meghatározott keveréket tehát a 8 osztályba, a következő tétel alá kell besorolni: UN 2922 MÉRGEZŐ, MARÓ FOLYÉKONY ANYAG, M.N.N., I csomagolási csoport.

**2. Példák a keverékek és oldatok osztályba és csomagolási csoportba történő besorolására:**

A 6.1 osztály II csomagolási csoportjába tartozó fenolt a 3 osztály II csomagolási csoportjába tartozó benzolban oldva a 3 osztály II csomagolási csoportjába kell besorolni; ezt az oldatot a fenol mérgező volta miatt a 3 osztály II csomagolási csoportjába, az UN 1992 GYÚLÉKONY, MÉRGEZŐ, FOLYÉKONY ANYAG, M.N.N. tétel alá kell besorolni.

A 6.1 osztály II csomagolási csoportjába tartozó nátrium-arsenát és a 8 osztály II csomagolási csoportjába tartozó nátrium-hidroxid szilárd keverékét a 6.1 osztály II csomagolási csoportjába, az UN 3290 MARÓ, SZERVETLEN, MÉRGEZŐ SZILÁRD ANYAG, M.N.N. tétel alá kell besorolni.

A 4.1 osztály III csomagolási csoportjába tartozó nyers vagy finomított naftalint a 3 osztály II csomagolási csoportjába tartozó benzinben oldva a 3 osztály II csomagolási csoportjába, az UN 3295 FOLYÉKONY SZÉNHIDROGÉNEK, M.N.N. tétel alá kell besorolni.

A 3 osztály III csomagolási csoportjába tartozó szénhidrogének és a 9 osztály II csomagolási csoportjába tartozó poliklórozott bifénilek (PCB-k) keverékeit a 9 osztály II csomagolási csoportjába, az UN 2315 FOLYÉKONY POLIKLÓROZOTT BIFENILEK vagy az UN 3432 SZILÁRD POLIKLÓROZOTT BIFENILEK tétel alá kell besorolni.

A 3 osztályba tartozó propilén-imin és a 9 osztály II csomagolási csoportjába tartozó poliklórozott bifénilek (PCB-k) keverékét a 3 osztályba, az UN 1921 PROPILÉN-IMIN, STABILIZÁLT tétel alá kell besorolni.

## **2.1.4            Minták besorolása**

**2.1.4.1**            Amennyiben egy anyag osztálya bizonytalan, ezért további vizsgálat céljából szállítják, akkor ideiglenes osztályt, helyes szállítási megnevezést és UN számot kell hozzárendelni a feladónak az anyagra vonatkozó ismeretei és

- a)    a 2.2 fejezet osztályozási kritériumai; és
- b)    e fejezet előírásai alapján.

A választott helyes szállítási megnevezéshez tartozó legszigorúbb csomagolási csoportot kell alkalmazni.

Ha ezt az előírást használjuk, a helyes szállítási megnevezést ki kell egészíteni a „minta” szóval (pl. UN 1993 gyúlékony folyékony anyag, m.n.n., minta). Abban az esetben, ha egy bizonyos besorolási kritériumoknak megfelelő anyagmintára létezik speciális helyes szállítási megnevezés (pl. UN 3167 túlnyomás nélküli, gyúlékony gázminta, m.n.n.), akkor ezt kell használni. Ha a minta szállításához m.n.n. tételt használnak, a helyes szállítási megnevezést nem kell kiegészíteni a műszaki megnevezéssel, amint azt a 3.3 fejezet 274 különleges előírása megköveteli.

**2.1.4.2**            Az anyag mintákat az ideiglenesen hozzárendelt helyes szállítási megnevezéshez tartozó előírások szerint kell szállítani, amennyiben:

- a)    az anyag nem tekinthető a 2.2 fejezet 2.2.x.2 bekezdései vagy a 3.2 fejezet alapján a fuvarozásból kizárt anyagnak;
- b)    az anyag nem tekinthető az 1 osztály kritériumait kielégítő anyagnak, ill. fertőző vagy radioaktív anyagnak;
- c)    ha az anyag önreaktív anyag, illetve szerves peroxid, akkor megfelel a 2.2.41.1.15 pont, ill. a 2.2.52.1.9 pont előírásainak;
- d)    az anyagot kombinált csomagolásban szállítják, és a nettó tömege nem haladja meg a 2,5 kg-ot küldeménydarabonként;

a minta nincs más áruval egybecsomagolva.

## 2.2 fejezet

### Az egyes osztályokra vonatkozó előírások

#### 2.2.1 1 osztály Robbanóanyagok és -tárgyak

##### 2.2.1.1 *Kritériumok*

##### 2.2.1.1.1 Az 1 osztály fogalmkörébe tartozó anyagok:

- a) *Robbanóanyagok:* szilárd vagy folyékony halmazállapotú anyagok vagy keverékek, amelyek kémiai reakció révén képesek arra, hogy olyan sebességgel fejlesszenek gázt, ami elegendő hőmérsékletű és akkora nyomáshullámot hoz létre, hogy a környezetében károsodást idéz elő.

*Pirotechnikai anyagok:* anyagok vagy keverékek, amelyeknek az a rendeltetése, hogy robbanás nélküli, önfenntartó exoterm kémiai reakció révén hőt fejlesszenek, fényt keltsenek, hanghatást váltsanak ki, gázt vagy füstöt fejlesszenek, vagy e hatások valamilyen kombinációját fejtsék ki.

**Megjegyzés:** 1. Azok az anyagok, amelyek önmagukban véve nem robbanóanyagok, de amelyek robbanásveszélyes gáz-, gőz- vagy porkeverékeket képezhetnek, nem tartoznak az 1 osztály anyagai közé.

2. Szintén nem tartoznak az 1 osztályba azok a víz- és alkoholtartalmú robbanóanyagok, amelyek víz-, ill. alkoholtartalma a megadott határértékeket meghaladja és azok, amelyek plasztifikáló anyagot tartalmaznak – ezek a robbanóanyagok a 3 vagy a 4.1 osztályba vannak besorolva –, valamint azok a robbanóanyagok, amelyek a bennük rejlő alapvető veszély miatt az 5.2 osztályba vannak besorolva.

- b) *Robbanótárgyak:* olyan tárgyak, amelyek egy vagy több robbanóanyagot vagy pirotechnikai anyagokat tartalmaznak.

**Megjegyzés:** Nem tartoznak az 1 osztály előírásainak hatálya alá azok a szerkezetek, amelyek olyan jellegű vagy olyan kis mennyiségű robbanó vagy pirotechnikai anyagokat tartalmaznak, amelyek szállítás közbeni véletlenszerű vagy gondatlanság miatt bekövetkező meggyulladás vagy beindulása csak olyan reakciót idéz elő, amely nem jár kívülről észlelhető repeszhatással, tűzzel, köd-, füst- vagy hőfejlődéssel vagy erős hanghatással.

- c) Azok az előzőekben nem említett anyagok és tárgyak, amelyek arra a célra készültek, hogy gyakorlati hatásukat robbanás vagy pirotechnikai jelenség formájában fejtsék ki.

##### 2.2.1.1.2 Minden anyagot vagy tárgyat, amelynek robbanó tulajdonsága van vagy robbanó tulajdonsága lehet, az 1 osztályba való besorolás szempontjából meg kell vizsgálni a „Vizsgálatok és kritériumok kézikönyv” I. Részében meghatározott vizsgálatok, próbák és kritériumok szerint.

Az 1 osztályba sorolt valamely anyag vagy tárgy csak akkor fuvarozható, ha a 3.2 fejezet „A” táblázatában található valamely megnevezéshez vagy m.n.n. tételhez hozzá lett rendelve, és a „Vizsgálatok és kritériumok kézikönyv” feltételeinek megfelelően.

##### 2.2.1.1.3 Az 1 osztály anyagait és tárgyait a 3.2 fejezet „A” táblázata szerint valamely UN szám és megnevezés vagy m.n.n. tétel alá kell besorolni. A 3.2 fejezet „A” táblázatában található megnevezésének értelmezése a 2.2.1.1.8 pontban található szójegyzéken alapul.

Az új vagy már régebben létező robbanóanyagok vagy robbanótárgyak mintái – az indító robbanóanyagok kivételével –, amelyeket többek között kísérleti, besorolási, kutatási és fejlesztési vagy minőségellenőrzési célból, vagy mint kereskedelmi mintát szállítanak, az „UN 0190 ROBBANÓANYAG MINTA” tételhez is besorolhatók.

A 3.2 fejezet „A” táblázatában név szerint nem említett robbanóanyagoknak és -tárgyaknak az 1 osztály valamely m.n.n. tételéhez vagy az „UN 0190 ROBBANÓANYAG MINTA” tételéhez való hozzárendelését, valamint bizonyos meghatározott anyagok besorolását, amelyek fuvarozása a 3.2 fejezet „A” táblázat 6 oszlopában szereplő különleges előírás alapján az illetékes hatóság külön engedélyéhez van kötve, a származási ország illetékes hatóságának kell elvégeznie. Ezen anyagok és tárgyak szállítási feltételeit szintén írásban kell az illetékes hatóságnak engedélyeznie. Ha a származási ország nem valamely COTIF Tagállam, akkor a besorolást és a szállítási feltételeket a küldemény által érintett első COTIF Tagállam illetékes hatóságának kell elismernie.

**2.2.1.1.4** Az 1 osztály anyagait és tárgyait a 2.2.1.1.5 pont szerinti valamelyik alosztályhoz és a 2.2.1.1.6 pont szerinti valamelyik összeférhetőségi csoporthoz kell hozzárendelni. Az alosztályt a 2.3.0 és 2.3.1 szakaszban leírt vizsgálatok eredményei alapján kell meghatározni, felhasználva a 2.2.1.1.5 pont definícióit. Az összeférhetőségi csoportot a 2.2.1.1.6 pont definíciói alapján kell meghatározni. Az alosztály sorszáma és az összeférhetőségi csoport betűjele együtt alkotják az osztályozási kódot.

**2.2.1.1.5** *Az alosztályok meghatározása*

- 1.1 alosztály Olyan anyagok és tárgyak, amelyeknél fennáll a teljes tömeg felrobbanásának veszélye. (A teljes tömeg felrobbanása olyan robbanás, ami gyakorlatilag egyidejűleg csaknem az egész rakománytömeget érinti.)
- 1.2 alosztály Olyan anyagok és tárgyak, amelyek a kivetés veszélyével járnak, de az egész tömeg felrobbanásának veszélyével nem.
- 1.3 alosztály Olyan anyagok és tárgyak, amelyek tűzveszélyesek és robbanás vagy kivetés vagy ezek együttes fellépésének csekély veszélyével járnak, de az egész mennyiség felrobbanásának veszélye nélkül,
  - a) így azok az anyagok, amelyek égése jelentős sugárzó hőt eredményez; vagy
  - b) amelyek egymásután úgy égnek el, hogy csak kismértékű robbanással vagy kivetéssel, vagy ezek egyidejű fellépésével járnak.
- 1.4 alosztály Olyan anyagok és tárgyak, amelyek csak csekély robbanásveszélyt jelentenek szállítás közbeni meggyulladásuk vagy beindulásuk esetén. A hatások lényegében a küldeménydarabra korlátozódnak, és általában nem következik be jelentősebb méretű repeszdarabok keletkezése vagy a repeszdarabok nagyobb távolságra való szétröpülése. Kívülről ható tűz nem vonja maga után a küldeménydarab teljes tartalmának gyakorlatilag azonnali felrobbanását.
- 1.5 alosztály Rendkívül kis mértékben érzékeny, tömegrobbanás veszélyét magukba rejtő anyagok, amelyek érzéketlensége olyan, hogy normális szállítási körülmények között beindulásuk vagy égésük robbanásba való átmenetének valószínűsége rendkívül csekély. Minimális követelmény ezen anyagokra nézve, hogy a külső tűz hatásának vizsgálata során nem szabad felrobbanniuk.
- 1.6 alosztály Rendkívül érzéketlen tárgyak, amelyeknél nem áll fenn a teljes tömeg felrobbanásának veszélye. Az ilyen tárgyak csak rendkívül érzéketlen robbanóanyagokat tartalmaznak, és bizonyítottan elhanyagolható a véletlen iniciálásuk vagy beindulásuk valószínűsége.

**Megjegyzés:** Az 1.6 alosztály tárgyaitól kiinduló veszély egyetlen tárgy felrobbanására korlátozódik.

**2.2.1.1.6**

*Az anyagok és tárgyak összeférhetőségi csoportjainak meghatározása*

- A Primer robbanóanyag.
- B Primer robbanóanyaggal töltött tárgy kettőnél kevesebb hatékony biztonsági szerkezettel. Egyes tárgyak, így a detonátorok robbantáshoz, detonátor-szerkezetek robbantáshoz és gyutacsszelencék ide tartoznak, bár ezek nem tartalmaznak primer robbanóanyagot.
- C Tolóhatású robbanóanyag vagy egyéb másodlagos deflagráló robbanóanyag vagy ilyen robbanóanyaggal töltött tárgy.
- D Szekunder detonáló robbanóanyag vagy feketelőpor vagy szekunder detonáló robbanóanyagot tartalmazó tárgy, minden esetben gyújtóeszköz és hajtótöltet nélkül, vagy primer robbanóanyagot tartalmazó tárgy legalább két hatékony biztonsági szerkezettel.
- E Szekunder detonáló robbanóanyagot tartalmazó tárgy indítószerkezet nélkül, de hajtótöltettel (gyúlékony folyadékot, gél vagy hipergolokat tartalmazó töltetek kivételével).
- F Szekunder detonáló robbanóanyagot tartalmazó tárgy saját indítószerkezettel, hajtótöltettel (gyúlékony folyadékot, gél vagy hipergolokat tartalmazó töltetek kivételével) vagy hajtótöltet nélkül.
- G Pirotechnikai anyag vagy pirotechnikai anyagot tartalmazó tárgy vagy olyan tárgy, amely egyben robbanóanyagot és gyújtó-, világító-, könnyfakasztó- vagy ködképző-anyagot is tartalmaz (a vízzel aktiválható tárgyak, valamint a fehérfoszfort, foszfidokat, piroforos anyagot, gyúlékony folyadékot, gél vagy hipergolokat tartalmazó tárgyak kivételével).
- H Robbanóanyagot és fehérfoszfort együtt tartalmazó tárgy.
- J Robbanóanyagot és gyúlékony folyadékot vagy gél együtt tartalmazó tárgy.
- K Robbanóanyagot és mérgező vegyianyagot együtt tartalmazó tárgy.
- L Olyan robbanóanyag vagy robbanóanyagot tartalmazó tárgy, amely különleges kockázattal jár (pl. víz hatására történő aktiválódás miatt vagy hipergolok, foszfidok vagy piroforos anyag jelenléte miatt) és így minden egyes típus elkülönítése szükséges.
- N Csak rendkívül érzéketlen robbanóanyagokat tartalmazó tárgyak.
- S Olyan anyag vagy tárgy, amely úgy van csomagolva vagy kialakítva, hogy a nem szándékos reakció révén bekövetkező minden hatás a küldeménydarab belsejére korlátozódik, kivéve, ha tűz esetén maga a küldeménydarab károsodik. Ebben az esetben a robbanási és kivetési hatásoknak olyan mértékűre kell korlátozódniuk, hogy ne akadályozzák a tűz leküzdését vagy más rendkívüli intézkedések végrehajtását a küldeménydarab közvetlen közelében.

**Megjegyzés:** 1. Valamely anyag vagy tárgy meghatározott csomagolásban csak egyetlen összeférhetőségi csoportba sorolható. Mivel az S összeférhetőségi csoport feltételei tapasztalati jellegűek, az ezen csoportba való sorolás szükségszerűen valamely osztályozási kód hozzárendelésére szolgáló próbához kötött.

- 2. A D és az E összeférhetőségi csoportok tárgyait el lehet látni, vagy egybe lehet csomagolni saját gyújtószerkezetiükkel azzal a feltétellel, hogy ezeknek az eszközöknek legalább két olyan hatásos biztonsági szerkezetük van, amelyek megakadályozzák a robbanás bekövetkeztét a gyújtószerkezet nem szándékos aktiválódása esetén. Az ilyen küldeménydarabok a D vagy az E

össze férhetőségi csoportba tartoznak.

3. A D és az E összeférhetőségi csoportok tárgyait egybe lehet csomagolni olyan saját indítószervezetükkel, amelyeknek nincs két hatásos biztonsági szerkezetük (azaz olyan indítószervezetek, amelyek a B összeférhetőségi csoportba tartoznak), feltéve, hogy a 4.1.10 szakasz MP21 egybecsomagolási előírásainak megfelelnek. Az ilyen küldeménydarabok a D vagy az E összeférhetőségi csoportba tartoznak.
4. A tárgyakat el lehet látni vagy egybe lehet csomagolni saját gyújtószervezetükkel, feltéve, hogy a gyújtószervezetek normális szállítási körülmények között nem tudnak működésbe lépni.
5. A C, a D és az E összeférhetőségi csoportba tartozó tárgyakat egybe lehet csomagolni. Az ilyen küldeménydarabokat az E összeférhetőségi csoporthoz kell hozzárendelni.

**2.2.1.1.7** A tűzijáték testek alosztályba sorolása

**2.2.1.1.7.1** A tűzijáték testeket rendes körülmények között a „Vizsgálatok és kritériumok kézikönyv” I. Rész 16. fejezet 6. vizsgálati sorozat próbái során nyert adatok alapján kell az 1.1, az 1.2, az 1.3 vagy az 1.4 alosztályba sorolni. Mivel azonban ezeknek a termékeknek a választéka rendkívül nagy, viszont a vizsgáló berendezések korlátozottan állnak rendelkezésre, az alosztályt a 2.2.1.1.7.2 pontban ismertetett eljárással is meg lehet határozni.

**2.2.1.1.7.2** A tűzijáték testeket az UN 0333, az UN 0334, az UN 0335 és az UN 0336 tételek alá a 6 vizsgálati sorozat próbáinak elvégzése nélkül, hasonlóság alapján is be lehet sorolni, a 2.2.1.1.7.5 pontban található, „tűzijáték testek vizsgálat hiányában történő besorolásának táblázata” szerint, az illetékes hatóság egyetértése esetén. A táblázatban nem szereplő tételeket a 6 vizsgálati sorozat próbái során nyert adatok alapján kell besorolni.

**Megjegyzés:** 1. A 2.2.1.1.7.5 pont táblázatának első oszlopát csak akkor lehet más típusú tűzijáték testtel kiegészíteni, ha a teljes vizsgálat eredményeit már benyújtották az ENSZ Veszélyes áru szállítási szakértő albizottságnak (UN Sub-Committee of Experts on the Transport of Dangerous Goods).

2. Ha a 2.2.1.1.7.5 pont táblázatának negyedik oszlopában meghatározott tűzijáték testekre vonatkozóan valamely illetékes hatóságtól származó vizsgálati eredmények megerősítik a 2.2.1.1.7.5 pont táblázatának ötödik oszlopában szereplő besorolást vagy annak ellentmondanak, erről az ENSZ Veszélyes áru szállítási szakértő albizottságát (UN Sub-Committee of Experts on the Transport of Dangerous Goods) értesíteni kell.

**2.2.1.1.7.3** Ha különböző alosztályokba tartozó tűzijáték testeket csomagolnak egy küldeménydarabba, azt a küldeménydarabban levő legveszélyesebb alosztály alapján kell besorolni, kivéve, ha a 6 vizsgálati sorozat próbái más eredményre vezetnek.

**2.2.1.1.7.4** A 2.2.1.1.7.5 pont táblázatában lévő besorolás csak olyan tárgyakra érvényes, amelyek (4G kódjelű) papírlemez ládában vannak.

**2.2.1.1.7.5** *Tűzijáték testek vizsgálat hiányában történő besorolásának táblázata<sup>2)</sup>*

**Megjegyzés:** 1. Ellentétes meghatározás hiányában a táblázatban a százalékra történő hivatkozás az összes pirotechnikai elegy tömegére vonatkozik (pl. rakéta motorok, lökő töltet, bontó töltet és effekt anyag).

2. A „villanó elegy” a táblázatban olyan pirotechnikai elegyre utal, amely a tűzijáték testben por formában vagy töltetegységként van jelen, és amelyet levegőben durranó effekt keltéséhez, bontó töltethez vagy lökőtöltethez használnak, kivéve, ha a „Vizsgálatok és kritériumok kézikönyv” 2 vizsgálati sorozat 2 c) i) „Idő/nyomás” próbája során a nyomás-növekedéshez szükséges idő 0,5 g pirotechnikai elegy esetén 8 ms-nál több.
3. A mm-ben kifejezett méretek a következőket jelentik:
- gömb és etázs bombáknál a bomba gömbjének átmérője;
  - hengeres bombánál a bombának a hossza;
  - csőben lévő bombánál, római gyertyánál, egylövéses római gyertyánál, vagy mozsárnál a tűzijáték testet tartalmazó cső belső átmérője;
  - hengeres mozsárnál a mozsárhoz használni kívánt cső belső átmérője.

---

2) A táblázat azokat a tűzijáték test besorolásokat tartalmazza, amelyeket a 6 vizsgálati sorozat hiányában is lehet alkalmazni (lásd a 2.2.1.1.7.2 pontot).

Típus	Tartalom/szinonima	Meghatározás	Részletes leírás	Besorolás
Gömb és hengeres alakú tűzijáték bombák	<i>Gömb-bombák:</i> csillagos bombák, nappali bombák, több effektus bombák, vízre ugró bombák, ejtőernyős bombák, füst bombák; <i>durranós/villanós bombák:</i> jelző-, durranó-, fűtőülő-, villanóbombák	Csőből való kilövésre tervezett eszköz lökőtöltettel vagy anélkül, késleltetővel és bontó töltettel, pirotechnikai töltetegységekkel vagy laza pirotechnikai eleggyel	Mindenféle durranós bomba	1.1G
			Csillagos bomba: $\geq 180$ mm	1.1G
			Csillagos bombák: $< 180$ mm, $> 25\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel	1.1G
			Csillagos bombák: $< 180$ mm, $\leq 25\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel	1.3G
			Csillagos bombák: $\leq 50$ mm vagy $\leq 60$ g pirotechnikai eleggyel, $\leq 2\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel	1.4G
	Etázs bombák	Két vagy több gömb-bombából egybe rögzített, azonos lökőtöltettel, de elválasztott külső késleltetővel rendelkező eszköz	A besorolást a legveszélyesebb gömb-bomba határozza meg.	
	Előre töltött csövek, csőben lévő bombák	Kilövésre tervezett, a csőbe előre telepített gömb- vagy hengeres bomba	Mindenféle durranós bomba	1.1G
			Csillagos bombák: $\geq 180$ mm	1.1G
			Csillagos bombák: $> 25\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel	1.1G
			Csillagos bombák: $> 50$ mm és $< 180$ mm	1.2G
			Csillagos bombák: $\leq 50$ mm vagy $\leq 60$ g pirotechnikai eleggyel, $\leq 25\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel	1.3G
	Bombák a bombában (gömb) (a „bombák a bombában” esetén a százalékra történő hivatkozás a tűzijáték test teljes tömegére vonatkozik)	Csőből való kilövésre tervezett eszköz lökőtöltet nélkül, késleltetővel és bontó töltettel, amely durranós bombákat és inert anyagokat tartalmaz	$> 120$ mm	1.1G
		Csőből való kilövésre tervezett eszköz lökőtöltet nélkül, késleltetővel és bontó töltettel, amely töltetegységenként $\leq 25$ g villanó elegyet tartalmazó durranós bombákat tartalmaz, valamint $\leq 33\%$ villanó elegyet és $\geq 60\%$ inert anyagot	$\leq 120$ mm	1.3G
		Csőből való kilövésre tervezett eszköz lökőtöltet nélkül, késleltetővel és bontó töltettel, amely csillagos bombákat és/vagy pirotechnikai töltetegységeket tartalmaz	$> 300$ mm	1.1G

Típus	Tartalom/szinonima	Meghatározás	Részletes leírás	Besorolás
		Csőből való kilövésre tervezett eszköz lökőtöltet nélkül, késleltetővel és bontó töltettel, amely $\leq 70$ mm csillagos bombákat és/vagy pirotechnikai töltetegységeket tartalmaz, valamint $\leq 25\%$ villanó elegyet és $\leq 60\%$ pirotechnikai elegyet	$> 200$ mm és $\leq 300$ mm	1.3G
		Csőből való kilövésre tervezett eszköz lökőtöltettel, késleltetővel és bontó töltettel, amely $\leq 70$ mm csillagos bombákat és/vagy pirotechnikai töltetegységeket tartalmaz, valamint $\leq 25\%$ villanó elegyet és $\leq 60\%$ pirotechnikai elegyet	$\leq 200$ mm	1.3G
Telepek/ Kombinációk	Telepek, finálé telepek, bombetta telepek	Több, megszerelt elem, amely egyforma vagy különböző, de az ebben a táblázatban felsorolt valamely tűzijáték testnek megfelelő típusú tűzijáték testet tartalmaz, egy vagy két indítási ponttal	A besorolást a legveszélyesebb tűzijáték test típus határozza meg.	
Római gyertyák	Római gyertyák	Olyan pirotechnikai töltetegységek sorozatát tartalmazó cső, amelyek változó pirotechnikai effekteket, lökőtölteteket és késleltetőket tartalmaznak	$\geq 50$ mm belső átmérővel, villanó eleggyel, vagy $< 50$ mm belső átmérővel és $> 25\%$ villanó eleggyel	1.1G
			$\geq 50$ mm belső átmérővel, villanó elegy nélkül	1.2G
			$< 50$ mm belső átmérővel és $\leq 25\%$ villanó eleggyel	1.3G
			$\leq 30$ mm belső átmérővel, minden pirotechnikai töltetegység $\leq 25$ g és $\leq 5\%$ villanó eleggyel	1.4G
Egylövéses római gyertyák	Egylövéses római gyertyák, kis, előre töltött csövek	Olyan pirotechnikai töltetegységet tartalmazó cső, amely pirotechnikai effektet, lökőtöltetet tartalmaz, késleltetővel vagy anélkül	$\leq 30$ mm belső átmérővel és $> 25$ g pirotechnikai töltetegységgel vagy $> 5\%$ és $\leq 25\%$ villanó eleggyel	1.3G
			$\leq 30$ mm belső átmérővel, $\leq 25$ g pirotechnikai töltetegységgel és $\leq 5\%$ villanó eleggyel	1.4G
Rakéták	Jelző rakéták, fűtyülő rakéták, nem pálcás rakéták	Levegőben való repülésre tervezett, pirotechnikai elegyet és/vagy pirotechnikai töltetegységet tartalmazó cső, vezető pálcával/pálcákkal vagy más, repülés stabilizáló eszközzel felszerelve	Csak villanó elegy tartalommal	1.1G
			A pirotechnikai elegy tartalomtól a villanó elegy tartalom $> 25\%$	1.1G
			$> 20$ g pirotechnikai elegy tartalommal és $\leq 25\%$ villanó elegy tartalommal	1.3G
			$\leq 20$ g pirotechnikai elegy tartalommal, fekete löpor bontó töltettel és durranó betétenként $\leq 0,13$ g, de összesen $\leq 1$ g villanó eleggyel	1.4G

Típus	Tartalom/szinonima	Meghatározás	Részletes leírás	Besorolás
Tűzijáték mozsár	Tűzijáték mozsár, cső nélküli mozsár	Földre való állításra vagy földbe való rögzítésre tervezett, lökőtöltetet és pirotechnikai töltetegységet tartalmazó cső. A fő effekt az összes pirotechnikai töltetegység egy kifújásban való kilövése által a levegőben nagymértékben szétterjedő vizuális és/vagy hang effekt létrehozása; vagy: Vetőcsőben való elhelyezésre és mozsárként való működésre tervezett, szövet vagy papír zacskó, ill. szövet vagy papír henger, ami lökőtöltetet és pirotechnikai töltetegységeket tartalmaz.	> 25% laza por formájú villanó eleggyel és/vagy durranó effekttel	1.1G
			$\geq 180$ mm, $\leq 25\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel	1.1G
			$< 180$ mm, $\leq 25\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel	1.3G
			$\leq 150$ g pirotechnikai elegy $\leq 5\%$ laza por formájú villanó eleggyel és/vagy durranó effekttel. Minden töltetegység $\leq 25$ g, minden durranó effekt $< 2$ g; minden fűtőülő, ha van $\leq 3$ g	1.4G
Szikraszökőkút	Vulkánok, szikraszóró petárdák, vízesés, bengálégők, bengáli tüzek, hengeres szikraszökőkutak, világító/színes fáklyák	Nem fém burkolatú, préselt vagy szilárd, szikrát vagy lángot produkáló pirotechnikai elegyet tartalmazó eszköz	$\geq 1$ kg pirotechnikai eleggyel	1.3G
			$< 1$ kg pirotechnikai eleggyel	1.4G
Csillagszóró	Kézi csillagszóró, nem kézi csillagszóró	Merev drót részlegesen (az egyik végén) bevonva lassan égő pirotechnikai eleggyel, gyújtó véggel vagy anélkül	Perklorát alapú csillagszóró: darabonként $> 5$ g vagy csomagonként $> 10$ darab	1.3G
			Perklorát alapú csillagszóró: darabonként $\leq 5$ g és csomagonként $\leq 10$ darab; Nitrát alapú csillagszóró: darabonként $\leq 30$ g	1.4G
Bengálgyufa	Bengálfáklya, vihargyufa	Kézben való tartásra tervezett, nem fém rúd részlegesen (az egyik végén) bevonva lassan égő pirotechnikai eleggyel	Perklorát alapú eszköz: darabonként $> 5$ g vagy csomagonként $> 10$ darab	1.3G
			Perklorát alapú eszköz: darabonként $\leq 5$ g és csomagonként $\leq 10$ darab; Nitrát alapú eszköz: darabonként $\leq 30$ g	1.4G
Kis veszélyességű tűzijáték testek és újdonságok	Asztali bombák, recsegő szemcsék, füstök, ködök, pirotechnikai szerpentinek (angolul: party poppers), durranó egérkék (angolul: throwdowns, snaps)	Nagyon korlátozott látvány és hang kibocsátásra tervezett eszközök, amelyek kis mennyiségben tartalmaznak pirotechnikai elegyet és/vagy robbanó összetevőt	A „throwdowns” és a „snaps” tartalmazhat legfeljebb 1,6 mg ezüst fulminátot; A „snaps” és a „party poppers” tartalmazhat legfeljebb 16 mg kálium-klorát és vörös foszfor keveréket; A többi eszköz tartalmazhat legfeljebb 5 g pirotechnikai elegyet, de villanóelegyet nem.	1.4G

Típus	Tartalom/szinonima	Meghatározás	Részletes leírás	Besorolás
Forgók	Légi forgók, lepkék, földi forgók	Szikrát vagy gázt termelő pirotechnikai elegyet tartalmazó nem fém cső vagy csövek zajkeltő (fütyülő) eleggyel vagy a nélkül, szárnyakkal vagy szárnyak nélkül	Eszközönként > 20 g pirotechnikai eleggyel, amely ≤ 3% villanó elegyet, mint durranó effektet tartalmaz, vagy ≤ 5 g fütyülő elegyet tartalmaz	1.3G
			Eszközönként ≤ 20 g pirotechnikai eleggyel, amely ≤ 3% villanó elegyet, mint durranó effektet tartalmaz, vagy ≤ 5 g fütyülő elegyet tartalmaz	1.4G
Forgók	Katalin-kerék, szász-kerék	Pirotechnikai elegyet tartalmazó, megszerelt hajtóművek csatlakozó eszközzel úgy felszerelve, hogy el tudjon forogni	≥ 1 kg összes pirotechnikai eleggyel, durranó effekt nélkül, minden fütyülő (ha van) ≤ 25 g és a fütyülő elegy kerekenként ≤ 50 g	1.3G
			< 1 kg összes pirotechnikai eleggyel, durranó effekt nélkül, minden fütyülő (ha van) ≤ 5 g és a fütyülő elegy kerekenként ≤ 10 g	1.4G
Légi forgók	Repülő szász-kerék, UFO-k, korona	Hajtótöltetet és szikrát, lángot termelő és/vagy zajkeltő pirotechnikai elegyeket tartalmazó csövek. A csövek tartó-gyűrűre vannak rögzítve.	Az összes pirotechnikai elegy > 200 g vagy a pirotechnikai elegy hajtóművenként > 60 g, ≤ 3% villanó elegyet, mint durranó effektet tartalmaz, minden fütyülő (ha van) ≤ 25 g és a fütyülő elegy forgónként ≤ 50 g	1.3G
			Az összes pirotechnikai elegy ≤ 200 g és a pirotechnikai elegy hajtóművenként ≤ 60 g, ≤ 3% villanó elegyet, mint durranó effektet tartalmaz minden fütyülő (ha van) ≤ 5 g és a fütyülő elegy forgónként ≤ 10 g	1.4G
Vegyes csomag	Vegyes tűzijátékok	Az ebben a táblázatban felsorolt tűzijáték testeknek megfelelő típusú, többféle tűzijáték testek egy csomagban	A besorolást a legveszélyesebb tűzijáték test típus határozza meg.	
Petárda füzér	Petárda füzér	Megszerelt (papírból vagy kartonpapírból készült) csövek gyújtószállal összekötve, minden cső hangeffekt keltésére szolgál	Minden cső ≤ 140 mg villanó eleggyel vagy ≤ 1 g fekete löporral	1.4G
Petárda	Petárda	Nem fém csőben elhelyezett villanó elegy, amely hangeffekt keltésére szolgál	eszközönként > 2 g villanó eleggyel	1.1G
			eszközönként ≤ 2 g és belső csomagolásonként ≤ 10 g villanó eleggyel	1.3G
			eszközönként ≤ 1 g és belső csomagolásonként ≤ 10 g villanó eleggyel, vagy eszközönként ≤ 10 g fekete löporral	1.4G

**2.2.1.1.8**

*A megnevezések szójegyzéke*

- Megjegyzés:** 1. A szójegyzékben található meghatározások nem helyettesíthetik sem a vizsgálati eljárásokat, sem az 1 osztályba tartozó valamely anyag vagy tárgy veszélyesség szempontjából való osztályozását. A termékeknek a megfelelő alosztályhoz való hozzárendelését és annak eldöntését, hogy az S összeférhetőségi csoporthoz kell-e sorolni, a „Vizsgálatok és kritériumok kézikönyv” I. Része szerint végzett vizsgálat, vagy már megvizsgált és a „Vizsgálatok és kritériumok kézikönyv” eljárása alapján besorolt, hasonló termékek analógiája alapján kell elvégezni.
2. A nevek után álló számok a megfelelő UN számra utalnak (3.2 fejezet „A” táblázat 1 oszlop). Az osztályozási kódra lásd a 2.2.1.1.4 pontot.

**AKNÁK** robbanótöltettel: UN 0136, 0294

Ezek a tárgyak detonáló robbanóanyaggal töltött fém vagy kombinált anyagú tartályból állnak olyan gyújtószerkezettel, amely nincs ellátva két vagy több hatékony biztonsági szerkezettel. A tárgyak arra szolgálnak, hogy hajók, járművek vagy emberek elhaladásakor lépjenek működésbe. Ide tartoznak un. „Bangalori torpedók” is.

**AKNÁK** robbanótöltettel: UN 0137, 0138

Ezek a tárgyak detonáló robbanóanyaggal töltött fém vagy kombinált anyagú tartályból állnak, gyújtószerkezet nélkül vagy olyan gyújtószerkezettel, amely legalább két hatékony biztonsági szerkezettel van ellátva. A tárgyak arra szolgálnak, hogy hajók, járművek vagy emberek elhaladásakor lépjenek működésbe. Ide tartoznak un. „Bangalori torpedók” is.

**A TÍPUSÚ ROBBANTÓANYAG:** UN 0081

Ezek az anyagok folyékony szerves nitrátokat, pl. nitroglicerint vagy ilyen anyagokból álló olyan keveréket tartalmaznak, melyekben a következő alkotórészek közül egy vagy több található: nitrocellulóz; ammónium-nitrát vagy más szervetlen nitrátok; aromás nitrovegyületek vagy éghető anyagok, pl. faliszt vagy alumíniumpor. Ezenkívül tartalmazhatnak inert alkotórészeket, pl. kovaföldet vagy kis mennyiségű adalékanyagokat, pl. színezékeket vagy stabilizátorokat is. A robbantóanyagok porszerű, zselatinszerű vagy elastikus konzisztenciájúak legyenek. Ide tartoznak a dinamitok, a robbanó zselatinok és a plasztikus dinamitok.

**BOMBÁK GYÚLÉKONY FOLYADÉK TARTALOMMAL,** robbanótöltettel: UN 0399, 0400

Ezek olyan tárgyak, amelyeket légi járművekről dobnak le, és gyúlékony folyadékot tartalmazó tartályból és robbanóanyag-töltetből állnak.

**BOMBÁK** robbanótöltettel: UN 0033, 0291

Robbanóanyagot tartalmazó tárgyak, amelyeket légi járművekről dobnak le. Olyan gyújtószerkezetet tartalmaznak, amely nincs ellátva két vagy több hatékony biztonsági szerkezettel.

**BOMBÁK** robbanótöltettel: UN 0034; 0035

Ezek olyan robbanóanyagot tartalmazó tárgyak, amelyeket légi járművekről dobnak le. Vagy nem tartalmaznak gyújtószerkezetet vagy olyan gyújtószerkezetük van, amely legalább két hatékony biztonsági szerkezettel van ellátva.

**BOMBÁK VILLANÓFÉNY TÖLTETTEL:** UN 0037

Ezek olyan, robbanóanyagot tartalmazó tárgyak, amelyeket légi járművekről dobnak le, hogy

rövid ideig ható, intenzív fényforrásul szolgáljanak fényképészeti célokra. Detonáló robbanóanyag-töltetet tartalmaznak olyan gyújtószerkezettel, amely nincs ellátva két vagy több hatékony biztonsági szerkezettel.

**BOMBÁK VILLANÓFÉNY TÖLTETTEL: UN 0038**

Ezek olyan, robbanóanyagot tartalmazó tárgyak, amelyeket légi járművekről dobnak le, hogy rövid ideig ható, intenzív fényforrásul szolgáljanak fényképészeti célokra. Detonáló robbanóanyag-töltetet tartalmaznak gyújtószerkezet nélkül, vagy gyújtószerkezettel, amely legalább két hatékony biztonsági szerkezettel van ellátva.

**BOMBÁK VILLANÓFÉNY TÖLTETTEL: UN 0039, 0299**

Ezek olyan robbanóanyagot tartalmazó tárgyak, amelyeket légi járművekről dobnak le, hogy rövid ideig ható, intenzív fényforrásul szolgáljanak fényképészeti célokra. Villanóanyag-töltetet tartalmaznak.

**B TÍPUSÚ ROBBANTÓANYAG: UN 0082, 0331**

Ezek az anyagok, amelyek vagy

- a) ammónium-nitrát vagy más szervesetlen nitrát robbanóanyagokkal, pl. trinitro-toluollal (TNT-vel), alkotott keverékből állnak, amelyek más anyagokat is, pl. falisztet és alumíniumport is tartalmazhatnak; vagy
- b) ammónium-nitrátból vagy más szervesetlen nitrátból és más éghető, nem robbanó anyagok keverékből állnak.

Mindkét esetben a robbantóanyagok tartalmazhatnak inert alkotórészeket, pl. kovaföldet és kis mennyiségű adalékanyagokat, pl. színezékeket vagy stabilizátorokat. Ezek a robbantóanyagok nem tartalmazhatnak sem nitroglicerint vagy hasonló folyékony szerves nitrátokat, sem pedig klorátokat.

**C TÍPUSÚ ROBBANTÓANYAG: UN 0083**

Ezek az anyagok kálium- vagy nátrium-klorát vagy kálium-, nátrium- vagy ammónium-perklorát és szerves nitrovegyületek vagy éghető anyagok, pl. faliszt, alumíniumpor vagy szénhidrogén keverékből állnak. Ezenkívül inert alkotórészeket, pl. kovaföldet és kis mennyiségű adalékanyagokat, pl. színezékeket vagy stabilizátorokat, is tartalmazhatnak. Ezek a robbantóanyagok nem tartalmazhatnak nitroglicerint vagy hasonló folyékony szerves nitrátokat.

**DETONÁTORSZERKEZETEK, NEMVILLAMOSAK, robbantáshoz: UN 0360, 0361, 0500**

Nemvillamos indítók, amelyek gyújtózsínórral, ütőgyújtóval, robbanózsínórral vagy gyújtócsővel vannak összekötve, és amelyeket ezekkel hoznak működésbe, késleltetővel ellátva, vagy anélkül. Ide értendők a relével szerelt robbanózsínók is.

**D TÍPUSÚ ROBBANTÓANYAG: UN 0084**

Ezek az anyagok szerves nitrovegyületek és éghető anyagok, pl. faliszt, szénhidrogének és -alumíniumpor keverékből állnak. Ezenkívül inert alkotórészeket, pl. kovaföldet és kis mennyiségű adalékanyagokat, pl. színezékeket vagy stabilizátorokat is tartalmazhatnak. Ezek a robbantóanyagok nem tartalmazhatnak sem nitroglicerint vagy hasonló folyékony szerves nitrátokat, sem pedig klorátokat, sem pedig ammónium-nitrátot. Ide tartoznak általában a plasztik robbantóanyagok.

**E TÍPUSÚ ROBBANTÓANYAG: UN 0241, 0332**

Ezek az anyagok vízből mint fő alkotórészből és nagy mennyiségű olyan ammónium-

nitrátból vagy más oxidálószerből állnak, amelyek teljes egészében vagy részben oldott állapotban vannak. A további alkotórészek lehetnek nitrovegyületek, pl. trinitro-toluol, szénhidrogének vagy alumíniumpor. Ezenkívül inert alkotórészeket, pl. kovaföldet és kis mennyiségű adalékanyagokat, pl. színezékeket vagy stabilizátorokat is tartalmazhatnak. Ide tartoznak az emulziós robbantóanyagok, a robbantószuszpenziók és a „vízgél”.

**FEKETE LŐPOR (PUSKAPOR)**, szemcsés vagy por alakú: UN 0027

Ez az anyag faszénből vagy más szénfajtából és kálium-nitrátból vagy nátrium-nitrátból, kénnel vagy anélkül alkotott belsőseges keverék.

**FEKETE LŐPOR (PUSKAPOR), SAJTOLT** vagy  
**FEKETE LŐPOR (PUSKAPOR), PELLETT**: UN 0028

Ez a termék formázott fekete lőporból áll.

**FORMÁZOTT TÖLTETEK** detonátor nélkül: UN 0059, 0439, 0440, 0441

Ezek a tárgyak gyújtószer nélküli detonáló robbanóanyagból álló töltetet tartalmaznak. A robbanóanyag-töltet üreges kialakítású, ami szilárd anyaggal van kitöltve. A tárgyak arra szolgálnak, hogy erős romboló hatást fejtsenek ki.

**FÜSTJELZŐK**: UN 0196, 0197, 0313, 0487, 0507

Ezek a tárgyak pirotechnikai anyagot tartalmaznak, amely füstöt fejleszt. Ezenkívül tartalmazhatnak hallható hang keltésére szolgáló szerkezetet is.

**FÜSTKÉPZŐ LŐSZER, FEHÉRFOSZFOR TARTALMÚ**, robbanó-, kidobó- vagy hajtótöltettel: UN 0245, 0246

Olyan lőszer, amelyek füstképző anyagként fehérfoszfort tartalmaznak. A következő alkotórészekből is tartalmaznak egyet vagy többet: hajtótöltet gyutaccsal és indítótöltettel; gyújtók robbanó- vagy kidobótöltettel. E fogalom ködgránátokat is tartalmaz.

**FÜSTKÉPZŐ LŐSZER**, robbanó-, kidobó- vagy hajtótöltettel vagy anélkül: UN 0015, 0016, 0303

Olyan lőszer, amelyek füstképző anyagokat, pl. klór-szulfonsav keveréket vagy titán-tetrakloridot, vagy hexaklór-etán vagy vörösfoszfor alapú füstképző pirotechnikai keveréket tartalmaznak. Amennyiben a füstképző anyag maga nem robbanóanyag, akkor a lőszer a következő alkotórészekből is tartalmaz egyet vagy többet: hajtótöltet gyutaccsal és gyújtótöltettel; gyújtók robbanó- vagy kidobótöltettel. E fogalom ködgránátokat is tartalmaz.

*Megjegyzés: A FÜSTJELZŐK nem tartoznak ide. Ezek a jelen szójegyzékben külön vannak feltüntetve.*

**FÜST NÉLKÜLI LŐPOR**: UN 0160, 0161

Nitrocellulóz alapon felépített anyag, amelyet lőporként használnak. A fogalom alá tartozik az egybázisú, füst nélküli lőpor [nitrocellulóz (NC) önállóan], a kétbázisú, füst nélküli lőpor [pl. az NC nitroglicerinnel (NG-vel)] és a hárombázisú, füst nélküli lőpor (pl. az NC/NG/nitroguanidin).

*Megjegyzés: Az öntött, sajtolt és töltetzacskóban levő, füst nélküli lőpor a HAJTÓTÖLTETEK vagy a KIDOBÓTÖLTETEK LÖVEGEKHEZ címszó alá tartozik.*

**GOLYÓS PERFORÁTOR TÖLTÉNY OLAJKUTAK FÚRÁSÁHOZ**: UN 0277, 0278

Ezek a tárgyak vékony papírlémezből, fémből vagy más anyagból készített házából állnak és füst nélküli lőport tartalmaznak. Arra valók, hogy edzett lövedéket löjjenek ki és ezzel az

olajfúrólyuk béléscsövét átlukasszák.

*Megjegyzés: A FORMÁZOTT TÖLTETEK nem tartoznak ide. Ezek a jelen szójegyzékben külön szerepelnek.*

**GRÁNÁTOK**, kézi-, vagy fegyvergránátok robbanótöltettel: UN 0284, 0285

Ezek a tárgyak kézből történő hajításra vagy fegyverből való kilövésre szolgálnak. Vagy nem tartalmaznak gyújtószerkezetet, vagy olyan gyújtószerkezetet tartalmaznak, amely legalább két hatékony biztonsági szerkezettel van ellátva.

**GRÁNÁTOK**, kézi-, vagy fegyvergránátok robbanótöltettel: UN 0292, 0293

Ezek a tárgyak kézből történő hajításra vagy fegyverből való kilövésre szolgálnak. Olyan gyújtószerkezetet tartalmaznak, amely nincs ellátva két vagy több hatékony biztonsági szerkezettel.

**GYAKORLÓGRÁNÁTOK**, kézi- vagy fegyvergránátok: UN 0110, 0318, 0372, 0452

Ezek a tárgyak nem tartalmaznak fő robbanótöltetet. Kézből történő hajításra vagy fegyverből való kilövésre szolgálnak. Tartalmaznak gyújtószerkezetet és tartalmazhatnak jelzőtöltetet.

**GYAKORLÓLŐSZER**: UN 0362, 0488

Olyan lőszer, amely nem tartalmaz fő robbanótöltetet, de tartalmaz szétvető- vagy kidobótöltetet. A lőszer rendszerint gyutacsot és hajtótöltetet is tartalmaz.

*Megjegyzés: A GYAKORLÓGRÁNÁTOK nem tartoznak ezen fogalom alá. Ezek a jelen szójegyzékben önállóan szerepelnek.*

**GYÚJTÁSERŐSÍTŐK DETONÁTORRAL**: UN 0225, 0268

A tárgyak detonáló robbanóanyagot és gyújtószert tartalmaznak, és a detonátor vagy robbanózsínór gyújtóimpulzusának erősítésére szolgálnak.

**GYÚJTÁSERŐSÍTŐK** detonátor nélkül: UN 0042, 0283

Ezek a tárgyak gyújtószert nélküli detonáló robbanóanyagot tartalmaznak és a detonátor vagy robbanózsínór gyújtóimpulzusának erősítésére szolgálnak.

**GYÚJTÓK**: UN 0121, 0314, 0315, 0325, 0454

Ezek a tárgyak egy vagy több robbanóanyagot tartalmaznak. Rendeltetésük a robbantó- vagy gyújtóláncban a deflagráció kiváltása. A tárgyak vegyi, villamos vagy mechanikus úton hozhatók működésbe.

*Megjegyzés: A következő tárgyak nem tartoznak e fogalom alá: GYÚJTÓZSINÓR; GYÚJTÓZSINÓR-GYÚJTÓK; GYUTACSCSÖVEK, GYUTACS-SZELENCÉK; GYUTACSKAPSZULÁK; INDÍTÓGYÚJTÓK; PILLANATGYÚJTÓ, NEM ROBBANÓ; ROBBANÓZSINÓR. Ezek a jelen szójegyzékben külön szerepelnek.*

**GYÚJTÓZSINÓR**: UN 0066

Ez a tárgy vagy fekete lőporral vagy más, gyorsan égő pirotechnikai keverékkel bevont textilszálakból készül, amely szálak hajlékony tömlőben vannak, vagy fekete lőpor bélből áll, amely hajlékony szövött textilburkolattal van körülvéve. A gyújtózsínór teljes hosszúsága mentén előrehaladó nyílt lánggal ég, és a gyújtás átvitelére használatos valamely gyújtókészüléktől töltetre vagy gyújtószerkezetre.

**GYÚJTÓZSINÓR, BIZTONSÁGI: UN 0105**

Ez a tárgy finom szemcsés fekete lőpor belet tartalmaz, amely hajlékony textilszövetből álló egy- vagy többretegű külső burkolattal van ellátva. A zsinór meggyújtás után mindenféle robbanó hatás nélkül meghatározott sebességgel végigég.

**GYÚJTÓZSINÓR-GYÚJTÓK, cső formájú fémköpennyel: UN 0103**

Ez a tárgy deflagráló robbanóanyag-béllel ellátott fémcső.

**GYÚJTÓZSINÓR-GYÚJTÓK: UN 0131**

Különböző felépítésű tárgyak, amelyek a biztonsági gyújtózsínór begyújtására szolgálnak. Dörzsöléssel, ütéssel vagy villamos úton lépnek működésbe.

**GYUTACSCSÖVEK, GYUTACSSZELENCÉK: UN 0319, 0320, 0376**

Primer robbanóanyagból és deflagráló robbanóanyagból, pl. fekete lőporból, álló kiegészítő töltetet tartalmazó tárgyak. A lövegekhez való lövedék hüvelyében levő töltet indításához használják.

**GYUTACSKAPSZULÁK: UN 0044, 0377, 0378**

Ütésre könnyen robbanó, kis mennyiségű primer robbanóanyag keveréket tartalmazó fém- vagy műanyag gyutacs kapszula. Ezek a tárgyak kézfegyver töltényekben indítóelemként és lövegeknél ütőgyutacsaként használatosak.

**GYUTACSOK LŐSZEREKHEZ: UN 0073, 0364, 0365, 0366**

Ezek a tárgyak kis fém- vagy műanyagcsőből állnak, és robbanóanyagot, pl. ólom-azidot, PETN-t vagy robbanóanyagok kombinációját tartalmazzák. A gyújtólánc indítására valók.

**GYUTACSOK, NEMVILLAMOSAK, robbantáshoz: UN 0029, 0267, 0455**

Ezek a tárgyak az ipari robbantóanyagok indítására valók késleltető szerkezettel vagy anélkül. A nemvillamos gyutacsokat ütőgyújtóval, gyújtócsővel, gyújtózsínórral, egyéb robbantóeszközzel, vagy hajlékony robbanózsínórral hozzák működésbe. Ide tartoznak a robbanózsínór nélküli kapcsolók is.

**GYUTACSOK, VILLAMOSAK, robbantáshoz: UN 0030, 0255, 0456**

Ezek a tárgyak az ipari robbantóanyagok indítására szolgálnak, késleltető szerkezettel vagy anélkül. A villamos gyutacsokat villamos árammal hozzák működésbe.

**HAJTÓANYAG, FOLYÉKONY: UN 0495, 0497**

Deflagráló, folyékony robbanóanyag tárgyak mozgatására.

**HAJTÓANYAG, SZILÁRD: UN 0498, 0499, 0501**

Deflagráló, szilárd robbanóanyag tárgyak mozgatására.

**HAJTÓTÖLTETEK: UN 0271, 0272, 0415, 0491**

Ezek a tárgyak tetszőleges fizikai formájú hajtótöltetből állnak burkolattal vagy anélkül és mint rakétamotorok alkotórészeként vagy a lövedék lassulásának csökkentésére szolgálnak.

**HEXOTONAL: UN 0393**

Ez az anyag ciklotrimetilén-trinitramin (RDX), trinitro-toluol (TNT) és alumínium belsőseges keverékből áll.

**HEXOLIT (HEXOTOL)**, száraz vagy 15 tömeg%-nál kevesebb vízzel nedvesített: UN 0118

Ez az anyag ciklotrimetilén-trinitramin (RDX) és trinitro-toluol (TNT) belsőseges keverékéből áll. Ide tartozik a „Composition B” is.

**INDÍTÓGYÚJTÓK:** UN 0316, 0317, 0368

Ezek a tárgyak primer robbanóanyagot tartalmaznak, és lőszerekben a deflagráció kiváltására valók. A deflagráció kiváltására mechanikai, villamos, kémiai vagy hidrosztatikus úton aktiválható szerkezetet tartalmaznak. Rendszerint biztonsági szerkezettel rendelkeznek.

**JELZŐPATRONOK:** UN 0054, 0312, 0405

Ezek a tárgyak arra valók, hogy színes fényjeleket vagy más jeleket adjanak jelzőpisztolyból vagy egyéb eszközből kilőve.

**JELZŐTESTEK, KÉZI:** UN 0191, 0373

Ezek hordozható tárgyak, amelyek pirotechnikai anyagot tartalmaznak, és látható jelző vagy figyelmeztető hatást keltenek. Ide tartoznak a kisméretű földi világítótestek, pl. autópálya fáklyák, vasúti fáklyák vagy kis vízi fáklyák.

**KÁBELVÁGÓ SZERKEZET ROBBANÓANYAGGAL:** UN 0070

Ez a tárgy egy késszerű szerkezetből áll, amelyet deflagráló robbanóanyagból álló kis töltet egy ellendarabhoz sajtol.

**KÉZIFEGYVER TÖLTÉNYEK:** UN 0012, 0339, 0417

Olyan lőszer, amelyek központi vagy peremgyújtású töltényhüvelyből állnak, valamint kidobótöltetet és szilárd lövedéket tartalmaznak. Legfeljebb 19,1 mm kaliberű fegyverekhez valók. Ide tartoznak a tetszőleges kaliberű sörétpatronok.

*Megjegyzés: Nem tartoznak ide a VAKTÖLTÉNYEK KÉZIFEGYVEREKHEZ, amelyek külön vannak feltüntetve, és egyes katonai kézifegyvertöltények, amelyek a TÖLTÉNYEK FEGYVEREKHEZ INERT LÖVEDÉKKEL fogalomba tartoznak.*

**KIDOBÓTÖLTETEK LÖVEGEKHEZ:** UN 0242, 0279, 0414

Löveglőszerkezetekhez külön betöltendő kidobótöltetek bármilyen fizikai formában.

**KIOLDÓSZERKEZETEK, ROBBANÓANYAG TARTALMÚAK:** UN 0173

Ezek a tárgyak kis robbanótöltetből, gyújtószerkezetből és rudazatból vagy összekötő darabból állnak. Arra valók, hogy a rudazat vagy összekötő darab átszakításával a szerkezeteket gyorsan szétkapcsolják.

**KÖTÉLVETŐ RAKÉTÁK:** UN 0238, 0240, 0453

Ezek a tárgyak rakétahajtóműből állnak, és arra valók, hogy kötelet húzzanak magukkal.

**KÖZETREPESZTŐ TORPEDÓK**, detonátor nélkül, olajkutak fúrásához: UN 0099

Ezek a tárgyak gyújtószer nélküli detonáló robbanóanyagot tartalmazó házból állnak. A fúróluk környezetében a közet repesztésére használják, hogy a kőolaj kilépését a közetből megkönnyítsék.

**LÉGZSÁK GÁZGENERÁTOR** vagy **LÉGZSÁK MODUL** vagy **BIZTONSÁGI ÖV ELŐFESZÍTŐ**: UN 0503

Pirotechnikai anyagot tartalmazó tárgyak, amelyeket gépjárműben életmentő légszákként vagy biztonsági övként használnak.

**LŐPORBRIKETT (LŐPORPASZTA)**, legalább 17 tömeg% alkohollal **NEDVESÍTETT**: UN 0433**LŐPORBRIKETT (LŐPORPASZTA)**, legalább 25 tömeg% vízzel **NEDVESÍTETT**: UN 0159

Nitrocellulózsból álló anyag, amely legfeljebb 60 tömeg% nitroglicerinnel, más folyékony szerves nitráttal vagy ezek keverékével van impregnálva.

**LŐSZER, GYÚJTÓ HATÁSÚ**, gyúlékony folyadék vagy gél tartalommal, robbanó-, kidobó- vagy hajtótöltettel: UN 0247

Olyan lőszer, amelyek folyékony vagy gélszerű gyújtóanyagot tartalmaznak. Amennyiben a gyújtóanyag maga nem robbanóanyag, akkor a lőszer a következő alkotórészekből is tartalmaz egyet vagy többet: hajtótöltet gyutaccsal és indítótöltettel; gyújtók robbanó- vagy kidobótöltettel.

**LŐSZER, GYÚJTÓ HATÁSÚ**, robbanó-, kidobó- vagy hajtótöltettel vagy anélkül: UN 0009, 0010, 0300

Olyan lőszer, amelyek gyújtó hatású anyagot tartalmaznak. Amennyiben a gyújtóanyag maga nem robbanóanyag, akkor a lőszer a következő alkotórészekből is tartalmaz egyet vagy többet: hajtótöltet gyutaccsal és indítótöltettel; gyújtók robbanó- vagy kidobótöltettel.

**LŐSZER, GYÚJTÓ HATÁSÚ, FEHÉRFOSZFOR TARTALMÚ**, robbanó-, kidobó- vagy hajtótöltettel: UN 0243, 0244

Olyan lőszer, amelyek gyújtóanyagként fehérfoszfort tartalmaznak. A következő alkotórészekből is tartalmaznak egyet vagy többet: hajtótöltet gyutaccsal és indítótöltettel; gyújtók robbanó- vagy kidobótöltettel.

**LŐSZER, KÖNNYEZTETŐ HATÁSÚ**, robbanó-, kidobó- vagy hajtótöltettel: UN 0018, 0019, 0301

Olyan lőszer, amelyek könnyeztető anyagot tartalmaznak. A következő alkotórészekből is tartalmaznak egyet vagy többet: pirotechnikai anyag; hajtótöltet gyutaccsal és indítótöltettel; gyújtók robbanó- vagy kidobótöltettel.

**LŐSZER, VILÁGÍTÓ HATÁSÚ**, robbanó-, kidobó- vagy hajtótöltettel vagy anélkül: UN 0171, 0254, 0297

Olyan lőszer, amelyek intenzív fényforrásként szolgálhatnak valamely terület megvilágítására. A fogalom tartalmazza a világítógránátokat és világítólövedékeket, valamint a világítóbombákat és a célmegjelölő bombákat is.

*Megjegyzés: A következő tárgyak nem tartoznak e fogalomkörbe: JELZŐPATRONOK; JELZŐTESTEK, KÉZI; VÉSZJELZŐK, tengeri; VILÁGÍTÓTESTEK, FÖLDI; VILÁGÍTÓTESTEK, LÉGI. Ezek a jelen szójegyzékben külön vannak feltüntetve.*

**LÖVEDÉKEK**, inert, nyomjelzőszerrel: UN 0345, 0424, 0425

Olyan tárgyak, mint pl. a gránátok vagy golyók, amelyeket ágyúból vagy más lövegből, puskákból vagy más kézfegyverből lőnek ki.

**LÖVEDÉKEK** robbanó- vagy kidobótöltettel: UN 0346, 0347

Olyan tárgyak, mint pl. a gránátok vagy golyók, amelyeket ágyúból vagy más lövegből lőnek ki. Ezek a tárgyak vagy nem tartalmaznak gyújtószert vagy olyan gyújtószert tartalmaznak, amely legalább két hatékony biztonsági szerkezettel van ellátva. Színjelzésre vagy más inert anyag szétszórására valók.

**LÖVEDÉKEK** robbanó- vagy kidobótöltettel: UN 0426, 0427

Olyan tárgyak, mint pl. a gránátok vagy golyók, amelyeket ágyúból vagy más lövegből lőnek ki. Ezek a tárgyak olyan gyújtószert tartalmaznak, amely nincs ellátva legalább két hatékony biztonsági szerkezettel. Színjelzésre vagy más inert anyag szétszórására valók.

**LÖVEDÉKEK** robbanó- vagy kidobótöltettel: UN 0434, 0435

Olyan tárgyak, mint pl. a gránátok vagy golyók, amelyeket ágyúból vagy más lövegből, puskából vagy más kézfegyverből lőnek ki. Színjelzésre vagy más inert anyag szétszórására valók.

**LÖVEDÉKEK** robbanótöltettel: UN 0167, 0324

Olyan tárgyak, mint pl. a gránátok vagy golyók, amelyeket ágyúból vagy más lövegből lőnek ki. Ezek a tárgyak olyan gyújtószert tartalmaznak, amely nincs ellátva legalább két hatékony biztonsági szerkezettel.

**LÖVEDÉKEK** robbanótöltettel: UN 0168, 0169, 0344

Olyan tárgyak, mint pl. a gránátok vagy golyók, amelyeket ágyúból vagy más lövegből lőnek ki. Ezek a tárgyak vagy nem tartalmaznak gyújtószert vagy olyan gyújtószert tartalmaznak, amely legalább két hatékony biztonsági szerkezettel van ellátva.

**MUNKAVÉGZŐ TÖLTETEK:** UN 0275, 0276, 0323, 0381

Ezek a tárgyak arra valók, hogy mechanikai hatásokat váltsanak ki. Deflagráció robbanóanyagból álló töltetet és gyújtót tartalmazó házból állnak. A deflagrációs termékek robbanási gázai tárgyakat fújnak fel, egyenes vonalú vagy forgó mozgást hoznak létre, vagy megszakítókát, szelepeket vagy kapcsolókat működtetnek, rögzítőelemeket löknek ki, vagy oltószerkezeteket aktiválnak.

**NAGYON ÉRZÉKETLEN ROBBANÓANYAGOK (EVI ANYAGOK), M.N.N.:** UN 0482

Olyan anyagok, amelyek tömegrobbanási veszélyt képviselnek ugyan, de annyira érzéketlenek, hogy igen csekély az iniciálás vagy az égésből a detonálásba való átmenet veszélye a normális szállítási feltételek között, és amelyek kiállták az 5. vizsgálati sorozatot.

**NYOMJELZŐK LŐSZEREKHEZ:** UN 0212, 0306

Ezek olyan zárt tárgyak, amelyek pirotechnikai anyagot tartalmaznak és arra szolgálnak, hogy a lövedékek röppályáját láthatóvá tegyék.

**OKTOLIT (OKTOL),** száraz vagy 15 tömeg%-nál kevesebb vízzel nedvesített: UN 0266

Ez az anyag ciklotetrametilén-tetranitramin (HMX) és trinitro-toluol (TNT) belsőseges keverékéből áll.

**OKTONAL:** UN 0496

Ez az anyag ciklotetrametilén-tetranitramin (HMX), trinitro-toluol (TNT) és alumínium belsőseges keverékéből áll.

**PENTOLIT**, száraz vagy 15 tömeg%-nál kevesebb vízzel nedvesített: UN 0151

Ez az anyag pentaeritrit-tetranitrát (PETN) és trinitro-toluol (TNT) belsőseges keverékéből áll.

**PERFORÁTOR PUSKÁK, TÖLTETTEL**, detonátor nélkül, olajkutak fúrásához: UN 0124, 0494

Ezek a tárgyak acélcsőből vagy fémszalagból állnak, amelyben formázott töltetek vannak. A tölteteket robbanózsínórok kötik össze. Nem tartalmaznak indítószerkezetet.

**PILLANATGYÚJTÓ, NEM ROBBANÓ**: UN 0101

Ezek a tárgyak pamutszálakból állnak, amelyek fekete lőporral vannak impregnálva (gyújtószál). Nyílt lánggal égnék és tűzijáték testek stb. gyújtóláncaiban kerülnek alkalmazásra.

**PIROFOROS TÁRGYAK**: UN 0380

Ezek a tárgyak piroforos (levegő hatására öngyulladásra hajlamos) anyagot és valamilyen robbanóanyagot vagy robbanó alkotórészt tartalmaznak. Nem tartoznak e fogalom alá a fehérfoszfor tartalmú tárgyak.

**PIROTECHNIKAI TÁRGYAK** műszaki célokra: UN 0428, 0429, 0430, 0431, 0432

Olyan tárgyak, amelyek pirotechnikai anyagot tartalmaznak, és műszaki célokra használatosak, pl. hőfejlesztésre, gázfejlesztésre vagy színházi hatások elérésére.

*Megjegyzés: A következő tárgyak nem tartoznak e fogalomkörbe: FÜSTJELZŐK; - JELZŐPATRONOK; JELZŐTESTEK, KÉZI; KÁBELVÁGÓ SZERKEZET ROBBANÓANYAGGAL; KIOLDÓSZERKEZETEK, ROBBANÓ-ANYAG TARTALMÚAK; mindenféle lőszer; ROBBANÓSZEGECSEK; TŰZIJÁTÉK TESTEK; VASÚTI DURRANTYÚK; VÉSZJELZŐK, tengeri; VILÁGÍTÓTESTEK, FÖLDI; VILÁGÍTÓTESTEK, LÉGI. Ezek a jelen szójegyzékben külön vannak feltüntetve.*

**PRÓBALŐSZER**: UN 0363

Olyan lőszer, amely pirotechnikai anyagot tartalmaz, és új lőszer, fegyverrész vagy fegyverrendszer működőképességének és hatásosságának vizsgálatára való.

**RAKÉTAHAJTÓMŰVEK**: UN 0186, 0280, 0281

Ezek a tárgyak toló hatású töltetből (rendszerint szilárd hajtóanyagból) állnak, amely egy vagy több fúvókával ellátott hengerben található. Rakéták vagy irányítható lövedékek hajtására valók.

**RAKÉTAHAJTÓMŰVEK FOLYÉKONY HAJTÓANYAGGAL**: UN 0395, 0396

Ezek a tárgyak egy vagy több fúvókát tartalmazó hengerből állnak, amely folyékony hajtóanyagot tartalmaz. A tárgyak rakéták vagy irányítható lövedékek hajtására valók.

**RAKÉTAHAJTÓMŰVEK HIPERGOL FOLYADÉKOKKAL**, kidobótöltettel vagy anélkül: UN 0250, 0322

Ezek a tárgyak hipergol hajtóanyagból állnak, amely egy vagy több fúvókával ellátott hengerben található. Rakéták vagy irányítható lövedékek hajtására valók.

**RAKÉTÁK FOLYÉKONY HAJTÓANYAGGAL**, robbanótöltettel: UN 0397, 0398

Ezek a tárgyak folyékony hajtóanyaggal töltött, egy vagy több fúvókával ellátott hengerből

és támadófejből állnak. Ide tartoznak irányítható lövedékek is.

**RAKÉTÁK** inert fejjel: UN 0183, 0502

Ezek a tárgyak rakétahajtóműből és inert fejből állnak. Ide tartoznak irányítható lövedékek is.

**RAKÉTÁK** kidobótöltettel: UN 0436, 0437, 0438

A tárgyak rakétahajtóműből és kidobótöltetből állnak, a hasznos teher rakétafejből való kidobására szolgálnak. Ide tartoznak irányítható lövedékek is.

**RAKÉTÁK** robbanótöltettel: UN 0180, 0295

Ezek a tárgyak rakétahajtóműből és támadófejből állnak. Olyan gyújtószerkezetet tartalmaznak, amely nincs ellátva legalább két hatékony biztonsági szerkezettel. Ide tartoznak az irányítható lövedékek is.

**RAKÉTÁK** robbanótöltettel: UN 0181, 0182

Ezek a tárgyak rakétahajtóműből és támadófejből állnak. Vagy nem tartalmaznak gyújtószerkezetet vagy olyan gyújtószerkezetet tartalmaznak, amely legalább két hatékony biztonsági szerkezettel van ellátva. Ide tartoznak irányítható lövedékek is.

**RENDKÍVÜL ÉRZÉKETLEN ROBBANÓTÁRGYAK (EEI TÁRGYAK):** UN 0486

Olyan tárgyak, amelyek csak rendkívül érzéketlen detonáló robbanóanyagokat (EIDS) tartalmaznak és véletlen beindulási vagy detonálás továbbviteli-hajlamuk normális szállítási feltételek között elhanyagolható és kiállták a 7. vizsgálati sorozatot.

**ROBBANÓANYAG MINTÁK,** az indító robbanóanyagok kivételével: UN 0190

Új vagy régebben létező robbanóanyagok vagy robbanótárgyak, amelyek nincsenek besorolva a 3.2 fejezet „A” táblázatának egyetlen megnevezése alá sem, és az illetékes hatóság előírásai szerint általában kis mennyiségben kerülnek szállításra, többek között kísérleti, besorolási, kutatási és fejlesztési vagy minőségellenőrzési célból, vagy mint kereskedelmi minták.

***Megjegyzés:** Azok a robbanóanyagok és robbanótárgyak, amelyek a 3.2 fejezet „A” táblázatának valamely más megnevezése alá vannak besorolva, nem esnek ezen fogalom alá.*

**ROBBANÓGYÚJTÓK:** UN 0106, 0107, 0257, 0367

Ezek a tárgyak robbanóelemeket tartalmaznak, amelyek a lőszerekben a detonáció kiváltására szolgálnak. A detonáció kiváltására mechanikai, villamos, kémiai vagy hidrosztatikus úton aktiválható szerkezetet tartalmaznak. Rendszerint biztonsági szerkezet is be van építve.

**ROBBANÓGYÚJTÓK** biztonsági szerkezettel: UN 0408, 0409, 0410

Ezek a tárgyak robbanó elemeket tartalmaznak, amelyek a lőszerekben a detonáció kiváltására szolgálnak. A detonáció kiváltására mechanikai, villamos, kémiai vagy hidrosztatikus úton aktiválható szerkezetet tartalmaznak. A robbanógyújtókban legalább két hatékony biztonsági szerkezetnek is kell lennie.

**ROBBANÓLÁNC ALKOTÓRÉSZEI, M.N.N.:** UN 0382, 0383, 0384, 0461

Tárgyak, amelyek a detonáció vagy deflagráció továbbvitelére szolgálnak a robbanólánc mentén.

**ROBBANÓSZEGECSEK: UN 0174**

Ezek a tárgyak fémszegecsek, belül levő kis robbanóanyag-töltettel.

**ROBBANÓSZONDÁK: UN 0204, 0296**

Ezek a tárgyak detonáló robbanóanyag-töltetből állnak. Olyan gyújtószer tartalmaznak, amely nincs ellátva (legalább két) hatékony biztonsági szerkezettel. Hajókról dobják a vízbe, és meghatározott vízmélységben vagy a tengerfenékre érve robbannak.

**ROBBANÓSZONDÁK: UN 0374, 0375**

Ezek a tárgyak detonáló robbanóanyag-töltetből állnak. Vagy nem tartalmaznak gyújtószerkezetet vagy olyan gyújtószerkezetet tartalmaznak, amely legalább két hatékony biztonsági szerkezettel van ellátva. Hajókról dobják a vízbe, és meghatározott vízmélységben vagy a tengerfenékre érve robbannak.

**ROBBANÓTÖLTETEK: UN 0048**

Ezek a tárgyak papírlémezből, műanyagból, fémből vagy más anyagból készített házból állnak és detonáló robbanóanyag-töltetet tartalmaznak. Vagy nem tartalmaznak gyújtószerkezetet vagy olyan gyújtószerkezetet tartalmaznak, amely legalább két hatékony biztonsági szerkezettel van ellátva.

***Megjegyzés:** A következő tárgyak nem tartoznak e fogalomkörbe: AKNÁK; BOMBÁK; LÖVEDÉKEK. Ezek a jelen szójegyzékben külön vannak feltüntetve.*

**ROBBANÓTÖLTETEK, IPARIAK, detonátor nélkül: UN 0442, 0443, 0444, 0445**

Ezek a tárgyak gyújtószerkezet nélküli detonáló robbanóanyag-töltetből állnak. Robbantásos hegesztéshez, robbantásos illesztéshez, robbantásos sajtoláshoz vagy más fémmegmunkálási eljáráshoz használatosak.

**ROBBANÓTÖLTETEK, KIEGÉSZÍTŐK: UN 0060**

Ezek a tárgyak kisméretű, eltávolítható erősítőöltetek, amelyet a lövedékek üregébe az indítógyújtó és a fő robbanóöltet közé helyeznek el.

**ROBBANÓTÖLTETEK, MŰANYAG KÖTÉSŰEK: UN 0457, 0458, 0459, 0460**

Ezek a tárgyak műanyag kötésű detonáló robbanóanyag-töltetből állnak. Burkolat nélküli speciális alakúak, és nem tartalmaznak gyújtószerkezetet. Lőszerek, pl. támadófejek alkotórészeként használatosak.

**ROBBANÓZSINÓR, fémköpenyes: UN 0102, 0290**

Ez a tárgy lágy fémcsőben lévő detonáló robbanóanyag-bélből áll, védőbevonattal ellátva vagy anélkül.

**ROBBANÓZSINÓR, hajlékony: UN 0065, 0289**

Ez a tárgy detonáló robbanóanyag-bélből áll, textilszállal körbefonva, műanyagból vagy más anyagból álló burkolattal ellátva. A burkolat nem szükséges, ha a textílfonat portömör.

**ROBBANÓZSINÓR, KISHATÁSÚ, fémköpennyel: UN 0104**

Ez a tárgy lágy fémcsőben lévő detonáló robbanóanyag-bélből áll, védőbevonattal ellátva vagy anélkül. A robbanóanyag mennyisége olyan csekély, hogy kifelé csak kis hatás lép fel.

**ROBBANTÓTÖLTETEK, PROFILOZOTT, HAJLÉKONY, VONAL ALAKÚ: UN 0237, 0288**

Ezek a tárgyak detonáló robbanóanyagból készült V alakú bélből állnak hajlékony köpenybe burkolva.

**SZÉTVETŐK, robbantótöltettel: UN 0043**

Ezek a tárgyak kis robbantótöltetek. Lövedékek vagy más lőszeres szétrobbantására valók, hogy azok tartalma szétszóródjon.

**TÁMADÓFEJEK RAKÉTÁKHOZ robbanó- vagy kidobótöltettel: UN 0370**

Ezek a tárgyak inert hasznos teherből és detonáló vagy deflagráló robbanóanyagot tartalmazó kis töltetből állnak. Vagy nem tartalmaznak gyújtószerkezetet vagy olyan gyújtószerkezetet tartalmaznak, amely legalább két hatékony biztonsági szerkezettel van ellátva. Rakétákba vannak beszerelve az inert anyag szétszórása céljából. Ide tartoznak irányított lövedékek támadófejei is.

**TÁMADÓFEJEK RAKÉTÁKHOZ robbanó- vagy kidobótöltettel: UN 0371**

Ezek a tárgyak inert hasznos teherből és detonáló vagy deflagráló robbanóanyagot tartalmazó kis töltetből állnak. Olyan gyújtószerkezetet tartalmaznak, amely nincs ellátva (két vagy több) hatékony biztonsági szerkezettel. Rakétákba vannak beszerelve az inert anyag szétszórása céljából. Ide tartoznak irányított lövedékek támadófejei is.

**TÁMADÓFEJEK RAKÉTÁKHOZ robbantótöltettel: UN 0286, 0287**

Ezek a tárgyak detonáló robbanóanyagból állnak, amely vagy nem tartalmaz gyújtószerkezetet, vagy olyan gyújtószerkezetet tartalmaz, amely legalább két hatékony biztonsági szerkezettel van ellátva. Rakétákba vannak beszerelve. Ide tartoznak az irányított lövedékek támadófejei is.

**TÁMADÓFEJEK RAKÉTÁKHOZ robbantótöltettel: UN 0369**

Ezek a tárgyak detonáló robbanóanyagból állnak, amely olyan gyújtószerkezetet tartalmaz, ami nincs ellátva (két vagy több) hatékony biztonsági szerkezettel. Rakétákba vannak beszerelve. Ide tartoznak az irányított lövedékek támadófejei is.

**TÁMADÓFEJEK TORPEDÓKHOZ robbantótöltettel: UN 0221**

Ezek a tárgyak detonáló robbanóanyagból állnak. Vagy nem tartalmaznak gyújtószerkezetet, vagy olyan gyújtószerkezetet tartalmaznak, amely legalább két hatékony biztonsági szerkezettel van ellátva. Torpedókba vannak beszerelve.

**TORPEDÓK FOLYÉKONY HAJTÓANYAGGAL, inert fejjel: UN 0450**

Ezek a tárgyak folyékony robbanóanyagot tartalmazó hajtórendszerből, amely a torpedót a víz alatt mozgatja, és inert fejből állnak.

**TORPEDÓK FOLYÉKONY HAJTÓANYAGGAL, robbantótöltettel vagy anélkül: UN 0449**

Ezek a tárgyak vagy folyékony robbanóanyagot tartalmazó hajtórendszerből állnak, amely a támadófejjel ellátott vagy anélküli torpedót a víz alatt mozgatja, vagy folyékony nem robbanó anyagot tartalmazó hajtórendszerből állnak, amely a támadófejjel ellátott torpedót a víz alatt mozgatja.

**TORPEDÓK robbantótöltettel: UN 0329**

Ezek a tárgyak támadófejből és folyékony robbanóanyagot tartalmazó hajtórendszerből

állnak, amely a torpedót a víz alatt mozgatja. A támadófej vagy nem tartalmaz gyújtószerkezetet vagy olyan gyújtószerkezetet tartalmaz, amely legalább két hatékony biztonsági szerkezettel van ellátva.

**TORPEDÓK** robbanótöltettel: UN 0330

Ezek a tárgyak támadófejből és folyékony robbanóanyagot vagy nem robbanó anyagot tartalmazó hajtórendszerből állnak, amely a torpedót a víz alatt mozgatja. A támadófej olyan gyújtószerkezetet tartalmaz, amely nincs ellátva két vagy több hatékony biztonsági szerkezettel.

**TORPEDÓK** robbanótöltettel: UN 0451

Ezek a tárgyak támadófejből és folyékony, nem robbanó hajtórendszerből állnak, amely a torpedót a víz alatt mozgatja. A támadófej vagy nem tartalmaz gyújtószerkezetet vagy olyan gyújtószerkezetet tartalmaz, amely legalább két hatékony biztonsági szerkezettel van ellátva.

**TÖLTÉNYEK FEGYVEREKHEZ INERT LÖVEDÉKKEL:** UN 0012, 0328, 0339, 0417

Olyan lőszer, amely robbanótöltet nélküli lövedékből és kidobótöltetből áll gyutaccsal vagy gyutacs nélkül. A lőszer nyomjelzőszert tartalmazhat, feltéve, hogy a fő veszélyt a kidobótöltet képezi.

**TÖLTÉNYEK FEGYVEREKHEZ** robbanólövedékkal: UN 0005, 0007, 0348

Olyan lőszer, amely robbanótöltetet tartalmazó lövedékből és kidobótöltetből áll gyutaccsal vagy gyutacs nélkül. A lövedék olyan gyújtószerkezetet tartalmaz, amely nincs ellátva (legalább két) hatékony biztonsági szerkezettel. Ide tartoznak összeszerelt löszerek, félig összeszerelt löszerek és különálló darabokból álló löveg löszerek, amennyiben egybe vannak csomagolva.

**TÖLTÉNYEK FEGYVEREKHEZ** robbanólövedékkal: UN 0006, 0321, 0412

Olyan lőszer, amely robbanótöltetet tartalmazó lövedékből és kidobótöltetből áll gyutaccsal vagy gyutacs nélkül. A lövedék vagy nem tartalmaz gyújtószerkezetet vagy olyan gyújtószerkezetet tartalmaz, amely legalább két hatékony biztonsági szerkezettel van ellátva. Ide tartoznak összeszerelt löszerek, félig összeszerelt löszerek és különálló darabokból álló löveg löszerek, amennyiben egybe vannak csomagolva.

**TÖLTÉNYHÜVELYEK, ÜRESEK, ÉGHETŐK, GYUTACS NÉLKÜL:** UN 0446, 0447

Ezek a tárgyak részben vagy teljes egészében nitrocellulózból gyártott töltényhüvelyek.

**TÖLTÉNYHÜVELYEK, ÜRESEK, GYUTACCSAL:** UN 0055; 0379

Ezek a tárgyak fémből, műanyagból vagy más, nem éghető anyagból készülnek. Egyetlen robbanó alkotórészük a gyutacs.

**TRITONAL:** UN 0390

Ez az anyag trinitro-toluol (TNT) és alumínium keverékéből áll.

**TŰZIJÁTÉK TESTEK:** UN 0333, 0334, 0335, 0336, 0337

Olyan pirotechnikai tárgyak, amelyek szórakoztatási célokra használatosak.

**VAKTÖLTÉNYEK FEGYVEREKHEZ:** UN 0014, 0326, 0327, 0338, 0413

Olyan lőszer, amely zárt töltényhüvelyből áll központi vagy peremgyújtással és feketelőpor-

vagy füst nélküli lőportöltetet tartalmaz. A töltényhüvely nem tartalmaz lövedéket. Erős durranás keltésére valók, valamint gyakorláshoz, díszlövéshez, kidobótöltetként és indítópisztolyokhoz stb. használatosak. Ide tartoznak a gyakorló löszerek is.

**VAKTÖLTÉNYEK KÉZIFEGYVEREKHEZ:** UN 0014, 0327, 0338

Olyan löszer, amely zárt töltényhüvelyből áll központi vagy peremgyújtással és feketelőpor- vagy füst nélküli lőportöltetet tartalmaz. A töltényhüvely nem tartalmaz lövedéket. Legfeljebb 19,1 mm kaliberű fegyverekhez valók és erős durranás keltésére szolgálnak és gyakorláshoz, díszlövéshez, kidobótöltetként és indítópisztolyokhoz stb. használatosak.

**VASÚTI DURRANTYÚK:** UN 0192, 0193, 0492, 0493

Ezek a tárgyak pirotechnikai anyagot tartalmaznak, amely a tárgy összetörésekor erős hanghatással felrobban. Vasúti sínre helyezik.

**VÉSZJELZŐK,** tengeri: UN 0194, 0195, 0505, 0506

Ezek a tárgyak pirotechnikai anyagot tartalmaznak és arra valók, hogy durranás, láng, füst vagy ezek kombinációja formájában jelzést adjanak.

**VILÁGÍTÓTESTEK, FÖLDI:** UN 0092, 0418, 0419

Ezek a tárgyak pirotechnikai anyagot tartalmaznak, és a földön megvilágításra, jelzésre, megjelölésre vagy figyelmeztetésre használatosak.

**VILÁGÍTÓTESTEK, LÉGI:** UN 0093, 0403, 0404, 0420, 0421

Ezek a tárgyak pirotechnikai anyagot tartalmaznak és légi járműről ledobva megvilágításra, jelzésre, megjelölésre vagy figyelmeztetésre szolgálnak.

**VILLANÓFÉNY-PATRONOK:** UN 0049, 0050

Ezek a tárgyak házból, gyújtóelemből és villanópor-készletből állnak. Minden alkotórész egyetlen, kilövésre kész tárggyá van egyesítve.

**VILLANÓFÉNYPOR:** UN 0094, 0305

Olyan pirotechnikai anyag, amely meggyújtáskor intenzív fényt kelt.

**VÍZIBOMBÁK:** UN 0056

Ezek a tárgyak detonáló robbanóanyagot tartalmazó hordóból, dobból vagy lövedékből állnak, amely vagy nem tartalmaz gyújtószerkezetet, vagy olyan gyújtószerkezetet tartalmaz, amely legalább két hatékony biztonsági szerkezettel van ellátva. Víz alatti robbanás előidézésére valók.

**VÍZZEL AKTIVÁLHATÓ SZERKEZETEK** robbanó-, kidobó- vagy hajtótöltettel: UN 0248, 0249

Olyan tárgyak, amelyek működése tartalmuk vízzel való fizikai-kémiai reakciójától függ.

**2.2.1.2** *A fuvarozásból kizárt anyagok és tárgyak*

**2.2.1.2.1** Azok a robbanóanyagok, amelyek a „Vizsgálatok és kritériumok kézikönyv”, I. Rész kritériumai szerint nagymértékben robbanásérzékenyek, vagy amelyeknél spontán reakció léphet fel, valamint azok a robbanóanyagok és -tárgyak, amelyek nem sorolhatók a 3.2 fejezet „A” táblázatának valamely megnevezése vagy m.n.n. tétele alá, a fuvarozásból ki vannak zárva.

**2.2.1.2.2** Az A összeférhetőségi csoport anyagai (1.1A – UN 0074, 0113, 0114, 0129, 0130, 0135, 0224 és 0473) a vasúti fuvarozásból ki vannak zárva.

A K összeférhetőségi csoport tárgyai a fuvarozásból ki vannak zárva (1.2K - UN 0020 és 1.3K - UN 0021).

**2.2.1.3**

a) EVI = explosive, very insensitive (angol rövidítés)

b) EEI = explosive, extremely insensitive (angol rövidítés)

**2.2.2 2 osztály Gázok****2.2.2.1 Kritériumok****2.2.2.1.1** A 2 osztály fogalma a tiszta gázokra, a gázkeverékekre, egy vagy több gáz keverékére egy vagy több más anyaggal, valamint az ilyen anyagokat tartalmazó tárgyakra terjed ki.

A gázok olyan anyagok, amelyek

- a) gőznyomása 50 °C-on meghaladja a 300 kPa-t (3 bar-t); vagy
- b) 20 °C-on és 101,3 kPa normál nyomáson teljesen gáz alakúak.

**Megjegyzés:** 1. Az UN 1052 vízmentes hidrogén-fluorid azonban a 8 osztály anyaga.

2. Valamely tiszta gáz tartalmazhat egyéb alkotórészeket is a gyártási folyamatból adódóan vagy hozzáadott anyagokat a termék stabilitásának megőrzésére, amennyiben ezen alkotórészek koncentrációja nem módosítja a gáz besorolását vagy a szállítási feltételeket, mint pl. a töltési fokot, a töltőnyomást, a próbanyomást.

3. A 2.2.2.3 bekezdés m.n.n. tételei tiszta gázokra és gázkeverékekre egyaránt vonatkoznak.

4. A szénsavas italok nem tartoznak a RID előírásainak hatálya alá.

**2.2.2.1.2** A 2 osztály anyagai és tárgyai a következők szerint vannak csoportosítva:

- 1. Sűrített gáz: olyan gáz, amely a szállításra szánt csomagolásban túlnyomás alatt –50 °C-on teljesen gáz halmazállapotú; ebbe a kategóriába tartozik minden gáz, amelynek kritikus hőmérséklete –50 °C vagy annál alacsonyabb
- 2. Cseppfolyósított gáz: olyan gáz, amely a szállításra szánt csomagolásban túlnyomás alatt –50 °C felett részben folyékony állapotban van. Meg kell különböztetni a következőket:
  - nagy nyomáson cseppfolyósított gáz: olyan gáz, amelynek kritikus hőmérséklete –50 °C-nál magasabb, de legfeljebb +65 °C;
  - kis nyomáson cseppfolyósított gáz: olyan gáz, amelynek kritikus hőmérséklete +65 °C-nál magasabb
- 3. Mélyhűtött, cseppfolyósított gáz: olyan gáz, amely a szállításra szánt csomagolásban alacsony hőmérséklete folytán részben folyékony állapotban van
- 4. Oldott gáz: olyan gáz, amely a szállításra szánt csomagolásban túlnyomás alatt folyadék fázisú oldószerben van oldva
- 5. Aeroszol csomagolások és gázzal töltött kisméretű tartályok (gázpatronok)
- 6. Túlnyomás alatti gázt tartalmazó egyéb tárgyak
- 7. Túlnyomás nélküli gázok, amelyekre különleges előírások érvényesek (gázminták).

**2.2.2.1.3** A 2 osztály anyagai és tárgyai (az aeroszokok kivételével) veszélyes tulajdonságaik alapján a következő csoportok valamelyikéhez vannak hozzárendelve:

- A fojtó
- O gyújtó hatású
- F gyúlékony
- T mérgező

TF mérgező, gyúlékony  
TC mérgező, maró  
TO mérgező, gyújtó hatású  
TFC mérgező, gyúlékony, maró  
TOC mérgező, gyújtó hatású, maró.

Ha a gázok vagy gázkeverékek veszélyes tulajdonságai a kritériumok alapján egynél több csoporthoz tartoznak, a T betűvel jelölt csoportok minden más csoportot megelőznek. Az F betűvel jelölt csoportok megelőzik az A vagy O betűvel jelölteket.

**Megjegyzés:** 1. Az ENSZ Minta Szabályzatban, az IMDG kódexben és az ICAO Műszaki Utasításokban a gázokat az általuk képviselt fő veszély alapján a következő három alosztály egyikébe sorolják:

- 2.1 alosztály: gyúlékony gázok (megfelel az F betűvel jelölt csoportokba tartozó gázoknak);
- 2.2 alosztály: nem gyúlékony, nem mérgező gázok (megfelel az A vagy az O betűvel jelölt csoportokba tartozó gázoknak);
- 2.3 alosztály: mérgező gázok (megfelel a T betűvel jelölt, azaz T, TF, TC, TO, TFC és TOC csoportba tartozó gázoknak).

2. A gázzal töltött kisméretű tartályokat (UN 2037) a tartalom veszélyessége alapján az A – TOC csoport valamelyikéhez kell hozzárendelni. Az aeroszolokra (UN 1950) lásd a 2.2.2.1.6 pontot

3. A maró hatású gázok mérgezőnek is tekintendők és ezért a TC, a TFC vagy a TOC csoportba vannak sorolva.

4. A 21 térf. %-nál nagyobb oxigéntartalmú gázkeverékeket gyújtó hatásúnak kell besorolni.

**2.2.2.1.4** Ha a 2 osztálynak a 3.2 fejezet „A” táblázatában név szerint említett valamely keveréke a 2.2.2.1.2 és a 2.2.2.1.5 pontban felsorolt kritériumoktól eltérőeket elégít ki, akkor ezt a keveréket ezen kritériumok szerint kell besorolni és a megfelelő m.n.n. tételhez hozzárendelni.

**2.2.2.1.5** A 2 osztály azon anyagait és tárgyait (az aeroszolok kivételével), amelyek a 3.2 fejezet „A” táblázatában nincsenek név szerint feltüntetve a 2.2.2.1.2 és a 2.2.2.1.3 pont szerint a 2.2.2.3 bekezdésben felsorolt valamely gyújtómegnevezés alá kell besorolni. A kritériumok a következők:

*Fojtó gázok*

Olyan nem gyúlékony, nem gyújtó hatású és nem mérgező gázok, amelyek a légkörben rendes körülmények között jelen levő oxigént hígítják vagy kiszorítják.

*Gyúlékony gázok*

Olyan gázok, amelyek 20 °C-on és 101,3 kPa normál nyomáson

- a) a levegővel alkotott, legfeljebb 13 térf. % gázt tartalmazó keverék formájában gyúlékonyak (alsó robbanási határuk legfeljebb 13%); vagy
- b) az alsó robbanási határuktól függetlenül a levegővel legalább 12 százalékpont terjedelmű robbanási tartománnyal bírnak.

A gyúlékonyságot vizsgálatokkal vagy számítással kell meghatározni az ISO által elfogadott módszerek (lásd az ISO 10156:1996 szabványt) szerint.

Ha nem áll elegendő adat rendelkezésre ezen módszerek használatához, a származási ország illetékes hatósága által elismert más, azonos értékű vizsgálati eljárások is alkalmazhatók.

Ha a származási ország nem valamely COTIF Tagállam, akkor ezeket a módszereket a küldemény által érintett első COTIF Tagállam illetékes hatóságának kell elismernie.

#### *Gyújtó hatású (oxidáló) gázok*

Olyan gázok, amelyek általában oxigén leadásával tüzet okozhatnak, vagy más anyagok égését a levegőnél nagyobb mértékben elősegíthetik. Az oxidáló képességet az ISO által elfogadott módszer (lásd az ISO 10156:1996 és az ISO 10156-2:2005 szabványt) szerinti vizsgálattal vagy számítással kell meghatározni.

#### *Mérgező gázok*

**Megjegyzés:** Azokat a gázokat, amelyek részben vagy teljes egészében a maró hatásuk következtében elégitik ki a mérgezőképesség kritériumait, mérgező gázokként kell besorolni. A maró hatás, mint lehetséges járulékos veszély kritériumait lásd a „maró gázok” címszó alatt is.

Olyan gázok,

- amelyekről ismert, hogy az emberi egészséget veszélyeztető mértékben mérgezők vagy marók; vagy
- amelyekről feltételezhető, hogy az emberre nézve mérgezők vagy marók, mivel a 2.2.61.1 bekezdés szerint vizsgálva az akut mérgezési  $LC_{50}$  értékük legfeljebb  $5000 \text{ ml/m}^3$  (ppm).

A gázkeverékek (beleértve a más osztályba tartozó anyagok gőzeit) esetében a következő képlet használható:

$$a \text{ mérgező (keverék) } LC_{50} \text{ értéke} = \frac{1}{\sum_{i=1}^n \frac{f_i}{T_i}}$$

ahol

$f_i$  = a keverék  $i$ -edik alkotórészének mólaránya

$T_i$  = a keverék  $i$ -edik alkotórészének toxicitási mutatója. A  $T_i$ -érték egyenlő a 4.1.4.1 bekezdés P200 csomagolási utasítása szerinti  $LC_{50}$  értékkel. Amennyiben az  $LC_{50}$  érték nem szerepel a 4.1.4.1 bekezdés P200 csomagolási utasításában, a szakirodalomban található  $LC_{50}$  értéket kell használni. Ha az  $LC_{50}$  érték ismeretlen, a toxicitási mutatót a hasonló fiziológiai és kémiai hatásokkal rendelkező anyagok legalacsonyabb  $LC_{50}$  értéke alapján kell meghatározni, vagy – ha ez az egyetlen gyakorlati lehetőség – kísérleteket kell végezni.

#### *Maró gázok*

Azokat a gázokat és gázkeverékeket, amelyek teljes egészében a maró hatásuk következtében elégitik ki a mérgezőképesség kritériumait, mint maró járulékos veszéllyel bíró mérgező gázokat kell besorolni.

Egy olyan gázkeveréknek, amely a maró és mérgező hatás kombinálódása folytán mérgezőnek tekintendő, akkor van maró járulékos veszélye, ha emberen szerzett tapasztalatok alapján ismert, hogy roncsolja a bőrt, a szemet vagy a nyálkahártyát, vagy ha a keverék maró alkotórészeinek  $LC_{50}$  értéke a következő képlettel számítva legfeljebb  $5000 \text{ ml/m}^3$  (ppm):

$$a \text{ maró (keverék) } LC_{50} \text{ értéke} = \frac{1}{\sum_{i=1}^n \frac{fc_i}{Tc_i}}$$

ahol

$fc_i$  = a keverék i-edik alkotórészének mólaránya

$Tc_i$  = a keverék i-edik maró alkotórészének toxicitási mutatója. A  $Tc_i$ -érték egyenlő a 4.1.4.1 bekezdés P200 csomagolási utasítása szerinti  $LC_{50}$  értékkel. Amennyiben az  $LC_{50}$  érték nem szerepel a 4.1.4.1 bekezdés P200 csomagolási utasításában, a szakirodalomban található  $LC_{50}$  értéket kell használni. Ha az  $LC_{50}$  érték ismeretlen, a toxicitási mutatót a hasonló fiziológiai és kémiai hatásokkal rendelkező anyagok legalacsonyabb  $LC_{50}$  értéke alapján kell meghatározni, vagy – ha ez az egyetlen gyakorlati lehetőség – kísérleteket kell végezni.

#### 2.2.2.1.6 Aeroszolak

Az aeroszolak (UN 1950) veszélyes tulajdonságaik alapján a következő csoportok valamelyikéhez vannak hozzárendelve:

- A fojtó
- O gyújtó hatású
- F gyúlékony
- T mérgező
- C maró
- CO maró, gyújtó hatású
- FC gyúlékony, maró
- TF mérgező, gyúlékony
- TC mérgező, maró
- TO mérgező, gyújtó hatású
- TFC mérgező, gyúlékony, maró
- TOC mérgező, gyújtó hatású, maró.

A csoporthoz rendelés az aeroszol csomagolás tartalmának tulajdonságaitól függ.

**Megjegyzés:** Aeroszol csomagolások hajtóanyagaként nem használhatók a 2.2.2.1.5 pont kritériumai szerint mérgező gázok, ill. a 4.1.4.1 bekezdés P200 csomagolási utasítása szerint piroforos gázok. Azok az aeroszolak, amelyek tartalma mérgezőképesség vagy maró hatás tekintetében a I csomagolási csoportnak felel meg, a fuvarozásból ki vannak zárva (lásd még a 2.2.2.2.2 pontot is).

A kritériumok a következők:

- a) az A csoporthoz kell hozzárendelni, ha a tartalom a következő b) – f) pont szerinti, egyetlen más csoport kritériumainak sem felel meg;
- b) az O csoporthoz kell hozzárendelni, ha az aeroszol a 2.2.2.1.5 pont szerint gyújtó hatású (oxidáló) gázt tartalmaz;
- c) az F csoporthoz kell hozzárendelni, ha a tartalom 85 tömeg% vagy annál több

gyúlékony alkotórészt tartalmaz és a kémiai égéshő 30 kJ/g vagy annál nagyobb;

nem kell az F csoporthoz hozzárendelni, ha a tartalom 1 tömeg% vagy annál kevesebb gyúlékony alkotórészt tartalmaz és a kémiai égéshő 20 kJ/g-nál kisebb;

egyéb esetekben az aeroszol gyúlékonyságát a „Vizsgálatok és kritériumok kézikönyv”, III. rész 31. fejezetében leírt vizsgálatokkal kell meghatározni. A vizsgálat szerint „rendkívül gyúlékony”, ill. „gyúlékony” aeroszolókat az F csoporthoz kell hozzárendelni.

**Megjegyzés:** A gyúlékony alkotórészek a „Vizsgálatok és kritériumok kézikönyv”, III. rész 31.1.3 szakaszához fűzött 1 – 3. megjegyzésben meghatározott gyúlékony folyékony anyagok, gyúlékony szilárd anyagok, ill. gyúlékony gázok és gázkeverékek. Ez a meghatározás nem terjed ki a piroforos, az önmelegedő és a vízzel reaktív anyagokra. A kémiai égéshőt a következő módszerek valamelyikével kell meghatározni: ASTM D 240, ISO/FDIS 13943: 1999 (E/F) 86.1 – 86.3, ill. NFPA 30B.

- d) a T csoporthoz kell hozzárendelni, ha a tartalom, az aeroszol csomagolás hajtóanyagát kivéve, a 6.1 osztály II vagy III csomagolási csoportjába tartozik;
- e) a C csoporthoz kell hozzárendelni, ha a tartalom, az aeroszol csomagolás hajtóanyagát kivéve, kielégíti a 8 osztály II vagy III csomagolási csoportjának kritériumait;
- f) ha az O, F, T és C csoport közül egynél több kritériuma teljesül, akkor az esettől függően a CO, FC, TF, TC TO, TFC vagy TOC csoporthoz kell hozzárendelni.

## **2.2.2.2 A fuvarozásból kizárt gázok**

**2.2.2.2.1** A 2 osztály vegyileg nem állandó anyagai csak akkor fuvarozhatók, ha megtették a szükséges intézkedéseket a normális szállítási körülmények között a veszélyes reakció, mint pl. bomlás, szétválás vagy polimerizálódás mindenfajta lehetőségének megakadályozására. E célból különösen arról kell gondoskodni, hogy a tartályok és tartányok ne tartalmazzanak olyan anyagokat, amelyek ezeket a reakciókat elősegíthetik.

**2.2.2.2.2** A következő anyagok és keverékek a fuvarozásból ki vannak zárva:

- UN 2186 hidrogén-klorid, mélyhűtött, cseppfolyósított;
- UN 2421 nitrogén-trioxid;
- UN 2455 metil-nitrit;
- azok a mélyhűtött, cseppfolyósított gázok, amelyek nem sorolhatók a 3A, 3O vagy 3F osztályozási kód alá;
- azok az oldott gázok, amelyek nem sorolhatók az UN 1001, 2073 vagy 3318 alá;
- azok az aeroszolókat, amelyek hajtógázként olyan gázt tartalmaznak, amely a 2.2.2.1.5 pont kritériuma szerint mérgező, vagy a 4.1.4.1 bekezdés P200 csomagolási utasítás kritériuma szerint piroforos;
- azok az aeroszolókat, amelyek tartalma a mérgezőképesség vagy maró hatás tekintetében az I csomagolási csoportnak felel meg (lásd a 2.2.61 és a 2.2.8 szakaszt);
- azok a nagyon mérgező gázzal ( $LC_{50}$  200 ppm-nél kisebb) vagy olyan gázzal töltött kisméretű tartályok (gázpatronok), amely gáz a 4.1.4.1 bekezdés P200 csomagolási utasítás kritériuma szerint piroforos.

## 2.2.2.3

## A gyűjtőmegnevezések felsorolása

Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
<i>Sűrített gázok</i>		
1A	1956	SŰRÍTETT GÁZ, M.N.N.
1O	3156	SŰRÍTETT GÁZ, GYÚJTÓ HATÁSÚ, M.N.N.
1F	1964	SZÉNHIDROGÉN-GÁZ KEVERÉK, SŰRÍTETT, M.N.N.
	1954	SŰRÍTETT GÁZ, GYÚLÉKONY, M.N.N.
1T	1955	SŰRÍTETT GÁZ, MÉRGEZŐ, M.N.N.
1TF	1953	SŰRÍTETT GÁZ, MÉRGEZŐ, GYÚLÉKONY, M.N.N.
1TC	3304	SŰRÍTETT GÁZ, MÉRGEZŐ, MARÓ, M.N.N.
1TO	3303	SŰRÍTETT GÁZ, MÉRGEZŐ, GYÚJTÓ HATÁSÚ, M.N.N.
1TFC	3305	SŰRÍTETT GÁZ, MÉRGEZŐ, GYÚLÉKONY, MARÓ, M.N.N.
1TOC	3306	SŰRÍTETT GÁZ, MÉRGEZŐ, GYÚJTÓ HATÁSÚ, MARÓ, M.N.N.
<i>Cseppfolyósított gázok</i>		
2A	1058	CSEPPFOLYÓSÍTOTT GÁZ, nem gyúlékony, nitrogén, széndioxid vagy levegő alatt
	1078	HŰTŐGÁZ, M.N.N. mint pl. az R ... jelű gázok keveréke, azaz: F1 keverék, amelynek gőznyomása 70 °C-on 1,3 MPa-nál (13 bar) nem nagyobb, és sűrűsége 50 °C-on a diklór-fluor-metánénál (1,30 kg/l) nem kisebb; F2 keverék, amelynek gőznyomása 70 °C-on 1,9 MPa-nál (19 bar) nem nagyobb, és sűrűsége 50 °C-on a diklór-difluor-metánénál (1,21 kg/l) nem kisebb; F3 keverék, amelynek gőznyomása 70 °C-on 3 MPa-nál (30 bar) nem nagyobb, és sűrűsége 50 °C-on a klór-difluor-metánénál (1,09 kg/l) nem kisebb. <b>Megjegyzés:</b> A triklór-monofluor-metán (R 11 hűtőgáz), az 1,1,2-triklór-1,2,2-trifluor-etán (R 113 hűtőgáz), az 1,1,1-triklór-2,2,2-trifluor-etán (R 113a hűtőgáz), az 1-klór-1,2,2-trifluor-etán (R 133 hűtőgáz) és az 1-klór-1,1,2-trifluor-etán (R 133b hűtőgáz) nem a 2 osztály anyaga, az F1, F2, F3 keverékekben azonban előfordulhatnak.
	1968	ROVARIRTÓ GÁZ, M.N.N.
	3163	CSEPPFOLYÓSÍTOTT GÁZ, M.N.N.
2O	3157	CSEPPFOLYÓSÍTOTT GÁZ, GYÚJTÓ HATÁSÚ, M.N.N.
2 F	1010	BUTADIÉNEK ÉS SZÉNHIDROGÉN KEVERÉKE, STABILIZÁLT, amelynek gőznyomása 70 °C-on nem haladja meg az 1,1 MPa-t (11 bar-t) és sűrűsége 50 °C-on legalább 0,525 kg/l <b>Megjegyzés:</b> A stabilizált butadiének is az UN 1010 alá vannak besorolva, lásd a 3.2 fejezet „A” táblázatát.

Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
2F (folyt.)	1060	<p>METIL-ACETILÉN ÉS PROPADIÉN KEVERÉK, STABILIZÁLT</p> <p>mint a metil-acetilén és propadién keveréke szénhidrogénnel, azaz:</p> <p>P1 keverék legfeljebb 63 térf.% metil-acetilén és propadién, és legfeljebb 24 térf.% propán és propén tartalommal, a telített C<sub>4</sub>-szénhidrogén részarányának legalább 14 térf.%-nak kell lennie; és</p> <p>P2 keverék legfeljebb 48 térf.% metil-acetilén és propadién, és legfeljebb 50 térf.% propán és propén tartalommal, a telített C<sub>4</sub>-szénhidrogén részarányának legalább 5 térf.%-nak kell lennie; valamint</p> <p>propadién keverékei 1...4% metil-acetilénnel.</p>
	1965	<p>SZÉNHIDROGÉN-GÁZ KEVERÉK, CSEPPFOLYÓSÍTOTT, M.N.N.</p> <p>keverékek, mint:</p> <p>A gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg az 1,1 MPa-t (11 bar-t), és sűrűsége 50 °C-on 0,525 kg/l-nél nem kisebb</p> <p>A01 gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg az 1,6 MPa-t (16 bar-t), és sűrűsége 50 °C-on 0,516 kg/l-nél nem kisebb</p> <p>A02 gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg az 1,6 MPa-t (16 bar-t), és sűrűsége 50 °C-on 0,505 kg/l-nél nem kisebb</p> <p>A0 gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg az 1,6 MPa-t (16 bar-t), és sűrűsége 50 °C-on 0,495 kg/l-nél nem kisebb</p> <p>A1 gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg a 2,1 MPa-t (21 bar-t), és sűrűsége 50 °C-on 0,485 kg/l-nél nem kisebb</p> <p>B1 gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg a 2,6 MPa-t (26 bar-t), és sűrűsége 50 °C-on 0,474 kg/l-nél nem kisebb</p> <p>B2 gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg a 2,6 MPa-t (26 bar-t), és sűrűsége 50 °C-on 0,463 kg/l-nél nem kisebb</p> <p>B gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg a 2,6 MPa-t (26 bar-t), és sűrűsége 50 °C-on 0,450 kg/l-nél nem kisebb</p> <p>C gázkeverék, amelynek gőznyomása 70 °C-on nem haladja meg a 3,1 MPa-t (31 bar-t), és sűrűsége 50 °C-on 0,440 kg/l-nél nem kisebb.</p> <p><b>Megjegyzés: 1.</b> Az előbbi gázkeverékek megnevezésére a kereskedelembe szokásos következő elnevezések is használhatók: A, A01, A02 és A0 keverék esetén BUTÁN, C gázkeverék esetén PROPÁN.</p>

Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
2F (folyt.)		2. A tengeri vagy légi szállítást megelőző és követő szállításnál az UN 1965 SZÉNHIDROGÉN-GÁZ KEVERÉK, CSEPPFOLYÓSÍTOTT, M.N.N. helyett választható az UN 1075 PETRÓLEUMGÁZ, CSEPPFOLYÓSÍTOTT tétel is.

**2.2.3 3 osztály Gyúlékony folyékony anyagok****2.2.3.1 Kritériumok****2.2.3.1.1** A 3 osztály fogalomköre olyan anyagokra és ezen osztály anyagait tartalmazó tárgyakra terjed ki, amelyek

- az 1.2.1 szakaszban a „folyékony anyag” meghatározás a) bekezdése szerint folyékonyak;
- gőznyomásuk 50 °C hőmérsékleten legfeljebb 300 kPa (3 bar) és 20 °C hőmérsékleten, 101,3 kPa normál nyomáson nem teljesen gáz alakúak;
- lobbanáspontjuk legfeljebb 60 °C (a vizsgálatra lásd a 2.3.3.1 bekezdést).

A 3 osztály fogalomköre kiterjed az olyan gyúlékony folyékony anyagokra és olvasztott szilárd anyagokra is, amelyek lobbanáspontja meghaladja a 60 °C-ot és amelyeket lobbanáspontjukkal megegyező vagy annál magasabb hőmérsékletre melegítve szállítanak vagy adnak át szállításra. Ezek az anyagok az UN 3256 tétel alá vannak besorolva.

A 3 osztály fogalomköre kiterjed a folyékony, érzéketlenített robbanóanyagokra is. A folyékony, érzéketlenített robbanóanyagok olyan robbanóanyagok, amelyek vízben vagy más folyadékban vannak oldva vagy szuszpendálva azért, hogy homogén folyékony keveréket képezve robbanó tulajdonságaikat elnyomják. A 3.2 fejezet „A” táblázatában ilyen tétel az UN 1204, 2059, 3064, 3343, 3357 és 3379.

**Megjegyzés:** 1. Nem tartoznak a 3 osztályba azok a 35 °C feletti lobbanáspontú, nem mérgező és nem maró anyagok, amelyek a „Vizsgálatok és kritériumok kézikönyv” III. rész 32.2.5 bekezdés kritériumai alapján nem égést fenntartóak; ha azonban az ilyen anyagokat lobbanáspontjukkal megegyező vagy annál magasabb hőmérsékletre melegítve szállítják vagy adják át szállításra, akkor a 3 osztály anyagai.

2. Az előző 2.2.3.1.1 ponttól eltérően a dízelolajat, a gázolajat és a könnyű fűtőolajat 60 °C feletti, de legfeljebb 100 °C lobbanásponttal a 3 osztály UN 1202 számú anyagának kell tekinteni.
3. Azok a folyékony anyagok, amelyek lobbanáspontja 23 °C alatt van és belélegzés esetén nagyon mérgezőek, valamint azok, amelyek lobbanáspontja 23 °C vagy annál magasabb és mérgezőek, a 6.1 osztály anyagai (lásd a 2.2.61.1 bekezdést).
4. Azok a peszticidként használt gyúlékony folyékony anyagok és készítmények, amelyek nagyon mérgezők, mérgezők vagy enyhén mérgezők és lobbanáspontjuk 23 °C vagy annál magasabb, a 6.1 osztály anyagai (lásd a 2.2.61.1 bekezdést).

**2.2.3.1.2** A 3 osztály anyagai és tárgyai a következők szerint vannak csoportosítva:

F Gyúlékony folyékony anyagok járulékos veszély nélkül:

F1 Gyúlékony folyékony anyagok 60 °C vagy annál alacsonyabb lobbanásponttal

F2 60 °C feletti lobbanáspontú folyékony anyagok, amelyeket lobbanáspontjukkal megegyező vagy annál magasabb hőmérsékletre melegítve szállítanak vagy adnak fel szállításra (magas hőmérsékletű anyagok)

FT Gyúlékony folyékony anyagok, amelyek mérgezők:

FT1 Gyúlékony folyékony anyagok, amelyek mérgezők

FT2 Peszticidek

FC Gyúlékony folyékony anyagok, amelyek marók

FTC Gyúlékony folyékony anyagok, amelyek mérgezők és marók

D Folyékony, érzéketlenített robbanóanyagok.

#### 2.2.3.1.3

A 3 osztályba sorolt anyagokat és tárgyakat a 3.2 fejezet „A” táblázata sorolja fel. A 3.2 fejezet „A” táblázatában név szerint nem említett anyagokat a 2.2.3.3 bekezdés megfelelő tételéhez és a megfelelő csomagolási csoportba kell sorolni, ezen bekezdés előírásai szerint. A gyúlékony folyékony anyagokat a szállítás során általuk képviselt veszély mértéke alapján a következő csomagolási csoportok egyikéhez kell hozzárendelni:

	Lobbanáspont (zárttéri)	Forráskezdet
I	–	$\leq 35\text{ °C}$
II <sup>a)</sup>	$< 23\text{ °C}$	$> 35\text{ °C}$
III <sup>a)</sup>	$\geq 23\text{ °C}$ és $\leq 60\text{ °C}$	$> 35\text{ °C}$

a) Lásd a 2.2.3.1.4 pontot is.

Járulékos veszéllyel (veszélyekkel) rendelkező folyékony anyagok esetében az előző táblázat alapján meghatározott csomagolási csoportot és a járulékos veszély(ek) fokozata alapján adódó csomagolási csoportot is tekintetbe kell venni, ezek alapján az osztályt és a csomagolási csoportot a 2.1.3.10 bekezdés veszélyességi rangsor táblázata szerint kell meghatározni.

#### 2.2.3.1.4

A folyékony vagy viszkózus keverékeket és készítményeket, beleértve a legfeljebb 20% nitrocellulóz tartalmú keverékeket is, amelyek nitrogéntartalma 12,6%-nál nem több (száraz tömegre vetítve), csak akkor lehet a III csomagolási csoportba sorolni, ha a következő követelményeket kielégítik:

a) az oldószer-szétválási próba során a szétváló oldószer réteg magassága a minta teljes magasságának 3%-ánál kisebb (lásd a „Vizsgálatok és kritériumok kézikönyv” III. Rész, 32.5.1 bekezdését); és

b) a viszkozitás<sup>3)</sup> és a lobbanáspont a táblázatnak megfelelő:

Extrapolált kinematikai viszkozitás, $\nu$ (0-hoz közelítő nyírósebességnél, $23\text{ °C-on}$ ), $\text{mm}^2/\text{s}$	A kifolyási idő, $t$ ISO 2431:1993 szerint		Lobbanáspont, $^{\circ}\text{C}$
	s	A kifolyónyílás átmérője, mm	
$20 < \nu \leq 80$	$20 < t \leq 60$	4	17 felett
$80 < \nu \leq 135$	$60 < t \leq 100$	4	10 felett
$135 < \nu \leq 220$	$20 < t \leq 32$	6	5 felett
$220 < \nu \leq 300$	$32 < t \leq 44$	6	–1 felett
$300 < \nu \leq 700$	$44 < t \leq 100$	6	–5 felett
$700 < \nu$	$100 < t$	6	–5 és alatta

**Megjegyzés:** A 20%-nál több, de legfeljebb 55% nitrocellulózt tartalmazó keverékek, amelynek nitrogéntartalma 12,6%-nál nem több (száraz anyagra vetítve), az UN 2059 szám alá tartoznak.

3) **A viszkozitás meghatározása:** Ha a szóban forgó anyag nemnewtoni folyadék, vagy a viszkozitás kifolyópohárral nem határozható meg, változó nyírósebességű viszkoziméterrel meg kell határozni az anyag dinamikai viszkozitását  $23\text{ °C-on}$ , különböző nyírósebességekre, majd az így kapott, nyírósebességtől függő értékekből a 0 nyírósebességre kell extrapolálni. Az így kapott dinamikai viszkozitás és a sűrűség hányadosa adja a látszólagos kinematikai viszkozitást a 0-hoz közelítő nyírósebességnél.

*A 23 °C-nál alacsonyabb lobbanáspontú keverékek*

- több mint 55% nitrocellulóz-tartalommal, bármilyen nitrogéntartalom esetén, vagy
- legfeljebb 55% nitrocellulóz-tartalommal és 12,6%-nál nagyobb nitrogéntartalom esetén (száraz anyagra vetítve)

az 1 osztály (UN 0340 vagy 0342) vagy a 4.1 osztály (UN 2555, 2556 vagy 2557) anyagai.

**2.2.3.1.5** A nem mérgező, nem maró és környezetre nem veszélyes oldatok és a homogén keverékek, amelyek lobbanáspontja 23 °C vagy ennél magasabb (viszkózus anyagok, mint pl. némely festékek és zománcok, kivéve a 20%-nál nagyobb nitrocellulóz tartalmú anyagokat), 450 litert meg nem haladó tartályokba csomagolva nem esnek a RID előírásainak hatálya alá, ha oldószer-szétválási próba (lásd a „Vizsgálatok és kritériumok kézikönyv” III. rész 32.5.1 bekezdését) során a szétvált oldószer réteg magassága kisebb, mint a teljes mintamagasság 3%-a, és ha 23 °C-on az ISO 2431:1993 szabvány szerinti 6 mm átmérőjű kifolyónyílással ellátott kifolyópohárból a kifolyás időtartama:

- a) legalább 60 s, vagy
- b) legalább 40 s, és nem tartalmaz a 3 osztályba tartozó anyagokból 60%-nál többet.

**2.2.3.1.6** Ha a 3 osztály anyagai valamilyen adalékanyag hozzáadása révén eltérő veszélyességi kategóriába kerülnek át, mint ahová a 3.2 fejezet „A” táblázatában név szerint említett anyagok tartoznak, ezeket a keverékeket vagy oldatokat azok alá a tételek alá kell besorolni, ahová tényleges veszélyességük mértéke alapján tartoznak.

***Megjegyzés:** Az oldatok és keverékek (készítmények és hulladékok) osztályozására lásd a 2.1.3 szakaszt is.*

**2.2.3.1.7** A 2.3.3.1 bekezdés és a 2.3.4 szakasz szerinti vizsgálati eljárások és a 2.2.3.1.1 pontban található kritériumok alapján az is meghatározható, hogy egy név szerint feltüntetett (vagy név szerint feltüntetett anyagot tartalmazó) oldat vagy keverék természete olyan, hogy az oldat vagy keverék nem esik ezen osztály előírásainak hatálya alá (lásd a 2.1.3 szakaszt is).

**2.2.3.2** *A fuvarozásból kizárt anyagok*

**2.2.3.2.1** A 3 osztályba tartozó olyan anyagok, amelyek könnyen peroxidálódnak (mint az éter vagy bizonyos heterociklikus, oxigéntartalmú anyagok), nem fogadhatók el fuvarozásra, ha peroxid-tartalmuk – hidrogén-peroxidra (H<sub>2</sub>O<sub>2</sub>-re) számítva – meghaladja a 0,3%-ot. A peroxid-tartalmat a 2.3.3.2 bekezdésben foglaltak szerint kell meghatározni.

**2.2.3.2.2** A 3 osztály vegyileg nem állandó anyagai csak akkor adhatók át fuvarozásra, ha megtették a szükséges intézkedéseket a fuvarozás alatt bekövetkező veszélyes bomlás vagy polimerizáció megakadályozására. Ezért különösen arról kell gondoskodni, hogy a tartályok és tartányok ne tartalmazzanak olyan anyagokat, amelyek az ilyen reakciókat elősegítik.

**2.2.3.2.3** Azok a folyékony, érzéketlenített robbanóanyagok, amelyek a 3.2 fejezet „A” táblázatában nincsenek feltüntetve, a 3 osztály anyagaiként nem fogadhatók el fuvarozásra.

### 2.2.3.3 A gyűjtőmegnevezések felsorolása

Járolékos - veszély	Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
<b>Gyúlékony, folyékony anyagok</b>			
Járolékos veszély nélküli anyagok	F1		1133 RAGASZTÓK gyúlékony folyadék tartalommal 1136 GYÚLÉKONY KÖSZÉNKÁTRÁNY PÁRLATOK 1139 BEVONÓ OLDAT (beleértve az ipari vagy más célokra használt felületkezelő vagy bevonóanyagokat, pl. alapozó festékeket jármű karosszériához, hordóbélelő anyagokat) 1169 FOLYÉKONY AROMÁS KIVONATOK 1197 FOLYÉKONY ÍZANYAG KIVONATOK 1210 NYOMDAFESTÉK, gyúlékony vagy 1210 NYOMDAFESTÉK SEGÉDANYAG (beleértve a festékhígítókat és oldószereket), gyúlékony 1263 FESTÉK (beleértve a festéket, lakkot, zománcot, sellakot, kencét, polírozót, folyékony töltőanyagot és folyékony lakkbázist) vagy 1263 FESTÉK SEGÉDANYAGOK (beleértve a festékhígítót vagy oldószert) 1266 PARFÜM KÉSZÍTMÉNYEK gyúlékony oldószerekkel 1293 GYÓGYÁSZATI TINKTÚRÁK 1306 FOLYÉKONY FAKONZERVÁLÓ ANYAGOK 1866 GYANTA OLDAT, gyúlékony 1999 FOLYÉKONY KÁTRÁNYOK, beleértve az útépitésre használt kátrányolajokat, bitument és hígított bitumeneket 3065 ALKOHOLOS ITALOK 3269 POLIÉSZTER-GYANTA KÉSZLET 1224 FOLYÉKONY KETONOK, M.N.N. 1268 NYERSOLAJ PÁRLATOK, M.N.N. vagy 1268 NYERSOLAJ TERMÉKEK, M.N.N. 1987 ALKOHOLOK, M.N.N. 1989 ALDEHIDEK, M.N.N. 2319 TERPÉN SZÉNHIDROGÉNEK, M.N.N. 3271 ÉTEREK, M.N.N. 3272 ÉSZTEREK, M.N.N. 3295 FOLYÉKONY SZÉNHIDROGÉNEK, M.N.N. 3336 FOLYÉKONY, GYÚLÉKONY MERKAPTÁNOK, M.N.N. vagy 3336 FOLYÉKONY, GYÚLÉKONY MERKAPTÁN KEVERÉK, M.N.N. 1993 GYÚLÉKONY FOLYÉKONY ANYAG, M.N.N.

Folyékony, érzéketlenített robbanóanyagok	D	3343	NITROGLICERIN KEVERÉK, ÉRZÉKETLENÍTETT, FOLYÉKONY, GYÚLÉKONY, M.N.N., legfeljebb 30 tömeg% nitroglicerintartalommal
		3357	NITROGLICERIN KEVERÉK, ÉRZÉKETLENÍTETT, FOLYÉKONY, M.N.N., legfeljebb 30 tömeg% nitroglicerintartalommal
		3379	FOLYÉKONY, ÉRZÉKETLENÍTETT ROBBANÓANYAG, M.N.N.

**2.2.41            4.1 osztály      Gyúlékony szilárd anyagok, önreaktív anyagok és szilárd, érzéketlenített robbanóanyagok**

**2.2.41.1            *Kritériumok***

**2.2.41.1.1**      A 4.1 osztály fogalomköre a gyúlékony anyagokra és tárgyakra, az érzéketlenített robbanóanyagokra, amelyek az 1.2.1 szakaszban a „szilárd anyag” meghatározás a) bekezdése szerint szilárdak, valamint a szilárd vagy folyékony önreaktív anyagokra terjed ki.

A következők tartoznak a 4.1 osztályba:

- könnyen gyulladó szilárd anyagok és tárgyak (lásd a 2.2.41.1.3 – 2.2.41.1.8 pontot);
- szilárd és folyékony önreaktív anyagok (lásd a 2.2.41.1.9 – 2.2.41.1.16 pontot);
- szilárd, érzéketlenített robbanóanyagok (lásd a 2.2.41.1.18 pontot);
- önreaktív anyagokkal rokon anyagok (lásd a 2.2.41.1.19 pontot).

**2.2.41.1.2**      A 4.1 osztály anyagai és tárgyai a következők szerint vannak csoportosítva:

F      Gyúlékony szilárd anyagok járulékos veszély nélkül:

- F1      Szerves anyagok
- F2      Szerves anyagok olvasztott állapotban
- F3      Szervetlen anyagok

FO      Gyúlékony szilárd anyagok, amelyek gyújtó hatásúak

FT      Gyúlékony szilárd anyagok, amelyek mérgezőek:

- FT1      Szerves, mérgező anyagok
- FT2      Szervetlen, mérgező anyagok

FC      Gyúlékony szilárd anyagok, amelyek maróak:

- FC1      Szerves, maró anyagok
- FC2      Szervetlen, maró anyagok

D      Szilárd, érzéketlenített robbanóanyagok, járulékos veszély nélkül

DT      Szilárd, érzéketlentett robbanóanyagok, amelyek mérgezőek

SR      Önreaktív anyagok:

- SR1      Önreaktív anyagok hőmérséklet-szabályozási igény nélkül
- SR2      Önreaktív anyagok hőmérséklet-szabályozási igénnyel (a vasúti fuvarozásból ki vannak zárva).

***Gyúlékony szilárd anyagok***

***Meghatározások és tulajdonságok***

**2.2.41.1.3**      A *gyúlékony szilárd anyagok* a könnyen gyulladó szilárd anyagok és azok, amelyek súrlódás révén tüzet okozhatnak.

A *könnyen gyulladó szilárd anyagok* porszerűek, szemcsések vagy pasztaszerűek, és csak akkor veszélyesek, ha a gyújtóforrással, pl. égő gyufával való rövid érintkezéssel könnyen meggyújthatók és a láng gyorsan terjed. A veszélyt nemcsak a tűz jelentheti, hanem a mérgező égéstermékek is. A fémporok különösen azért veszélyesek, mert nehéz a tüzet

eloltani, mivel a szokásos oltószerek, mint a szén-dioxid vagy a víz növelhetik a veszélyt.

#### *Besorolás*

**2.2.41.1.4** A 4.1 osztály gyúlékony szilárd anyagai közé sorolt anyagokat és tárgyakat a 3.2 fejezet „A” táblázata sorolja fel. A 3.2 fejezet „A” táblázatában név szerint nem említett szerves anyagok és tárgyak besorolása a 2.1 fejezet előírásai szerint a 2.2.41.3 bekezdés megfelelő tétele alá tapasztalatok alapján vagy a „Vizsgálatok és kritériumok kézikönyv” III. rész 33.2.1 bekezdése szerinti vizsgálati eljárások eredményei alapján történhet. A 3.2 fejezet „A” táblázatában név szerint nem említett szervetlen anyagok besorolásának a „Vizsgálatok és kritériumok kézikönyv” III. rész 33.2.1 bekezdése szerinti vizsgálati eljárások eredményei alapján kell történnie; a tapasztalatokat is figyelembe kell azonban venni, ha azok szigorúbb hozzárendeléshez vezetnének.

**2.2.41.1.5** A név szerint nem említett anyagoknak a „Vizsgálatok és kritériumok kézikönyv” III. rész 33.2.1 bekezdése szerinti vizsgálati eljárások eredményei alapján a 2.2.41.3 bekezdés valamely tétel alá történő besorolásánál a következő kritériumokat kell alkalmazni:

- a) A fémporok és a fémötvözet-porok kivételével a porszerű, szemcsés vagy pasztaszerű anyagokat akkor kell a 4.1 osztályba könnyen gyulladó anyagnak besorolni, ha azok gyújtóforrással (pl. égő gyufával) való rövid érintkezés hatására könnyen meggyulladnak, vagy ha meggyulladás esetén a láng gyorsan terjed, az égési idő 100 mm mérési távolságon kevesebb 45 s-nál vagy az égési sebesség nagyobb mint 2,2 mm/s.
- b) A fémporokat és a fémötvözet-porokat akkor kell a 4.1 osztályba sorolni, ha lánggal meggyújthatók és a reakció 10 percen belül a minta teljes hosszára kiterjed.

Azokat a szilárd anyagokat, amelyek sűrűdés révén tüzet okozhatnak, valamely meglévő tételhez (pl. gyufához) való hasonlóság alapján, vagy valamely, ráillő különleges előírás alapján kell a 4.1 osztályba sorolni.

**2.2.41.1.6** A „Vizsgálatok és kritériumok kézikönyv” III. rész 33.2.1 bekezdése szerinti vizsgálati eljárások, valamint a 2.2.41.1.4 és a 2.2.41.1.5 pontban található kritériumok alapján az is meghatározható, hogy egy név szerint feltüntetett anyag természete olyan, hogy az anyag nem esik ezen osztály előírásainak hatálya alá.

**2.2.41.1.7** Ha a 4.1 osztály anyagai valamilyen adalékanyag hozzáadása révén eltérő veszélyességi kategóriába kerülnek át, mint ahová a 3.2 fejezet „A” táblázatában név szerint említett anyagok tartoznak, ezeket a keverékeket azok alá a tételek alá kell besorolni, ahová tényleges veszélyességük mértéke alapján tartoznak.

**Megjegyzés:** Az oldatok és keverékek (készítmények és hulladékok) besorolásához lásd a 2.1.3 szakaszt.

#### *Csomagolási csoporthoz való hozzárendelés*

**2.2.41.1.8** A 3.2 fejezet „A” táblázatának egyes tételei alá sorolt gyúlékony szilárd anyagokat a „Vizsgálatok és kritériumok kézikönyv” III. rész 33.2.1 bekezdése szerinti vizsgálati eljárások alapján a II vagy a III csomagolási csoportba kell sorolni, a következő kritériumok szerint:

- a) A könnyen gyulladó szilárd anyagokat, amelyeknél a vizsgálat során az égési idő 100 mm mérési távolságon 45 s-nál kevesebb:
  - a II csomagolási csoportba kell sorolni akkor, ha a láng áthalad a nedvesített zónán;
  - a III csomagolási csoportba kell sorolni akkor, ha a nedvesített zóna legalább négy

percre megállítja a láng terjedését.

b) A fémporokat és fémötvözet-porokat:

a II csomagolási csoportba kell sorolni akkor, ha a vizsgálat során a reakció öt percen belül az egész mintára kiterjed;

a III csomagolási csoportba kell sorolni akkor, ha a vizsgálat során a reakció csak öt percen túl terjed ki az egész mintára.

Azokat a szilárd anyagokat, amelyek sűrűlódás révén tüzet okozhatnak, valamely meglévő tételhez való hasonlóság, vagy valamely különleges előírás alapján kell valamely csomagolási csoporthoz hozzárendelni.

### **Önreaktív anyagok**

#### *Meghatározások*

#### **2.2.41.1.9**

A RID alkalmazásában az önreaktív anyagok termikusan instabil anyagok, amelyek hajlamosak az erős exoterm bomlásra még oxigén (levegő) részvétele nélkül is. Nem tekinthetők a 4.1 osztály önreaktív anyagainak azok az anyagok, amelyek:

- a) az 1 osztály kritériumai szerint robbanóanyagok;
- b) az 5.1 osztály besorolási eljárása szerint gyújtó hatású anyagok (lásd a 2.2.51.1 bekezdést), kivéve a gyújtó hatású anyagok olyan keverékeit, amelyek 5% vagy annál több éghető szerves anyagot tartalmaznak, mivel ezeket a 2. megjegyzésben szereplő elv szerint kell besorolni;
- c) az 5.2 osztály kritériumai szerint szerves peroxidok (lásd a 2.2.52.1 bekezdést);
- d) bomláshője nem éri el a 300 J/g-ot; vagy
- e) öngyorsuló bomlási hőmérséklete (ÖBH) (lásd a 3. megjegyzést) 50 kg-os küldeménydarab esetén meghaladja a 75 °C-ot.

**Megjegyzés:** 1. A bomláshő bármely nemzetközileg elfogadott módszerrel, pl. differenciál kaloriméteres (DSC) méréssel és adiabatikus kalorimetriával meghatározható.

2. Az 5.1 osztály kritériumainak megfelelő gyújtó hatású anyagok keverékeit, amelyek 5% vagy annál több éghető szerves anyagot tartalmaznak, és amelyek nem elégitik ki az előző a), c), d) vagy e) pont kritériumait, az önreaktív anyagok besorolási eljárása szerint meg kell vizsgálni.

Ha a keverék B – F típusú önreaktív anyag jellemzőivel rendelkezik, akkor a 4.1 osztályba kell sorolni.

Ha a keverék a „Vizsgálatok és kritériumok kézikönyv” II. Rész 20.40.3 g) bekezdése alapján G típusú anyag jellemzőivel rendelkezik, akkor az 5.1 osztály kritériumai szerint kell besorolni (lásd a 2.2.51.1 bekezdést).

3. Az öngyorsuló bomlási hőmérséklet (ÖBH) az a legalacsonyabb hőmérséklet, amelynél öngyorsuló bomlás mehet végbe az anyagban a szállításra használt csomagolásban. Az ÖBH meghatározására vonatkozó előírásokat a „Vizsgálatok és kritériumok kézikönyv” II. rész 20. fejezete és a 28.4 bekezdése tartalmazza.

4. Bármely anyagot, ami az önreaktív anyag tulajdonságait mutatja, mint ilyent kell besorolni, még ha az anyag a 2.2.42.1.5 pont szerinti vizsgálatban a 4.2 osztályba történő besoroláshoz pozitív eredményt adott is.

*Tulajdonságok*

- 2.2.41.1.10** Az önreaktív anyagok bomlása hővel, katalitikus szennyeződésekkel való érintkezéssel (pl. savak, nehézfém vegyületek, bázisok), súrlódással vagy ütéssel iniciálható. A bomlás sebessége a hőmérséklettel növekszik és az anyagtól függően változik. A bomlás, különösen ha nem történik meggyulladás, mérgező gázok vagy gőzök fejlődésével járhat. Egyes önreaktív anyagok hőmérséklet-szabályozást igényelnek. Egyes önreaktív anyagok, különösen zárt térben, robbanásszerűen elbomolhatnak. Ezek a jellemzők hígítók hozzáadásával vagy megfelelő csomagolások használatával módosíthatók. Némely önreaktív anyag élénken ég. Önreaktív anyagok például a következő típusú vegyületek:

alifás azovegyületek ( $-C-N=N-C-$ );  
szerves azidok ( $-C-N_3$ );  
diazónium sók ( $-CN_2^+Z^-$ );  
N-nitrózo vegyületek ( $-N-N=O$ ); és  
aromás szulfhidrazidok ( $-SO_2-NH-NH_2$ ).

Ez a felsorolás nem teljes, más reaktív csoportot tartalmazó anyagok és az anyagok egyes keverékei hasonló tulajdonságokkal rendelkezhetnek.

*Besorolás*

- 2.2.41.1.11** Az önreaktív anyagok a veszély mértéke alapján hét típusba vannak sorolva. Az önreaktív anyagok típusai az A típustól, amely abban a csomagolásban, amelyben bevizsgálásra került, nem szállítható, egészen a G típusig tartanak, amely nem esik a 4.1 osztály előírásainak hatálya alá. A B-től F-ig terjedő típusok alá való besorolás az egy csomagolásban engedélyezett legnagyobb mennyiségtől függ. Az anyagok besorolásához alkalmazandó elveket, besorolási eljárásokat, vizsgálati módszereket és kritériumokat, valamint a megfelelő vizsgálati jegyzőkönyvre példát a „Vizsgálatok és kritériumok kézikönyv” II. Rész tartalmazza.

- 2.2.41.1.12** A már besorolt és csomagolóeszközben való szállításra már engedélyezett önreaktív anyagokat a 2.2.41.4 bekezdés, az IBC-ben való szállításra már engedélyezett önreaktív anyagokat a 4.1.4.2 bekezdés IBC520 csomagolási utasítása, és a 4.2 fejezet szerint tartányban szállítható önreaktív anyagokat a 4.2.5.2 bekezdés T23 mobil tartány utasítása sorolja fel. Ezekben a felsorolásokban minden engedélyezett anyag a 3.2 fejezet „A” táblázatának valamely generikus tételéhez (UN 3221 – 3240) hozzá van rendelve, és meg vannak adva a szállítás szempontjából fontos információt jelentő járulékos veszélyek, ill. megjegyzések.

A gyűjtőmegnevezések meghatározzák:

- az önreaktív anyag típusát (B – F), lásd az előző 2.2.41.1.11 pontot;
- a fizikai állapotot (folyékony/szilárd).

A 2.2.41.4 bekezdésben felsorolt önreaktív anyagok besorolása technikailag tiszta anyagokon alapul (kivéve ahol 100%-nál kisebb koncentráció van megadva).

- 2.2.41.1.13** A 2.2.41.4 bekezdésben, a 4.1.4.2 bekezdés IBC520 csomagolási utasításában, ill. a 4.2.5.2 bekezdés T23 mobil tartány utasításában fel nem sorolt önreaktív anyagok besorolását és valamely gyűjtőmegnevezéshez való hozzárendelését a vizsgálati jegyzőkönyv alapján a származási ország illetékes hatóságának kell elvégeznie. A jóváhagyásnak tartalmaznia kell a besorolást és a szállítási feltételeket. Ha a származási ország nem valamely COTIF Tagállam, a besorolást és a szállítási feltételeket a küldemény által érintett első COTIF Tagállam illetékes hatóságának kell elismernie.

- 2.2.41.1.14** Egyes önreaktív anyagokhoz aktivátorok, pl. cinkvegyületek adhatók reaktivitásuk

megváltoztatására. Az aktivátor típusától és koncentrációjától függően ez a termikus stabilitás csökkenéséhez és a robbanó tulajdonságok változásához vezethet. Ha ezen tulajdonságok bármelyike is megváltozik, az új készítményt a besorolási eljárás szerint újra kell értékelni.

**2.2.41.1.15** A 2.2.41.4 bekezdésben fel nem sorolt önreaktív anyag vagy önreaktív anyag készítmény mintákat, amelyekre nézve nem áll rendelkezésre teljes körű vizsgálati eredmény és szállításuk további vizsgálatok vagy értékelés céljából történik, a C típusú önreaktív anyagokra vonatkozó, megfelelő tételhez kell hozzárendelni, feltéve, hogy a következő feltételeknek megfelelnek:

- a rendelkezésre álló adatokból kitűnik, hogy a minta nem veszélyesebb, mint egy B típusú önreaktív anyag;
- a minta az OP2 csomagolási módszernek megfelelően van csomagolva és mennyisége kocsinként nem haladja meg a 10 kg-ot.

A hőmérséklet-szabályozást igénylő minták a vasúti fuvarozásból ki vannak zárva.

#### *Érzéketlenítés*

**2.2.41.1.16** A biztonságos szállítás céljából az önreaktív anyagokat számos esetben hígítók használatával érzéketlenítik. Amennyiben valamely anyag százalékos tartalma meg van határozva, ez a tartalom tömegére vonatkozik, egész számra kerekítve. Hígító használata esetén az önreaktív anyagot a szállítás során használt koncentrációjú és formájú hígító jelenléte mellett kell vizsgálni. Olyan hígítók, amelyek a küldeménydarabból való kifolyás esetén lehetővé teszik, hogy az önreaktív anyag veszélyes mértékben koncentrálódhasson, nem használhatók. A használt hígítónak az önreaktív anyaggal összeférhetőnek kel lennie. Ebben a tekintetben összeférhető hígítók azok a szilárd vagy folyékony anyagok, amelyek nem befolyásolják hátrányosan az önreaktív anyag termikus stabilitását és veszélytípusát.

**2.2.41.1.17** (fenntartva)

#### *Szilárd, érzéketlenített robbanóanyagok*

**2.2.41.1.18** A szilárd, érzéketlenített robbanóanyagok olyan anyagok, amelyeket vízzel vagy alkohollal nedvesítenek vagy más anyagokkal hígítanak azért, hogy robbanó tulajdonságaikat elnyomják. A 3.2 fejezet „A” táblázatában ilyen tétel az UN 1310, 1320, 1321, 1322, 1336, 1337, 1344, 1347, 1348, 1349, 1354, 1355, 1356, 1357, 1517, 1571, 2555, 2556, 2557, 2852, 2907, 3317, 3319, 3344, 3364, 3365, 3366, 3367, 3368, 3369, 3370, 3376, 3380 és 3474.

#### *Önreaktív anyagokkal rokon anyagok*

**2.2.41.1.19** Azok az anyagok,

- a) amelyeket az 1 és 2 vizsgálati sorozat eredményei alapján ideiglenesen az 1 osztályba soroltak, de a 6. vizsgálati sorozat alapján mentesülnek az 1 osztály alól;
- b) amelyek nem a 4.1 osztály önreaktív anyagai; és
- c) amelyek nem az 5.1 vagy az 5.2 osztály anyagai;

szintén a 4.1 osztályba tartoznak. Ilyen tételek az UN 2956, 3241, 3242 és 3251.

**2.2.41.2** *A fuvarozásból kizárt anyagok*

**2.2.41.2.1** A 4.1 osztályba tartozó, vegyileg nem állandó anyagok csak akkor adhatók át fuvarozásra, ha megtették a szükséges intézkedéseket a szállítás alatt bekövetkező veszélyes bomlás vagy

polimerizáció megakadályozására. Ezért különösen arról kell gondoskodni, hogy a tartályok és tartályok ne tartalmazzanak olyan anyagokat, amelyek az ilyen reakciókat elősegítik.

**2.2.41.2.2** Az UN 3097 számú gyújtó hatású, gyúlékony, szilárd anyagok a fuvarozásból ki vannak zárva, kivéve, ha megfelelnek az 1 osztály előírásainak (lásd a 2.1.3.7 bekezdést is).

**2.2.41.2.3** A következő anyagok a fuvarozásból ki vannak zárva:

- az A típusú önreaktív anyagok [lásd a „Vizsgálatok és kritériumok kézikönyv” II. rész, 20.4.2 a) bekezdését];
- a fehér- vagy sárgafoszfortól nem mentes foszfor-szulfidok;
- a 3.2 fejezet „A” táblázatában fel nem sorolt szilárd, érzéketlenített robbanóanyagok;
- a szervetlen, gyúlékony anyagok olvasztott formában, kivéve az UN 2448 olvasztott ként.

A következő anyagok a vasúti fuvarozásból ki vannak zárva:

- az 50 tömeg%-nál kevesebb vízzel nedvesített bárium-azid;
- legfeljebb 55 °C ÖBH-val rendelkező, vagyis hőmérséklet-szabályozást igényelő önreaktív anyagok:

3231 B típusú önreaktív folyékony anyag hőmérséklet-szabályozással

3232 B típusú önreaktív szilárd anyag hőmérséklet-szabályozással

3233 C típusú önreaktív folyékony anyag hőmérséklet-szabályozással

3234 C típusú önreaktív szilárd anyag hőmérséklet-szabályozással

3235 D típusú önreaktív folyékony anyag hőmérséklet-szabályozással

3236 D típusú önreaktív szilárd anyag hőmérséklet-szabályozással

3237 E típusú önreaktív folyékony anyag hőmérséklet-szabályozással

3238 E típusú önreaktív szilárd anyag hőmérséklet-szabályozással

3239 F típusú önreaktív folyékony anyag hőmérséklet-szabályozással

3240 F típusú önreaktív szilárd anyag hőmérséklet-szabályozással.

## 2.2.41.3 A gyújtómegnevezések felsorolása

Járulékos veszély	Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
Gyúlékony szilárd anyagok	járálekos veszély nélkül	szerves anyagok F1	3175 GYÚLÉKONY FOLYADÉK TARTALMÚ SZILÁRD ANYAGOK, M.N.N. 1353 GYENGÉN NITRÁLT NITROCELLULÓZZAL IMPREGNÁLT SZÁLAK, M.N.N. vagy 1353 GYENGÉN NITRÁLT NITROCELLULÓZZAL IMPREGNÁLT SZÖVETEK, M.N.N. 1325 GYÚLÉKONY, SZERVES SZILÁRD ANYAG, M.N.N.
		szerves anyagok F2	3176 SZERVES, GYÚLÉKONY SZILÁRD ANYAG OLVASZTOTT ÁLLAPOTBAN, M.N.N.
		olvasztott állapotban	
		szervetlen anyagok F3	3089 GYÚLÉKONY FÉMPOR, M.N.N. <sup>a, b)</sup> 3181 SZERVES VEGYÜLETEK GYÚLÉKONY FÉMSÓI, M.N.N. 3182 GYÚLÉKONY FÉMHIDRIDEK, M.N.N. <sup>c)</sup> 3178 SZERVETLEN, GYÚLÉKONY SZILÁRD ANYAG, M.N.N.
	gyújtó hatású anyagok	FO	3097 GYÚJTÓ HATÁSÚ, GYÚLÉKONY SZILÁRD ANYAG, M.N.N. (a fuvarozásból ki van zárva, lásd a 2.2.41.2.2 pontot)

(a fuvarozásból ki van zárva, lásd a 2.2.41.2.3 pontot)

(nem tartozik a 4.1 osztály előírásainak hatálya alá, lásd a 2.2.41.1.11 pontot)

**Megjegyzés:**

- A fémek és fémötvözetek por vagy egyéb gyúlékony formában, ha öngyulladásra hajlamosak, a 4.2 osztály anyagai.
- A fémek és fémötvözetek por vagy egyéb gyúlékony formában, ha vízzel érintkezve gyúlékony gázokat fejlesztenek, a 4.3 osztály anyagai.
- Azok a fém-hidridek, amelyek vízzel érintkezve gyúlékony gázokat fejlesztenek, a 4.3 osztály anyagai. Az alumínium-bórhidrid vagy alumínium-bórhidrid készülékekben a 4.2 osztály UN 2870 alá tartozó anyag.

#### 2.2.41.4 *A már besorolt és csomagolóeszközben való szállításra engedélyezett önreaktív anyagok felsorolása*

A „csomagolási módszer” oszlopban az „OP1” – „OP8” kód a 4.1.4.1 bekezdés P520 csomagolási utasítás csomagolási módszereire utal (lásd még a 4.1.7.1 bekezdést). A szállítandó önreaktív anyagnak meg kell felelnie a felsorolás szerinti besorolásnak. Az IBC-ben engedélyezett anyagokra lásd a 4.1.4.2 bekezdés IBC520 csomagolási utasítását, a 4.2 fejezet szerint tartányban engedélyezettekre lásd a 4.2.5.2 bekezdés T23 mobil tartány utasítását.

**Megjegyzés:** Az ebben a táblázatban levő besorolás a technikailag tiszta anyagokon alapul (kivéve, ha a megadott koncentráció 100%-nál kisebb). Más koncentrációk esetében az anyag a „Vizsgálatok és kritériumok kézikönyv” II. Részében található eljárást követve ettől eltérően is besorolható.

ÖNREAKTÍV ANYAG	Koncentráció (%)	Csomagolási módszer	Generikus UN tétel	Megjegyzés

**Megjegyzés:**

- 1) (fenntartva)
- 2) „ROBBANÁSVESZÉLY” járulékos veszély bárca szükséges (1 sz. bárca, lásd az 5.2.2.2.2 pontot)
- 3) A „Vizsgálatok és kritériumok kézikönyv” II. rész 20.4.2.c) bekezdését kielégítő azo-dikarbonamid készítmények.
- 4) (fenntartva)
- 5) A „Vizsgálatok és kritériumok kézikönyv” II. rész 20.4.2.d) bekezdését kielégítő azo-dikarbonamid készítmények.
- 6) (fenntartva)
- 7) Legalább 150 °C forráspontú, összeférhető hígítóval.
- 8) Lásd a 2.2.41.1.15 pontot.
- 9) Ez a tétel a 2-diazo-1-naftol-4-szulfonsav észter és a 2-diazo-1-naftol-5-szulfonsav észter keverékeire vonatkozik, amelyek megfelelnek a „Vizsgálatok és kritériumok kézikönyv” 20.4.2 d) bekezdésének kritériumainak.

**2.2.42            4.2 osztály            Öngyulladásra hajlamos anyagok****2.2.42.1            *Kritériumok*****2.2.42.1.1**    A 4.2 osztály fogalomköre a következőkre terjed ki:

- piroforos anyagokra, amelyek olyan anyagok (beleértve a folyékony vagy szilárd keverékeket és oldatokat), amelyek már kis mennyiségben is a levegővel érintkezve 5 percen belül meggyulladnak. A 4.2 osztály ezen anyagai a leginkább öngyulladásra hajlamosak; és
- önmelegedő anyagokra és tárgyakra, amelyek olyan anyagok és tárgyak (beleértve az oldatokat és keverékeket), amelyek a levegővel érintkezve energia közlés nélkül hajlamosak az önmelegedésre. Ezek az anyagok csak nagy mennyiségben (több kilogrammban), hosszabb idő után (órák vagy napok) gyulladnak meg.

**2.2.42.1.2**    A 4.2 osztály anyagai és tárgyai a következők szerint vannak csoportosítva:

S    Öngyulladásra hajlamos anyagok járulékos veszély nélkül:

- S1    Szerves, folyékony anyagok
- S2    Szerves, szilárd anyagok
- S3    Szervetlen, folyékony anyagok
- S4    Szervetlen, szilárd anyagok
- S5    Szerves fémvegyületek

SW   Öngyulladásra hajlamos anyagok, amelyek vízzel érintkezve gyúlékony gázokat fejlesztenek

SO   Öngyulladásra hajlamos, gyújtó hatású anyagok

ST   Öngyulladásra hajlamos, mérgező anyagok:

- ST1   Mérgező, szerves, folyékony anyagok
- ST2   Mérgező, szerves, szilárd anyagok
- ST3   Mérgező, szervetlen, folyékony anyagok
- ST4   Mérgező, szervetlen, szilárd anyagok

SC   Öngyulladásra hajlamos, maró anyagok:

- SC1   Maró, szerves, folyékony anyagok
- SC2   Maró, szerves, szilárd anyagok
- SC3   Maró, szervetlen, folyékony anyagok
- SC4   Maró, szervetlen, szilárd anyagok.

*Tulajdonságok***2.2.42.1.3**    Ezen anyagok önmelegedését, ami öngyuladáshoz vezet, az anyagok oxigénnel (levegőn) történő reakciója okozza, mivel a fejlődő hő nem képes elég gyorsan a környezetbe távozni. Öngyulladás akkor következik be, ha a hőfejlődés sebessége meghaladja a hővesztesség sebességét és az anyag eléri az öngyulladási hőmérsékletet.*Besorolás***2.2.42.1.4**    A 4.2 osztályba sorolt anyagokat és tárgyakat a 3.2 fejezet „A” táblázata sorolja fel. A 3.2 fejezet „A” táblázatában név szerint nem említett anyagok és tárgyak besorolása a 2.1 fejezet

előírásai szerint a 2.2.42.3 bekezdés megfelelő m.n.n. tétele alá, a tapasztalatok alapján vagy a „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.3 bekezdése szerinti vizsgálati eljárások eredményei alapján történhet. A 4.2 osztály valamely általános m.n.n. tétele alá történő besorolásnak a „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.3 bekezdése szerinti vizsgálati eljárások eredményei alapján kell történnie; a tapasztalatokat is figyelembe kell azonban venni, ha azok szigorúbb hozzárendeléshez vezetnének.

#### 2.2.42.1.5

A név szerint nem említett anyagoknak vagy tárgyakkal a „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.3 bekezdése szerinti vizsgálati eljárások eredményei alapján a 2.2.42.3 bekezdés valamely tétele alá történő besorolásánál a következő kritériumokat kell alkalmazni:

- a) az öngyulladásra hajlamos (piroforos) szilárd anyagokat akkor kell a 4.2 osztályba sorolni, ha 1 m magasságból leejtve vagy öt percen belül meggyulladnak;
- b) az öngyulladásra hajlamos (piroforos) folyékony anyagokat akkor kell a 4.2 osztályba sorolni, ha:
  - i) inert hordozóra kiöntve öt percen belül meggyulladnak, vagy
  - ii) az i) szerinti próbánál negatív eredményt adnak, de száraz, redőzött szűrőpapírra kiöntve (Whatman No. 3 szűrőpapír) öt percen belül meggyulladnak vagy a szűrőpapírt elszeszesítik;
- c) azokat az anyagokat, amelyeknél egy 10 cm élhosszúságú kocka alakú mintában 140 °C vizsgálati hőmérsékleten 24 órán belül öngyulladás vagy a hőmérséklet 200 °C fölé emelkedése figyelhető meg, a 4.2 osztályba kell sorolni. Ez a kritérium a faszén öngyulladási hőmérsékletén alapul, ami 27 m<sup>3</sup>-es kockánál 50 °C. Azokat az anyagokat, amelyek öngyulladási hőmérséklete 27 m<sup>3</sup> térfogatú kocka formában 50 °C-nál magasabb, nem szabad a 4.2 osztályba sorolni.

**Megjegyzés:** 1. Azok az anyagok, amelyeket legfeljebb 3 m<sup>3</sup> térfogatú csomagolásokban szállítanak, nem tartoznak a 4.2 osztályba, ha 10 cm élhosszúságú kocka alakú mintában 120 °C vizsgálati hőmérsékleten 24 órán belül öngyulladás vagy a hőmérséklet 180 °C fölé emelkedése nem figyelhető meg.

2. Azok az anyagok, amelyeket legfeljebb 450 liter térfogatú csomagolásokban szállítanak, nem tartoznak a 4.2 osztályba, ha 10 cm élhosszúságú kocka alakú mintában 100 °C vizsgálati hőmérsékleten 24 órán belül öngyulladás vagy a hőmérséklet 160 °C fölé emelkedése nem figyelhető meg.

3. Mivel a járulékos veszélyekkel rendelkező szerves fémvegyületek tulajdonságaiktól függően a 4.2 vagy a 4.3 osztályba sorolhatók, ezekhez az anyagokhoz a 2.3.5 szakaszban különleges besorolási folyamatára található.

#### 2.2.42.1.6

Ha a 4.2 osztály anyagai valamilyen adalékanyag hozzáadása révén eltérő veszélyességi kategóriába kerülnek át, mint ahová a 3.2 fejezet „A” táblázatában név szerint említett anyagok tartoznak, ezeket a keverékeket vagy oldatokat azok alá a tételek alá kell besorolni, ahová tényleges veszélyességük mértéke alapján tartoznak.

**Megjegyzés:** Az oldatok és keverékek (készítmények és hulladékok) besorolásához lásd a 2.1.3 szakaszt.

#### 2.2.42.1.7

A „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.3 bekezdése szerinti vizsgálati eljárások és a 2.2.42.1.5 pontban található kritériumok alapján az is meghatározható, hogy egy név szerint feltüntetett anyag természete olyan, hogy az anyag nem esik ezen osztály előírásainak hatálya alá.

*Csomagolási csoporthoz való hozzárendelés*

**2.2.42.1.8** A 3.2 fejezet „A” táblázatának egyes tételei alá sorolt anyagokat és tárgyakat a „Vizsgálatok és kritériumok kézikönyv” III. rész 33.3 bekezdése szerinti vizsgálati eljárások alapján az I, a II vagy a III csomagolási csoportba kell sorolni a következő kritériumok szerint:

- a) az öngyulladásra hajlamos (piroforos) anyagokat az I csomagolási csoportba kell sorolni;
- b) azokat az önmelegedő anyagokat és tárgyakat, amelyeknél 2,5 cm élhosszúságú kocka alakú mintában 140 °C vizsgálati hőmérsékleten 24 órán belül öngyulladás vagy a hőmérséklet 200 °C fölé emelkedése figyelhető meg, a II csomagolási csoportba kell sorolni.

Azokat az anyagokat, amelyek öngyulladási hőmérséklete 450 liter térfogatban meghaladja az 50 °C-ot, nem kell a II csomagolási csoportba sorolni;

- c) azokat a gyengén önmelegedő anyagokat, amelyeknél 2,5 cm élhosszúságú kocka alakú mintában a b) pontban említett jelenségek nem figyelhetők meg az adott körülmények között, de amelyeknél 10 cm élhosszúságú kocka alakú mintában 140 °C vizsgálati hőmérsékleten 24 órán belül öngyulladás vagy a hőmérséklet 200 °C fölé emelkedése figyelhető meg, a III csomagolási csoportba kell sorolni.

**2.2.42.2** *A fuvarozásból kizárt anyagok*

A következő anyagok a fuvarozásból ki vannak zárva:

- az UN 3255 terc-butil-hipoklorit; és
- az UN 3127 számú gyújtó hatású, önmelegedő, szilárd anyagok, kivéve, ha megfelelnek az 1 osztály előírásainak (lásd a 2.1.3.7 bekezdést).

## 2.2.42.3 A gyújtómegnevezések felsorolása

a) Azok a nem mérgező fémporok és finom porok, amelyek öngyulladásra nem hajlamos formában vannak, de amelyek vízzel érintkezve gyúlékony gázokat fejlesztenek, a 4.3 osztály anyagai.

**2.2.43 4.3 osztály Vízrel érintkezve gyúlékony gázokat fejlesztő anyagok****2.2.43.1 Kritériumok**

**2.2.43.1.1** A 4.3 osztály fogalmköre olyan anyagokra és olyan anyagokat tartalmazó tárgyra terjed ki, amelyek vízzel reagálva a levegővel robbanó keverék alkotására hajlamos, gyúlékony gázokat fejlesztenek.

**2.2.43.1.2** A 4.3 osztály anyagai és tárgyai a következők szerint vannak csoportosítva:

W Vízrel érintkezve gyúlékony gázokat fejlesztő anyagok járulékos veszély nélkül és az ilyen anyagokat tartalmazó tárgyak:

W1 Folyékony anyagok

W2 Szilárd anyagok

W3 Tárgyak

WF1 Vízrel érintkezve gyúlékony gázokat fejlesztő, folyékony, gyúlékony anyagok

WF2 Vízrel érintkezve gyúlékony gázokat fejlesztő, szilárd, gyúlékony anyagok

WS Vízrel érintkezve gyúlékony gázokat fejlesztő, önmelegedő, szilárd anyagok

WO Vízrel érintkezve gyúlékony gázokat fejlesztő, gyújtó hatású, szilárd anyagok

WT Vízrel érintkezve gyúlékony gázokat fejlesztő, mérgező anyagok:

WT1 Folyékony anyagok

WT2 Szilárd anyagok

WC Vízrel érintkezve gyúlékony gázokat fejlesztő, maró anyagok:

WC1 Folyékony anyagok

WC2 Szilárd anyagok

WFC Vízrel érintkezve gyúlékony gázokat fejlesztő, gyúlékony, maró anyagok.

*Tulajdonságok*

**2.2.43.1.3** Bizonyos anyagok a vízzel érintkezve olyan gyúlékony gázokat fejleszthetnek, amelyek a levegővel robbanó elegyet alkothatnak. Az ilyen keverékek bármilyen közönséges gyújtóforrástól, pl. nyílt lángtól, szikrát vető kéziszerszámtól vagy védelem nélküli izzólámpától könnyen meggyulladhatnak. A keletkező lökéshullám és a láng veszélyeztetheti az embereket és a környezetet. A 2.2.43.1.4 pontban leírt vizsgálati módszer használatos annak meghatározására, hogy az anyag reakciója a vízzel nem jár-e veszélyes mennyiségű, esetleg gyúlékony gázok fejlődésével. Ezt a módszert piroforos anyagokhoz nem szabad használni.

*Besorolás*

**2.2.43.1.4** A 4.3 osztályba sorolt anyagokat és tárgyakat a 3.2 fejezet „A” táblázata sorolja fel. A 3.2 fejezet „A” táblázatában név szerint nem említett anyagok és tárgyak besorolásának a 2.1 fejezet előírásai szerint a 2.2.43.3 bekezdés megfelelő tétele alá a „Vizsgálatok és kritériumok kézikönyv” III. rész 33.4 bekezdése szerinti vizsgálati eljárások eredményei alapján kell történnie; a tapasztalatokat is figyelembe kell azonban venni, ha azok szigorúbb besoroláshoz vezetnének.

- 2.2.43.1.5** A név szerint nem említett anyagoknak a „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.4 bekezdése szerinti vizsgálati eljárások eredményei alapján a 2.2.43.3 bekezdés valamely tétele alá történő besorolásánál a következő kritériumokat kell alkalmazni:

Egy anyagot akkor kell a 4.3 osztályba sorolni, ha

- a) a vizsgálatok bármely szakaszában a fejlődött gáz magától meggyullad; vagy
- b) a gyúlékony gáz fejlődési sebessége a vizsgált anyag 1 kg-jára számítva meghaladja az 1 liter/óra értéket.

***Megjegyzés:** Mivel a járulékos veszélyekkel rendelkező szerves fémvegyületek tulajdonságaiktól függően a 4.2 vagy a 4.3 osztályba sorolhatók, ezekhez az anyagokhoz a 2.3.5 szakaszban különleges besorolási folyamatára található.*

- 2.2.43.1.6** Ha a 4.3 osztály anyagai valamilyen adalékanyag hozzáadása révén eltérő veszélyességi kategóriába kerülnek át, mint ahová a 3.2 fejezet „A” táblázatában név szerint említett anyagok tartoznak, ezeket a keverékeket vagy oldatokat azok alá a tételek alá kell besorolni, ahová tényleges veszélyességük mértéke alapján tartoznak.

***Megjegyzés:** Az oldatok és keverékek (készítmények és hulladékok) besorolásához lásd a 2.1.3 szakaszt.*

- 2.2.43.1.7** A „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.4 bekezdése szerinti vizsgálati eljárások és a 2.2.43.1.5 pontban található kritériumok alapján az is meghatározható, hogy egy név szerint feltüntetett anyag természete olyan, az anyag nem esik ezen osztály előírásainak hatálya alá.

*Csomagolási csoporthoz való hozzárendelés*

- 2.2.43.1.8** A 3.2 fejezet „A” táblázatának egyes tételei alá sorolt anyagokat és tárgyakat a „Vizsgálatok és kritériumok kézikönyv” III. Rész 33.4 bekezdése szerinti vizsgálati eljárások alapján az I, a II vagy a III csomagolási csoportba kell sorolni a következő kritériumok szerint:

- a) Az I csomagolási csoportba akkor kell sorolni egy anyagot, ha szobahőmérsékleten a vízzel erőlesen reagál és a fejlődő gáz általában hajlamot mutat arra, hogy önmagától meggyulladjon, vagy szobahőmérsékleten olyan könnyen reagál a vízzel, hogy a gyúlékony gáz fejlődésének mértéke a vizsgált anyag 1 kg-jára számítva bármely egy perces időtartam alatt legalább 10 liter;
- b) A II csomagolási csoportba akkor kell sorolni egy anyagot, ha szobahőmérsékleten olyan könnyen reagál vízzel, hogy a gyúlékony gáz maximális fejlődési sebessége a vizsgált anyag 1 kg-jára számítva legalább 20 liter/óra és az I csomagolási csoport kritériumai nem teljesülnek;
- c) A III csomagolási csoportba akkor kell sorolni egy anyagot, ha szobahőmérsékleten olyan lassan reagál vízzel, hogy a gyúlékony gáz maximális fejlődési sebessége a vizsgált anyag 1 kg-jára számítva legalább 1 liter/óra és sem az I csomagolási csoport, sem a II csomagolási csoport kritériumai nem teljesülnek.

**2.2.43.2** *A fuvarozásból kizárt anyagok*

Az UN 3133 alá sorolt vízzel reaktív, gyújtó hatású, szilárd anyagok a szállításból ki vannak zárva, kivéve ha megfelelnek az 1 osztály előírásainak (lásd a 2.1.3.7 bekezdést is).

**2.2.43.3 A gyújtómegnevezések felsorolása**

**Megjegyzés:**

a) Azok a fémek és fémötvözetek, amelyek a vízzel érintkezve nem fejlesztenek gyúlékony

*gázokat és nem piroforosak, vagy nem önmelegedők, de amelyek könnyen meggyulladnak, a 4.1 osztály anyagai. Az alkáliföldfémek és alkáliföldfém ötvözetek piroforos formában a 4.2 osztály anyagai. A fémporok és finom porok piroforos állapotban a 4.2 osztály anyagai. A fémek és fémötvözetek piroforos állapotban a 4.2 osztály anyagai. A foszfor vegyületei nehézfémekkel, pl. vassal, rézzel stb. nem esnek a RID előírásainak hatálya alá.*

- b) A fémek és fémötvözetek piroforos állapotban a 4.2 osztály anyagai.*
- c) Azok a klór-szilánok, amelyek lobbanáspontja 23 °C alatti, és vízzel érintkezve nem fejlesztenek gyúlékony gázokat, a 3 osztály anyagai. Azok a klór-szilánok, amelyek lobbanáspontja 23 °C vagy ennél magasabb, és vízzel érintkezve nem fejlesztenek gyúlékony gázokat, a 8 osztály anyagai.*

**2.2.51 5.1 osztály Gyújtó hatású (oxidáló) anyagok****2.2.51.1 Kritériumok**

**2.2.51.1.1** Az 5.1 osztály fogalmköre olyan anyagokra és olyan anyagokat tartalmazó tárgyakra terjed ki, amelyek bár önmagukban nem szükségszerűen gyúlékonyak, általában oxigén leadásával tüzet okozhatnak vagy más anyagok égését elősegíthetik.

**2.2.51.1.2** Az 5.1 osztály anyagai és az ilyen anyagokat tartalmazó tárgyak a következők szerint vannak csoportosítva:

O Gyújtó hatású anyagok járulékos veszély nélkül vagy ilyen anyagokat tartalmazó tárgyak:

O1 Folyékony anyagok

O2 Szilárd anyagok

O3 Tárgyak

OF Gyújtó hatású szilárd, gyúlékony anyagok

OS Gyújtó hatású szilárd, önmelegedő anyagok

OW Gyújtó hatású szilárd anyagok, amelyek vízzel érintkezve gyúlékony gázokat fejlesztenek

OT Gyújtó hatású, mérgező anyagok:

OT1 Folyékony anyagok

OT2 Szilárd anyagok

OC Gyújtó hatású, maró anyagok:

OC1 Folyékony anyagok

OC2 Szilárd anyagok

OTC Gyújtó hatású, mérgező, maró anyagok.

**2.2.51.1.3** Az 5.1 osztályba sorolt anyagokat és tárgyakat a 3.2 fejezet „A” táblázata sorolja fel. A 3.2 fejezet „A” táblázatában név szerint nem említett anyagok és tárgyak besorolása a 2.1 fejezet szerint a 2.2.51.3 bekezdés megfelelő tétele alá a következő 2.2.51.1.6 – 2.2.51.1.9 pontok és a „Vizsgálatok és kritériumok kézikönyv” III. Rész 34.4 bekezdése szerinti kritériumok, módszerek és vizsgálati eljárások alapján történhet. Amennyiben a vizsgálati eredmények és az ismeretes tapasztalatok között eltérés van, a tapasztalat alapján való megítélést előnyben kell részesíteni a vizsgálati eredményekkel szemben.

**2.2.51.1.4** Ha az 5.1 osztály anyagai valamilyen anyag hozzáadása révén eltérő veszélyességi kategóriába kerülnek át, mint ahová a 3.2 fejezet „A” táblázatában név szerint említett anyagok tartoznak, ezeket a keverékeket azok alá a tételek alá kell besorolni, amelyekbe tényleges veszélyességük mértéke alapján tartoznak.

**Megjegyzés:** Az oldatok és keverékek (készítmények és hulladékok) besorolásához lásd a 2.1.3 szakaszt.

**2.2.51.1.5** A „Vizsgálatok és kritériumok kézikönyv” III. Rész 34.4 bekezdése szerinti vizsgálati eljárások és a 2.2.51.1.6 – 2.2.51.1.9 pontban található kritériumok alapján az is meghatározható, hogy egy név szerint feltüntetett anyag természete olyan, hogy az anyag nem esik ezen osztály előírásainak hatálya alá.

***Gyújtó hatású szilárd anyagok******Besorolás***

- 2.2.51.1.6** A 3.2 fejezet „A” táblázatában név szerint nem említett gyújtó hatású, szilárd anyagoknak a „Vizsgálatok és kritériumok kézikönyv” III. Rész 34.4.1 bekezdése szerinti vizsgálati eljárások alapján a 2.2.51.3 bekezdés valamely tétele alá történő besorolásánál a következő kritériumokat kell alkalmazni:

Egy szilárd anyagot akkor kell az 5.1 osztályba sorolni, ha cellulózzal 4:1 vagy 1:1 tömegarányban alkotott keveréke meggyullad vagy elég vagy az átlagos égési ideje azonos vagy rövidebb, mint a kálium-bromát/cellulóz 3:7 tömegarányú keverék átlagos égési ideje.

***Csomagolási csoporthoz való hozzárendelés***

- 2.2.51.1.7** A 3.2 fejezet „A” táblázatának egyes tételei alá sorolt gyújtó hatású, szilárd anyagokat a „Vizsgálatok és kritériumok kézikönyv” III. rész 34.4.1 bekezdése szerinti vizsgálati eljárások alapján az I, a II vagy a III csomagolási csoportba kell sorolni, a következő kritériumok szerint:

- a) az I csomagolási csoportba akkor kell sorolni az anyagot, ha cellulózzal 4:1 vagy 1:1 tömegarányban alkotott keverékének átlagos égési ideje rövidebb, mint a kálium-bromát/cellulóz 3:2 tömegarányú keverék átlagos égési ideje;
- b) a II csomagolási csoportba akkor kell sorolni az anyagot, ha cellulózzal 4:1 vagy 1:1 tömegarányban alkotott keverékének átlagos égési ideje azonos vagy rövidebb, mint a kálium-bromát/cellulóz 2:3 tömegarányú keverék átlagos égési ideje és az I csomagolási csoport kritériumait nem elégtí ki;
- c) a III csomagolási csoportba akkor kell sorolni az anyagot, ha cellulózzal 4:1 vagy 1:1 tömegarányban alkotott keverékének átlagos égési ideje azonos vagy rövidebb, mint a kálium-bromát/cellulóz 3:7 tömegarányú keverék átlagos égési ideje és sem az I, sem a II csomagolási csoport kritériumait nem elégtí ki.

***Gyújtó hatású folyékony anyagok******Besorolás***

- 2.2.51.1.8** A 3.2 fejezet „A” táblázatában név szerint nem említett gyújtó hatású, folyékony anyagoknak a „Vizsgálatok és kritériumok kézikönyv” III. rész 34.4.2 bekezdése szerinti vizsgálati eljárások alapján a 2.2.51.3 bekezdés valamely tétele alá történő besorolásánál a következő kritériumokat kell alkalmazni:

Egy folyékony anyagot akkor kell az 5.1 osztályba sorolni, ha cellulózzal 1:1 tömegarányban alkotott keveréke 2070 kPa vagy nagyobb nyomásnövekedést eredményez, és az átlagos nyomásnövekedési idő azonos vagy rövidebb, mint a 65%-os vizes salétromsav oldat/cellulóz 1:1 tömegarányú keveréke esetében.

***Csomagolási csoporthoz való hozzárendelés***

- 2.2.51.1.9** A 3.2 fejezet „A” táblázatának egyes tételei alá sorolt gyújtó hatású, folyékony anyagokat a „Vizsgálatok és kritériumok kézikönyv” III. rész 34.4.2 bekezdése szerinti vizsgálati eljárások alapján az I, a II vagy a III csomagolási csoportba kell sorolni, a következő kritériumok szerint:

- a) az I csomagolási csoportba akkor kell sorolni az anyagot, ha cellulózzal 1:1

tömegarányban alkotott keveréke önmagától meggyullad, vagy a nyomásnövekedési ideje rövidebb, mint az 50%-os perklórsav oldat/cellulóz 1:1 tömegarányú keveréké;

- b) a II csomagolási csoportba akkor kell sorolni az anyagot, ha cellulózzal 1:1 tömegarányban alkotott keverékének nyomásnövekedési ideje azonos vagy rövidebb, mint a 40%-os vizes nátrium-klorát oldat/cellulóz 1:1 tömegarányú keveréké és az I csomagolási csoport kritériumait nem elégíti ki;
- c) a III csomagolási csoportba akkor kell sorolni az anyagot, ha cellulózzal 1:1 tömegarányban alkotott keverékének nyomásnövekedési ideje azonos vagy rövidebb, mint a 65%-os vizes salétromsav oldat/cellulóz 1:1 tömegarányú keveréké és sem az I, sem a II csomagolási csoport kritériumait nem elégíti ki.

#### **2.2.51.2** *A fuvarozásból kizárt anyagok*

**2.2.51.2.1** Az 5.1 osztály vegyileg nem állandó anyagai csak akkor adhatók át fuvarozásra, ha megtették a szükséges intézkedéseket a szállítás alatt bekövetkező veszélyes bomlás vagy polimerizáció megakadályozására. Ezért különösen arról kell gondoskodni, hogy a tartályok és tartályok ne tartalmazzanak olyan anyagokat, amelyek az ilyen reakciókat elősegítik.

**2.2.51.2.2** A következő anyagok a fuvarozásból ki vannak zárva:

- az UN 3100 számú önmelegedő, gyújtó hatású szilárd anyagok, az UN 3121 számú vízzel reaktív, gyújtó hatású szilárd anyagok és az UN 3137 számú gyúlékony, gyújtó hatású szilárd anyagok, kivéve, ha megfelelnek az 1 osztály előírásainak (lásd a 2.1.3.7 bekezdést is);
- a nem stabilizált hidrogén-peroxid és a nem stabilizált hidrogén-peroxid vizes oldatok 60%-nál több hidrogén-peroxid tartalommal;
- az éghető szennyeződésektől nem mentes tetranitro-metán;
- perklórsav oldatok 72 tömeg%-nál nagyobb savtartalommal és a perklórsav keverékek vízen kívül bármilyen más folyadékkal;
- a klórsav oldatok 10% feletti klórsav-tartalommal és a klórsav keverékek vízen kívül bármilyen más folyadékkal;
- az ebbe az osztályba tartozó UN 1745 bróm-pentafluorid, 1746 bróm-trifluorid és 2495 jód-pentafluorid, valamint a 2 osztályba tartozó UN 1749 klór-trifluorid és 2548 klór-pentafluorid kivételével minden más halogénezett fluorvegyület;
- az ammónium-klorát és vizes oldatait, valamint a klorátok keverékei ammóniumsóval;
- az ammónium-klorit és vizes oldatait, valamint a kloritok keverékei ammóniumsóval;
- a hipokloritok keverékei ammóniumsóval;
- az ammónium-bromát és vizes oldatait, valamint a bromátok keverékei ammóniumsóval;
- az ammónium-permanganát és vizes oldatait, valamint a permanganátok keverékei ammóniumsóval;
- az ammónium-nitrát 0,2%-nál több éghető anyag tartalommal (beleértve bármilyen szerves anyagot szénegyenértékre átszámítva), hacsak nem valamely 1 osztályba tartozó anyag vagy tárgy alkotórésze;
- az ammónium-nitrát tartalmú műtrágyák, amelyek ammónium-nitrát tartalma (mindazon nitrát-ion mennyiséget, amellyel egyenértékű tömegű ammónium-ion van jelen a keverékben, ammónium-nitrátként kell számításba venni) vagy éghető anyag tartalma a 307 különleges előírásban megadott határokat meghaladja, kivéve az 1 osztályra

vonatkozó feltételek melletti fuvarozást;

- az ammónium-nitrit és vizes oldata, valamint a szervetlen nitrtek keverékei ammóniumsóval;
- a kálium-nitrát és nátrium-nitrit keverékei ammóniumsóval.

### 2.2.51.3 A gyűjtőmegnevezések felsorolása

Járlékos veszély	Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
Gyújtó hatású (oxidáló) anyagok			
	folyékony anyagok	O1	3210 SZERVETLEN KLOORÁTOK VIZES OLDATA, M.N.N. 3211 SZERVETLEN PERKLOORÁTOK VIZES OLDATA, M.N.N. 3213 SZERVETLEN BROMÁTOK VIZES OLDATA, M.N.N. 3214 SZERVETLEN PERMANGANÁTOK VIZES OLDATA, M.N.N. 3216 SZERVETLEN PERSZULFÁTOK VIZES OLDATA, M.N.N. 3218 SZERVETLEN NITRÁTOK VIZES OLDATA, M.N.N. 3219 SZERVETLEN NITRITEK VIZES OLDATA, M.N.N. 3139 FOLYÉKONY, GYÚJTÓ HATÁSÚ ANYAG, M.N.N.

Mérgező, maró anyagok		OTC	(Ilyen osztályozási kóddal nincs gyűjtőmegnevezés. Ha szükséges, a 2.1.3.10 bekezdés veszélyességi rangsor táblázata alapján meghatározandó, másik osztályozási kód valamely gyűjtőmegnevezése alá kell sorolni.)

**2.2.52 5.2 osztály Szerves peroxidok****2.2.52.1 Kritériumok**

**2.2.52.1.1** Az 5.2 osztály fogalomköre a szerves peroxidokra és a szerves peroxid készítményekre terjed ki.

**2.2.52.1.2** Az 5.2 osztály anyagai a következők szerint vannak csoportosítva:

P1 Szerves peroxidok hőmérséklet-szabályozás nélkül

P2 Szerves peroxidok hőmérséklet-szabályozással (a vasúti fuvarozásból ki vannak zárva).

*Fogalommeghatározás*

**2.2.52.1.3** A szerves peroxidok olyan szerves anyagok, amelyek a kétértékű –O–O– szerkezeti elemet tartalmazzák és amelyek a hidrogén-peroxid olyan származékainak tekinthetők, ahol egyik vagy mindkét hidrogén atomot szerves gyökök helyettesítenek.

*Tulajdonságok*

**2.2.52.1.4** A szerves peroxidok normál vagy magasabb hőmérsékleten hajlamosak az exoterm bomlásra. A bomlás hőhatásra, szennyező anyagokkal (pl. savak, nehézfém vegyületek, aminok) való érintkezésre, sűrűlódás vagy ütés hatására következhet be. A bomlási sebesség a hőmérséklettel növekszik és függ a szerves peroxid kikészítésétől. A bomlás során egészségre ártalmas vagy gyúlékony gázok vagy gőzök fejlődhetnek. Egyes szerves peroxidok robbanásszerű bomlást szenvedhetnek, különösen zárt térben. Ez a tulajdonság hígítók hozzáadásával vagy megfelelő csomagolás használatával megváltoztatható. Számos szerves peroxid erőlyesen ég. El kell kerülni, hogy a szerves peroxid a szemmel érintkezésbe kerülhessen. Egyes szerves peroxidok már rövid érintkezés hatására a szaruhártya súlyos sérülését vagy a bőr felmaródását okozhatják.

**Megjegyzés:** A szerves peroxidok gyúlékonyságának meghatározására szolgáló vizsgálati módszereket a „Vizsgálatok és kritériumok kézikönyv” III. Rész 32.4 bekezdése tartalmazza. Mivel a szerves peroxidok hő hatására hevesen reagálhatnak, ajánlatos a lobbanáspont meghatározásához kis méretű mintát használni, pl. amilyen az ISO 3679:1983 szabványban szerepel.

*Besorolás*

**2.2.52.1.5** Bármely szerves peroxidot az 5.2 osztályba sorolhatónak kell tekinteni, kivéve, ha:

- legfeljebb 1,0%, szerves peroxidból származó aktív oxigént és legfeljebb 1,0% hidrogén-peroxidot tartalmaz;
- legfeljebb 0,5%, szerves peroxidból származó aktív oxigént és 1,0%-nál több, de legfeljebb 7,0% hidrogén-peroxidot tartalmaznak.

**Megjegyzés:** Valamely szerves peroxidot tartalmazó készítmény aktív oxigéntartalma (%-ban) a  $16 \times \sum (n_i \times c_i / m_i)$  képlettel határozható meg, ahol  $n_i$  = az  $i$ -edik szerves peroxid molekulánkénti peroxid-csoportjainak száma;  $c_i$  = az  $i$ -edik szerves peroxid koncentrációja (tömeg%); és  $m_i$  = az  $i$ -edik szerves peroxid molekulatömege.

**2.2.52.1.6** A szerves peroxidok veszélyességük mértéke szerint hét típusba vannak sorolva. A típusok

az A típustól, amely abban a csomagolásban, amelyben bevizsgálásra került, nem szállítható, egészen a G típusig tartanak, amely nem esik az 5.2 osztály előírásainak hatálya alá. A B-től F-ig terjedő típusok alá való besorolás az egy csomagolásban engedélyezett legnagyobb mennyiségtől függ. A 2.2.52.4 bekezdésben fel nem sorolt anyagok besorolásának alapelveit a „Vizsgálatok és kritériumok kézikönyv” II. Rész tartalmazza.

- 2.2.52.1.7** A már besorolt és csomagolóeszközben való szállításra már engedélyezett szerves peroxidokat a 2.2.52.4 bekezdés, az IBC-ben való szállításra már engedélyezett szerves peroxidokat a 4.1.4.2 bekezdés IBC520 csomagolási utasítása, és a 4.2, ill. a 4.3 fejezet szerint tartályban szállítható szerves peroxidokat a 4.2.5.2 bekezdés T23 mobil tartály utasítása sorolja fel. Ezekben a felsorolásokban minden engedélyezett anyag a 3.2 fejezet „A” táblázatának valamely generikus tételéhez (UN 3101 – 3120) hozzá van rendelve, és meg vannak adva a szállítás szempontjából fontos információt jelentő járulékos veszélyek, ill. megjegyzések.

A generikus tételek meghatározzák:

- a szerves peroxid típusait (B – F) (lásd a 2.2.52.1.6 pontot);
- a fizikai állapotot (folyékony/szilárd).

A szerves peroxid készítmények keverékei a legveszélyesebb alkotórésznek megfelelő típusú szerves peroxidként sorolhatók be és az arra a típusra megadott szállítási feltételek mellett kell szállítani. Azonban, ha két termikusan stabil alkotórész termikusan kevésbé stabil keveréket képezhet, a keverék öngyorsuló bomlási hőmérsékletét (ÖBH) meg kell határozni.

- 2.2.52.1.8** A 2.2.52.4 bekezdésben, a 4.1.4.2 bekezdés IBC520 csomagolási utasításában, ill. a 4.2.5.2 bekezdés T23 mobil tartály utasításában fel nem sorolt szerves peroxidok, szerves peroxid készítmények vagy keverékek besorolását és valamely gyűjtőmegnevezéshez történő hozzárendelését a származási ország illetékes hatóságának kell végeznie. A jóváhagyásnak tartalmaznia kell a besorolást és a vonatkozó szállítási feltételeket. Amennyiben a származási ország nem valamely COTIF Tagállam, úgy a besorolást és a szállítási feltételeket a küldemény által érintett első COTIF Tagállam illetékes hatóságának kell elismernie.

- 2.2.52.1.9** A 2.2.52.4 bekezdésben fel nem sorolt szerves peroxid vagy szerves peroxid készítmény mintákat, amelyekre nézve nem áll rendelkezésre teljes körű vizsgálati eredmény és szállításuk további vizsgálatok és értékelés céljából történik, a C típusú szerves peroxidokra vonatkozó, megfelelő tételhez kell hozzárendelni, feltéve, hogy megfelelnek a következő feltételeknek:

- a rendelkezésre álló adatokból kitűnik, hogy a minta nem veszélyesebb, mint egy B típusú szerves peroxid;
- a minta az OP2 csomagolási módszer szerint van csomagolva és mennyisége kocsinként nem haladja meg a 10 kg-ot.

A hőmérséklet-szabályozást igénylő minták a vasúti fuvarozásból ki vannak zárva.

*A szerves peroxidok érzéketlenítése*

- 2.2.52.1.10** A biztonságos szállítás céljából a szerves peroxidokat számos esetben szerves folyadékokkal vagy szilárd anyagokkal, szerves szilárd anyagokkal vagy vízzel érzéketlenítik. Amennyiben valamely anyag százalékos tartalma meg van határozva, ez tömeg%-ot jelent, egész számra kerekítve. Általában az érzéketlenítést úgy kell végrehajtani, hogy kifolyás esetén a szerves peroxid veszélyes mértékű koncentrálódása ne következhesen be.

- 2.2.52.1.11** Hacsak az egyes szerves peroxid készítményekre nincs más előírva, az érzéketlenítésre használt hígítóra a következő meghatározások érvényesek:

- az A típusú hígítók olyan szerves folyadékok, amelyek összeférhetők a szóban forgó szerves peroxiddal és forráspontjuk legalább 150 °C. Az A típusú hígítók minden szerves peroxid érzéketlenítéséhez felhasználhatók;
- a B típusú hígítók szerves folyadékok, amelyek összeférhetők a szerves peroxiddal és amelyek forráspontja 150 °C-nál kisebb, de legalább 60 °C és lobbanáspontja legalább 5 °C.

A B típusú hígítók minden szerves peroxid érzéketlenítésére használhatók, amennyiben a hígító forráspontja legalább 60 °C-kal magasabb, mint a szerves peroxid ÖBH értéke 50 kg-os küldeménydarabban.

**2.2.52.1.12** Az A vagy B típusú hígítóktól eltérő típusú hígítók is használhatók a 2.2.52.4 bekezdésben felsorolt szerves peroxid készítményekhez, amennyiben azokkal összeférhetők. Azonban az A vagy B típusú hígítók helyettesítése részben vagy teljes mértékben más, eltérő tulajdonságokkal bíró hígítókkal szükségessé teszi a készítmény ismételt minősítését az 5.2 osztályra vonatkozó normál besorolási eljárás szerint.

**2.2.52.1.13** A víz csak olyan szerves peroxidokhoz használható érzéketlenítőszerként, amelyek a 2.2.52.4 bekezdésben fel vannak sorolva, vagy az illetékes hatóság 2.2.52.1.8 pont szerinti jóváhagyásában mint „víz hozzáadásával” vagy mint „stabil vizes diszperziók” vannak megemlítve. A 2.2.52.4 bekezdésben fel nem sorolt szerves peroxid mintákat vagy szerves peroxid készítmény mintákat is lehet vízzel érzéketleníteni, amennyiben a 2.2.52.1.9 pont előírásainak megfelelnek.

**2.2.52.1.14** Szerves és szervesetlen szilárd anyagokat csak akkor szabad a szerves peroxidok érzéketlenítésére használni, ha ezekkel összeférhetők. A folyékony és a szilárd anyagok akkor tekinthetők összeférhetőnek, ha nem befolyásolják hátrányosan a szerves peroxid készítménynek sem termikus stabilitását, sem veszélyességét.

**2.2.52.1.15–  
2.2.52.1.18**

(fenntartva).

**2.2.52.2** *A fuvarozásból kizárt anyagok*

A következő szerves peroxidok az 5.2 osztály feltételei mellett a fuvarozásból ki vannak zárva:

- A típusú szerves peroxidok [lásd a „Vizsgálatok és kritériumok kézikönyv” II. rész 20.4.3 a) pontját].

A következő szerves peroxidok, amelyek hőmérséklet-szabályozást igényelnek, a vasúti fuvarozásból ki vannak zárva:

- a B és C típusú szerves peroxidok  $\leq 50$  °C öngyorsuló bomlási hőmérséklet (ÖBH) értékkel:

3111 B TÍPUSÚ, FOLYÉKONY SZERVES PEROXID HŐMÉRSÉKLET-SZABÁLYOZÁSSAL;

3112 B TÍPUSÚ, SZILÁRD SZERVES PEROXID HŐMÉRSÉKLET-SZABÁLYOZÁSSAL;

3113 C TÍPUSÚ, FOLYÉKONY SZERVES PEROXID HŐMÉRSÉKLET-SZABÁLYOZÁSSAL;

3114 C TÍPUSÚ, SZILÁRD SZERVES PEROXID HŐMÉRSÉKLET-SZABÁLYOZÁSSAL;

- D típusú szerves peroxidok, amelyek zárt térben hevítve erőlyes vagy mérsékelt reakciót

mutatnak  $\leq 50$  °C ÖBH mellett, vagy amelyek zárt térben hevítve gyenge vagy semmilyen reakciót nem mutatnak  $\leq 45$  °C ÖBH mellett:

3115 D TÍPUSÚ, FOLYÉKONY SZERVES PEROXID HŐMÉRSÉKLET-SZABÁLYOZÁSSAL;

3116 D TÍPUSÚ, SZILÁRD SZERVES PEROXID HŐMÉRSÉKLET-SZABÁLYOZÁSSAL;

– E és F típusú szerves peroxidok  $\leq 45$  °C ÖBH-val:

3117 E TÍPUSÚ, FOLYÉKONY SZERVES PEROXID HŐMÉRSÉKLET-SZABÁLYOZÁSSAL;

3118 E TÍPUSÚ, SZILÁRD SZERVES PEROXID HŐMÉRSÉKLET-SZABÁLYOZÁSSAL;

3119 F TÍPUSÚ, FOLYÉKONY SZERVES PEROXID HŐMÉRSÉKLET-SZABÁLYOZÁSSAL;

3120 F TÍPUSÚ, SZILÁRD SZERVES PEROXID HŐMÉRSÉKLET-SZABÁLYOZÁSSAL.

**2.2.52.3 A gyűjtőmegnevezések felsorolása**

	Osztályzási kód	UN szám	Az anyag vagy tárgy megnevezése

**Megjegyzés:** (lásd a 2.2.52.4 bekezdés táblázatának utolsó oszlopát)

- 1) B típusú hígító mindig kicserélhető A típusú hígítóra. A B típusú hígító forráspontjának legalább 60 °C-kal magasabbnak kell lennie, mint a szerves peroxid ÖBH értéke.
- 2) Szabad oxigéntartalom ≤ 4,7%.
- 3) „ROBBANÁSVESZÉLY” járulékos veszély bárca szükséges (1 sz. bárca, lásd az 5.2.2.2.2 pontot).
- 4) A hígító helyettesíthető di-terc-butil-peroxiddal.
- 5) Szabad oxigéntartalom ≤ 9%.
- 6) (fenntartva)
- 7) (fenntartva)
- 8) Szabad oxigéntartalom > 10% és ≤ 10,7%, vízzel vagy víz nélkül.
- 9) Szabad oxigéntartalom ≤ 10%, vízzel vagy víz nélkül.
- 10) Szabad oxigéntartalom ≤ 8,2%, vízzel vagy víz nélkül.
- 11) Lásd a 2.2.52.1.9 pontot.
- 12) Tartályonként 2000 kg-ig a nagy méreteken végzett vizsgálatok alapján az F TÍPUSÚ SZERVES PEROXID alá sorolva.
- 13) „MARÓ” járulékos veszély bárca szükséges (8 sz. bárca, lásd az 5.2.2.2.2 pontot).
- 14) Peroxi-ecetsav készítmények, amelyek a „Vizsgálatok és kritériumok kézikönyv” 20.4.3 d) pontjának megfelelnek.
- 15) Peroxi-ecetsav készítmények, amelyek a „Vizsgálatok és kritériumok kézikönyv” 20.4.3 e) pontjának megfelelnek.
- 16) Peroxi-ecetsav készítmények, amelyek a „Vizsgálatok és kritériumok kézikönyv” 20.4.3

*f) pontjának megfelelnek.*

- 17) *Víz hozzáadásával a szerves peroxid termikus stabilitása csökken.*
- 18) *80% alatti koncentrációnál nincs szükség „MARÓ” járulékos veszély bárcára (8 sz. bárca, lásd az 5.2.2.2.2 pontot).*
- 19) *Keverékek hidrogén-peroxiddal, vízzel és savakkal.*
- 20) *A típusú hígítóval, vízzel vagy anélkül.*
- 21) *Legalább 25 tömeg% A típusú hígítóval és ezenkívül etil-benzollal.*
- 22) *Legalább 19 tömeg% A típusú hígítóval és ezenkívül metil-izobutil-ketonnal.*
- 23) *6%-nál kevesebb di-terc-butil-peroxiddal.*
- 24) *Legfeljebb 8% 1-izopropil-hidroperoxi-4-izopropil-hidroxi-benzollal.*
- 25) *B típusú hígító 110 °C-nál nagyobb forrásponttal.*
- 26) *0,5%-nál kisebb hidroperoxid tartalommal.*
- 27) *56% feletti koncentrációnál „MARÓ” járulékos veszély bárca szükséges (8 sz. bárca, lásd az 5.2.2.2.2 pontot).*
- 28) *Szabad aktív oxigéntartalom  $\leq 7,6\%$ , A típusú hígítóban, amelynek legalább 95%-a csak 200 °C – 260 °C között párolog el.*
- 29) *Nem tartozik a RID 5.2 osztályra vonatkozó előírásainak hatálya alá.*
- 30) *B típusú hígító 130 °C-nál nagyobb forrásponttal.*
- 31) *Aktív oxigéntartalom  $\leq 6,7\%$ .*

**2.2.61            6.1 osztály      Mérgező anyagok****2.2.61.1            *Kritériumok***

**2.2.61.1.1**      A 6.1 osztály fogalomköre azokra a mérgező anyagokra terjed ki, amelyekről tapasztalat alapján tudják vagy amelyekről állatokon végzett kísérletek alapján feltételezhető, hogy viszonylag csekély mennyiségben, egyszeri vagy rövid ideig tartó behatással, belélegzés, bőrrel való érintkezés vagy lenyelés útján károsíthatják az emberi egészséget vagy halált okozhatnak.

**2.2.61.1.2**      A 6.1 osztály anyagai a következők szerint vannak csoportosítva:

T      Mérgező anyagok járulékos veszély nélkül:

T1      Szerves folyékony anyagok

T2      Szerves szilárd anyagok

T3      Szerves fémvegyületek

T4      Szervetlen folyékony anyagok

T5      Szervetlen szilárd anyagok

T6      Peszticidként használt folyékony anyagok

T7      Peszticidként használt szilárd anyagok

T8      Minták

T9      Egyéb mérgező anyagok

TF      Mérgező, gyúlékony anyagok:

TF1      Folyékony anyagok

TF2      Peszticidként használt folyékony anyagok

TF3      Szilárd anyagok

TS      Mérgező, önmelegedő, szilárd anyagok

TW      Mérgező anyagok, amelyek vízzel érintkezve gyúlékony gázokat fejlesztenek:

TW1      Folyékony anyagok

TW2      Szilárd anyagok

TO      Mérgező, gyújtó hatású anyagok:

TO1      Folyékony anyagok

TO2      Szilárd anyagok

TC      Mérgező, maró anyagok:

TC1      Szerves folyékony anyagok

TC2      Szerves szilárd anyagok

TC3      Szervetlen folyékony anyagok

TC4      Szervetlen szilárd anyagok

TFC      Mérgező, gyúlékony, maró anyagok.

*Fogalommeghatározások***2.2.61.1.3** A RID alkalmazásában

A *heveny mérgezőképesség LD<sub>50</sub> (közepes halálos dózis) értéke lenyelés esetén* az anyag statisztikailag számított egyszeri dózisa, amely lenyelés esetén várhatóan a fiatal, felnőtt, fehér patkányok 50%-ánál okoz 14 napon belüli halált. Az LD<sub>50</sub> értéket a vizsgált anyag beadott mennyiségének a vizsgált állatok testtömegére vonatkoztatott arányával (mg/kg) fejezik ki.

A *heveny mérgezőképesség LD<sub>50</sub> értéke bőrön át való felszívódás esetén* az a dózis, amely ha fehér nyulak csupasz bőrével 24 órán át folyamatosan érintkezésbe került, nagy valószínűséggel 14 napon belül halált okoz a kísérleti állatok felénél. A kísérleti állatok számának elegendőnek kell lenni ahhoz, hogy az eredmény statisztikailag szignifikáns legyen és megfeleljen a jó gyógyszerészeti gyakorlatnak. Az eredményt testtömegre vonatkoztatva mg/kg-ban fejezik ki.

A *heveny mérgezőképesség LC<sub>50</sub> értéke belélegzés esetén* az a gőz, köd vagy porkoncentráció, amely egy órán át tartó folyamatos belélegzés esetén fiatal, felnőtt, hím és nőstény, fehér patkányok csoportjának egyaránt felénél nagy valószínűséggel 14 napon belüli halált okoz. Szilárd anyagot akkor kell így vizsgálni, ha az anyag össz mennyiségének legalább 10 tömeg%-a belélegezhető por, azaz ezen részecskefrakció aerodinamikai átmérője 10 µm vagy ennél kisebb. Folyékony anyagot akkor kell így vizsgálni, ha a szállított anyag szivárgása esetén fennáll a ködképződés lehetősége. Mind szilárd, mind folyékony anyag esetén a belélegzési mérgezőképesség vizsgálatára előkészített minta több mint 90 tömeg%-ának az előzőekben meghatározott belélegezhető tartományban kell lennie. Az eredményt egységnyi térfogatú levegőre vonatkoztatva adják meg, por és köd esetén mg/liter-ben, gőz esetén milliliter/m<sup>3</sup>-ben (ppm-ben).

*Besorolás és csomagolási csoporthoz való hozzárendelés***2.2.61.1.4** A 6.1 osztály anyagait a szállítás során általuk képviselt veszély mértéke szerint a következő három csomagolási csoport valamelyikéhez kell hozzárendelni:

- I csomagolási csoport: nagyon mérgező anyagok;
- II csomagolási csoport: mérgező anyagok;
- III csomagolási csoport: enyhén mérgező anyagok.

**2.2.61.1.5** A 6.1 osztályba sorolt anyagokat, keverékeket, oldatokat és tárgyakat a 3.2 fejezet „A” táblázata sorolja fel. A 3.2 fejezet „A” táblázatában név szerint nem említett anyagokat, keverékeket és oldatokat a 2.1 fejezet szerinti a 2.2.61.3 bekezdés megfelelő tétele alá és a megfelelő csomagolási csoportba a 2.2.61.1.6 – 2.2.61.1.11 pontban található kritériumok alapján kell besorolni.**2.2.61.1.6** A mérgezési veszély megállapításához számításba kell venni az embereken bekövetkezett véletlen mérgezési esetek tapasztalatait, valamint az egyes anyagok különleges tulajdonságait, mint a folyékony halmazállapotot, nagymértékű illékonyságot, a bőrön át való felszívódás valószínűségét, különleges biológiai hatásokat.**2.2.61.1.7** Embereken történt megfigyelések hiányában a mérgezési veszélyt állatokon végzett kísérletekből származó, rendelkezésre álló adatok segítségével a következő táblázatnak megfelelően kell meghatározni:

	Csomagolási csoport	Mérgezőképesség lenyelés esetén, $LD_{50}$ (mg/kg)	Mérgezőképesség bőrön át való felszívódás esetén, $LD_{50}$ (mg/kg)	Mérgezőképesség por és köd belélegzése esetén, $LC_{50}$ (mg/l)
Nagyon mérgező	I	$LD_{50} \leq 5$	$LD_{50} \leq 50$	$LC_{50} \leq 0,2$
Mérgező	II	$5 < LD_{50} \leq 50$	$50 < LD_{50} \leq 200$	$0,2 < LC_{50} \leq 2$
Enyhén mérgező	III <sup>a)</sup>	$50 < LD_{50} \leq 300$	$200 < LD_{50} \leq 1000$	$2 < LC_{50} \leq 4$

a) A könnygáz anyagokat a II csomagolási csoportba kell sorolni, még ha mérgezőképességük a III csomagolási csoport értékeinek felel is meg.

**2.2.61.1.7.1** Ha egy anyag két vagy több mérgezési mód esetén különböző mérgezőképességű, a legnagyobb mérgezőképesség szerint kell besorolni.

**2.2.61.1.7.2** A 8 osztály kritériumait kielégítő anyagok az I csomagolási csoportnak megfelelő por és köd belélegzési mérgezőképességgel ( $LC_{50}$ ) csak akkor fogadhatók el a 6.1 osztályba történő besoroláshoz, ha lenyelés vagy bőrön át való felszívódás esetére vonatkozó mérgezőképességük alapján legalább az I vagy a II csomagolási csoportba tartoznak. Ellenkező esetben a 8 osztályba történő besorolást kell végezni, ha az lehetséges (lásd a 2.2.8.1.5 pontot).

**2.2.61.1.7.3** Por és köd belélegzése esetén a mérgezőképesség kritériuma az 1 órán át tartó belélegzés  $LC_{50}$  adatain alapul. Ahol ezek az adatok rendelkezésre állnak, ezeket kell használni. Amennyiben csak a 4 órán át tartó belélegzés  $LC_{50}$  adatai állnak rendelkezésre, ezek négyszeresével lehet helyettesíteni az előző értéket, vagyis a 4 órás  $LC_{50}$  négyszerese egyenlőnek tekinthető az 1 órás  $LC_{50}$ -nel.

*Mérgezőképesség gőz belélegzése esetén*

**2.2.61.1.8** A mérgező gőzöket kibocsátó folyadékokat a következő csoportok alá kell besorolni, ahol „V” jelenti a telített gőz koncentrációját ( $\text{ml/m}^3$  levegő egységben) (illékonyság) 20 °C-on és normál atmoszferikus nyomáson.

A mérgező hatás fokozata	Csomagolási csoport	Feltétel
Nagyon mérgező	I	ha $V \geq 10LC_{50}$ és $LC_{50} \leq 1000 \text{ ml/m}^3$
Mérgező	II	ha $V \geq LC_{50}$ és $LC_{50} \leq 3000 \text{ ml/m}^3$ és az I csomagolási csoport kritériumai nem teljesülnek
Enyhén mérgező	III <sup>a)</sup>	ha $V \geq 0,2LC_{50}$ és $LC_{50} \leq 5000 \text{ ml/m}^3$ és sem az I, sem a II csomagolási csoport kritériumai nem teljesülnek

a) A könnygáz anyagokat a II csomagolási csoportba kell sorolni, még ha mérgezőképességük a III csomagolási csoport értékeinek felel is meg.

Gőz belélegzése esetén a mérgezőképesség kritériuma az 1 órán át tartó belélegzés  $LC_{50}$  adatain alapul. Ahol ezek az adatok rendelkezésre állnak, ezeket kell használni.

Amennyiben csak a 4 órán át tartó belélegzés  $LC_{50}$  adatai állnak rendelkezésre, ezek kétszeresével lehet helyettesíteni az előző értéket, vagyis a 4 órás  $LC_{50}$  kétszerese egyenlőnek tekinthető az 1 órás  $LC_{50}$ -nel.

Az ábra a besorolás megkönnyítésére grafikusán ábrázolja a mérgezési kritériumokat. Mivel a grafikus ábrázolás közelítő pontosságú, az egyes csomagolási csoportok határvonalára vagy azok közelébe eső anyagokat a számszerű kritériumok alapján kell ellenőrizni.

#### *Folyékony anyagok keverékei*

**2.2.61.1.9** A folyékony anyagok olyan keverékeit, amelyek a belélegzési mérgezés veszélyével bírnak, a következő kritériumok szerint kell a veszélyességi kategóriák alá besorolni:

**2.2.61.1.9.1** Ha a keveréket alkotó minden egyes mérgező anyagra az  $LC_{50}$  értéke ismeretes, a csomagolási csoportot a következők szerint kell meghatározni:

a) a keverék  $LC_{50}$  értékének kiszámítása:

$$LC_{50}(\text{keverék}) = \frac{1}{\sum_{i=1}^n \frac{f_i}{LC_{50i}}}, \text{ ahol}$$

$f_i$  = a keverék  $i$ -edik alkotórészének molaránya;

$LC_{50i}$  = az  $i$ -edik alkotórész átlagos halálos koncentrációja  $\text{ml/m}^3$ -ben;

b) az egyes alkotórészek illékonyságának kiszámítása:

$$V_i = P_i \times \frac{10^6}{101,3} \text{ ml/m}^3, \text{ ahol}$$

$P_i$  = az  $i$ -edik alkotórész parciális nyomása kPa-ban 20 °C-on és normál atmoszférikus nyomáson;

c) az illékonyági arány kiszámítása  $LC_{50}$ -re:

$$R = \sum_{i=1}^n \frac{V_i}{LC_{50i}};$$

d) felhasználva az  $LC_{50}$  (keverék) és  $R$  kiszámított értékét, a keverékére meghatározható a csoport:

I csomagolási csoport	$R \leq 10$ és $LC_{50}$ (keverék) $\leq 1000 \text{ ml/m}^3$ ;
II csomagolási csoport	$R \leq 1$ és $LC_{50}$ (keverék) $\leq 3000 \text{ ml/m}^3$ , ha a keverék az I csomagolási csoport kritériumainak nem felel meg;
III csomagolási csoport	$R \leq 1/5$ és $LC_{50}$ (keverék) $\leq 5000 \text{ ml/m}^3$ , ha a keverék sem az I, sem a II csomagolási csoport kritériumainak nem felel meg.

**2.2.61.1.9.2** A mérgező alkotórészekre vonatkozó  $LC_{50}$  értékek hiányában a keverék a következő egyszerűsített mérgezési küszöb próbák alapján rendelhető valamely csoporthoz. Ha ilyen mérgezési küszöb vizsgálatokat használunk, meg kell határozni a leginkább korlátozó csoportot és ezt kell használni a keverék szállításához.

**2.2.61.1.9.3** Valamely keverék csak akkor sorolható a I csomagolási csoportba, ha mindkét következő kritériumot teljesíti:

- A folyékony keverék mintáját elpárologtatjuk és levegővel hígítjuk  $1000 \text{ ml/m}^3$  elpárologtatott keverék vizsgálati atmoszférát alakítva ki a levegőben. Tíz fehér patkányt (öt hímet és öt nőtényt) egy órán át kiteszünk a vizsgálati atmoszférának és tizennégy napon keresztül megfigyeljük azokat. Ha a tizennégy napos megfigyelési időszak alatt öt vagy több állat hullik el, a keverék feltételezeten  $1000 \text{ ml/m}^3$  vagy ennél kisebb  $LC_{50}$  értékkel rendelkezik.
- A folyékony keverékkel egyensúlyban levő gőzmintát 9-szeres levegőtérfogattal hígítjuk a vizsgálati atmoszféra kialakításához. Tíz fehér patkányt (öt hímet és öt nőtényt) egy órán át kiteszünk a vizsgálati atmoszférának és tizennégy napon keresztül megfigyeljük azokat. Ha a tizennégy napos megfigyelési időszak alatt öt vagy több állat hullik el, a keverék feltételezeten a keverék  $LC_{50}$  értékének 10-szeresével egyenlő vagy nagyobb illékonysággal rendelkezik.

**2.2.61.1.9.4** Valamely keverék csak akkor sorolható a II csomagolási csoportba, ha mindkét következő kritériumot teljesíti és a keverék nem elégti ki az I csomagolási csoportra vonatkozó kritériumokat:

- A folyékony keverék mintáját elpárologtatjuk és levegővel hígítjuk  $3000 \text{ ml/m}^3$  elpárologtatott keverék vizsgálati atmoszférát alakítva ki a levegőben. Tíz fehér patkányt (öt hímet és öt nőtényt) egy órán át kiteszünk a vizsgálati atmoszférának és tizennégy napon keresztül megfigyeljük azokat. Ha a tizennégy napos megfigyelési időszak alatt öt vagy több állat hullik el, a keverék feltételezeten  $3000 \text{ ml/m}^3$  vagy ennél kisebb  $LC_{50}$  értékkel rendelkezik.
- A folyékony keverékkel egyensúlyban levő gőzmintát használjuk a vizsgálati atmoszféra kialakításához. Tíz fehér patkányt (öt hímet és öt nőtényt) egy órán át kiteszünk a vizsgálati atmoszférának és tizennégy napon keresztül megfigyeljük azokat. Ha a tizennégy napos megfigyelési időszak alatt öt vagy több állat hullik el, a keverék feltételezeten a keverék  $LC_{50}$  értékével egyenlő vagy nagyobb illékonysággal rendelkezik.

**2.2.61.1.9.5** Valamely keverék csak akkor sorolható a III csomagolási csoportba, ha mindkét következő kritériumot teljesíti és a keverék nem elégti ki sem az I, sem a II csomagolási csoportra vonatkozó kritériumokat:

- A folyékony keverék mintáját elpárologtatjuk és levegővel hígítjuk  $5000 \text{ ml/m}^3$  elpárologtatott keverék vizsgálati atmoszférát alakítva ki a levegőben. Tíz fehér patkányt (öt hímet és öt nőtényt) egy órán át kiteszünk a vizsgálati atmoszférának és tizennégy napon keresztül megfigyeljük azokat. Ha a tizennégy napos megfigyelési időszak alatt öt vagy több állat hullik el, a keverék feltételezeten  $5000 \text{ ml/m}^3$  vagy

ennél kisebb  $LC_{50}$  értékkel rendelkezik.

- b) A folyékony keverék gőzkoncentrációját megmérjük és ha a gőzkoncentráció  $1000 \text{ ml/m}^3$ -rel egyenlő vagy annál nagyobb, az illékonyság feltételezeten a keverék  $LC_{50}$  értékének  $1/5$ -ével egyenlő vagy annál nagyobb.

*A keverékek lenyelési és bőrön keresztüli mérgezőképességének meghatározására szolgáló módszerek*

**2.2.61.1.10** A keverékek 6.1 osztályba történő besorolásához és a megfelelő csomagolási csoport meghatározásához a lenyelési és bőrön keresztüli mérgezőképesség alapján (lásd a 2.2.61.1.3 pontot) meg kell határozni a keverék heveny  $LD_{50}$  értékét.

**2.2.61.1.10.1** Ha a keverék csak egy hatóanyagot tartalmaz, és ennek az  $LD_{50}$  értéke ismeretes, a szállítandó keverékre megbízható lenyelési vagy bőrön keresztüli heveny mérgezőképességi adatok hiányában a lenyelési  $LD_{50}$  érték a következő képlettel határozható meg:

$$a \text{ készítmény } LD_{50} \text{ értéke} = \frac{a \text{ hatóanyag } LD_{50} \text{ értéke} \times 100}{a \text{ hatóanyag tömegszázaléka}}.$$

**2.2.61.1.10.2** Ha a keverék egynél több hatóanyagot tartalmaz, három módszer lehetséges a keverék lenyelési vagy bőrön keresztüli  $LD_{50}$  értékének meghatározására. A legalkalmasabb módszer a szállítandó keverékre megbízható lenyelési vagy bőrön keresztüli mérgezőképességi adatok beszerzése. Ha megbízható, pontos adatok nem állnak rendelkezésre, akkor a következő módszerek valamelyike használható:

- a) A készítményt a keverék legveszélyesebb alkotórésze alapján soroljuk be, mintha ez az alkotórész olyan koncentrációban lenne jelen, mint az összes hatóanyag együttesen; vagy
- b) A következő képletet alkalmazzuk:

$$\frac{C_A}{T_A} + \frac{C_B}{T_B} + \dots + \frac{C_Z}{T_Z} = \frac{100}{T_M}$$

ahol:

$C$  = a keverékben az A, B, ... Z alkotórész %-os koncentrációja;

$T$  = az A, B, ... Z alkotórész lenyelési  $LD_{50}$  értéke;

$T_M$  = a keverék lenyelési  $LD_{50}$  értéke.

**Megjegyzés:** Ez a képlet használható a bőrön keresztüli mérgezőképesség meghatározásához is, amennyiben ez az információ ugyanarra a fajra vonatkozóan minden alkotórészre rendelkezésre áll. E képlet használata nem veszi figyelembe az erősítő vagy védő hatásokat.

*Peszticidek besorolása*

**2.2.61.1.11** Minden peszticid hatóanyagot és ezek készítményeit, amelyekre az  $LC_{50}$  és/vagy az  $LD_{50}$  érték ismeretes és amelyek a 6.1 osztályba vannak besorolva, a 2.2.61.1.6 – 2.2.61.1.9 pontban található kritériumok szerint kell a megfelelő csomagolási csoporthoz hozzárendelni. Azokat az anyagokat és készítményeket, amelyeknek járulékos veszélye van, a 2.1.3.10 bekezdésben található veszélyességi rangsor táblázat alapján kell besorolni és a megfelelő csomagolási csoporthoz hozzárendelni.

**2.2.61.1.11.1** Ha a peszticid készítmény lenyelési vagy bőrön keresztüli mérgezőképesség  $LD_{50}$  értéke nem

ismeretes, de hatóanyagainak  $LD_{50}$  értéke ismeretes, akkor a készítmény  $LD_{50}$  értéke a 2.2.61.1.10 pontban leírt eljárás alkalmazásával határozható meg.

**Megjegyzés:** A használatos peszticidekre vonatkozóan  $LD_{50}$  mérgezőképességi adatok találhatóak a „WHO Ajánlás a peszticidek osztályozására veszélyességük alapján és az osztályozási irányelvek” kiadványban, amely az International Programme on Chemical Safety, World Health Organization (WHO), CH-1211 Geneva 27, Switzerland címen szerezhető be. Bár ez a dokumentum felhasználható a peszticidek  $LD_{50}$  értékeinek forrásaként, ennek osztályozási rendszere nem használható a peszticidek szállítási besorolásához és a csomagolási csoportokhoz történő hozzárendeléséhez, azt a RID előírásai szerint kell elvégezni.

**2.2.61.1.11.2** A peszticid szállításánál használt helyes szállítási megnevezést a hatóanyag, a peszticid halmazállapota és a lehetséges járulékos veszélyek alapján kell megválasztani (lásd a 3.1.2 szakaszt).

**2.2.61.1.12** Ha a 6.1 osztály anyagai valamilyen adalékanyag hozzáadása révén eltérő veszélyességi kategóriákba kerülnek át, mint ahová 3.2 fejezet „A” táblázatában név szerint említett anyagok, ezeket a keverékeket vagy oldatokat azok alá a tételek alá kell besorolni, ahová tényleges veszélyességük mértéke alapján tartoznak.

**Megjegyzés:** Az oldatok és keverékek (készítmények és hulladékok) besorolására lásd a 2.1.3 szakaszt is.

**2.2.61.1.13** A 2.2.61.1.6 – 2.2.61.1.11 bekezdésben található kritériumok alapján az is meghatározható, hogy egy név szerint feltüntetett anyag vagy név szerint feltüntetett anyagot tartalmazó oldat vagy keverék természete olyan, hogy az oldat vagy keverék nem esik ezen osztály előírásainak hatálya alá.

**2.2.61.1.14** Azok az anyagok, oldatok és keverékek – kivéve a peszticidként használt anyagokat és készítményeket –, amelyek a módosított 67/548/EGK<sup>4)</sup> vagy az 1999/45/EK<sup>5)</sup> Irányelv kritériumai alapján, ezen irányelvek szerint nem számítanak nagyon mérgezőnek, mérgezőnek vagy ártalmasnak, a 6.1 osztályba nem tartozó anyagoknak tekinthetők.

**2.2.61.2** *A fuvarozásból kizárt anyagok*

**2.2.61.2.1** A 6.1 osztály vegyileg nem állandó anyagai csak akkor adhatók át szállításra, ha megtették a szükséges intézkedéseket, hogy megakadályozzák a szállítás alatti veszélyes bomlásukat vagy polimerizációjukat. Ennek elérésére különösen azt kell biztosítani, hogy a tartályok, ill. tartányok ne tartalmazzanak olyan anyago(ka)t, amelyek ilyen reakciókat okozhatnak.

**2.2.61.2.2** A következő anyagok a fuvarozásból ki vannak zárva:

- azok a vízmentes vagy oldatban levő hidrogén-cianidok, amelyek nem felelnek meg az UN 1051, 1613, 1614 vagy 3294 tétel leírásának;
- a fém-karbonilok, amelyek lobbanáspontja 23 °C alatt van, az UN 1259 nikkel-tetra-karbonil és az UN 1994 vas-pentakarbonil kivételével;

4) Az Európai Közösségek Tanácsának 1967. június 27-i 67/548/EGK Irányelve a tagállamok veszélyes anyagok osztályozására, csomagolására és címkézésére vonatkozó jogszabályainak és közigazgatási előírásainak közelítéséről (lásd az EK Hivatalos Lapja, L 196. szám, 1967.08.16.).

5) Az Európai Parlament és a Tanács 1999. május 31-i 1999/45/EK Irányelve a tagállamok veszélyes készítmények osztályozására, csomagolására és címkézésére vonatkozó jogszabályainak és közigazgatási előírásainak közelítéséről (lásd az EK Hivatalos Lapja, L 200. szám, 1999.07.30., p. 1-68.).

- a 2,3,7,8-tetraklór-dibenzo-p-dioxin (TCDD) olyan koncentrációban, amely a 2.2.61.1.7 pontban foglalt feltételek alapján nagyon mérgező;
- az UN 2249 diklór-dimetil-éter, szimmetrikus;
- a foszfid készítmények a mérgező, gyúlékony gázok fejlődését gátló adalékok nélkül.

A következő anyagok a vasúti fuvarozásból ki vannak zárva:

- UN 0224 bárium-azid, száraz vagy 50%-nál kevesebb víztartalommal;
- UN 0135 higany-fulminát, nedvesített.

## 2.2.61.3 A gyűjtőmegnevezések felsorolása

Járálekos veszély	Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
Mérgező anyagok járálekos veszély nélkül

## Megjegyzés:

- A peszticidként használt, alkaloidokat vagy nikotint tartalmazó anyagokat és készítményeket az UN 2588 szilárd, mérgező peszticid, m.n.n., a 2902 folyékony, mérgező peszticid, m.n.n. vagy a 2903 folyékony, mérgező, gyúlékony peszticid, m.n.n. tétel alá kell besorolni.
- A laboratóriumi vagy kísérleti célokra, valamint gyógyszerészeti termékek gyártására használt hatóanyagokat, ill. ezek más anyagokkal alkotott finom porát (tritúrátumát) és keverékét mérgezőképességük alapján kell besorolni (lásd 2.2.61.1.7 – 2.2.61.1.11).
- Az enyhén mérgező, önmelegedő anyagok és az öngyulladó szerves fémvegyületek a 4.2 osztály anyagai.
- Az enyhén mérgező, vízzel reaktív anyagok és a vízzel reaktív szerves fémvegyületek a 4.3 osztály anyagai.
- A higany-fulminát legalább 20 tömeg% vízzel (vagy víz és alkohol keverékével) nedvesítve az 1 osztály UN 0135 számú anyaga és a vasúti fuvarozásból ki van zárva (lásd a 2.2.61.2.2 pontot).
- A ferri-cianidok, a ferro-cianidok és az alkáli-tiocianátok nem esnek a RID előírásainak hatálya alá.
- Azok az ólomsók és ólompigmentek, amelyek a 0,07 M sósavoldattal 1:1000 arányban vegyítve, 23 °C ± 2 °C-on történő, egy órán keresztül tartó keverés után legfeljebb 5%-ban oldódnak, nem tartoznak a RID előírásainak hatálya alá.
- Az ilyen peszticiddal átitatott tárgyak, mint pl. papírtányérok, papírszalagok, vattacsomók, műanyag lapok stb. légmentesen zárt burkolatban nem tartoznak a RID előírásainak hatálya alá.
- A RID előírásainak hatálya alá nem tartozó szilárd anyagok és mérgező folyékony

*anyagok keverékei az UN 3243 tétel alatt szállíthatók anélkül, hogy a 6.1 osztály besorolási kritériumait alkalmazni kellene, amennyiben az anyag berakodása során, ill. a csomagolóeszköz, a konténer vagy a kocsi lezárása során szabad folyadék szemmel nem látható. Minden csomagolóeszköznek meg kell felelni a gyártási mintának, ami sikeresen elviselte a II csomagolási csoportra vonatkozó tömörségi próbát. Ez a tétel nem használható az I csomagolási csoportba tartozó folyadékot tartalmazó szilárd anyagokhoz.*

- j) A nagyon mérgező vagy mérgező, gyúlékony, folyékony anyagok 23 °C alatti lobbanásponttal – az UN 1051, 1092, 1098, 1143, 1163, 1182, 1185, 1238, 1239, 1244, 1251, 1259, 1613, 1614, 1695, 1994, 2334, 2382, 2407, 2438, 2480, 2482, 2484, 2485, 2606, 2929, 3279 és 3294 szám alá tartozó, belélegzés esetén nagyon mérgező anyagok kivételével – a 3 osztály anyagai.*
- k) Azok a gyúlékony folyékony anyagok, amelyek enyhén mérgezőek, a peszticidként használt anyagok és készítmények kivételével, 23 °C és 60 °C közötti lobbanásponttal a 3 osztály anyagai.*
- l) Az enyhén mérgező, gyújtó hatású anyagok az 5.1 osztály anyagai.*
- m) Az enyhén mérgező és gyengén maró anyagok a 8 osztály anyagai.*
- n) Az UN 1360, 1397, 1432, 1714, 2011 és 2013 szám alá besorolt fémfoszfidok a 4.3 osztály anyagai.*

**2.2.62            6.2 osztály        Fertőző anyagok****2.2.62.1            *Kritériumok***

**2.2.62.1.1**        A 6.2 osztály fogalmkörébe a fertőző anyagok tartoznak. A RID értelmében a fertőző anyagok olyan anyagok, amelyekről ismert vagy okkal feltételezhető, hogy kórokozókat tartalmaznak. A kórokozók olyan mikroorganizmusok (beleértve a baktériumokat, vírusokat, rickettsiákat, parazitákat, gombákat) és más hatóanyagok, pl. a prionok, amelyek képesek ember vagy állat megbetegedését okozni.

*Megjegyzés: 1. A géntechnológiával módosított mikroorganizmusokat és élő szervezeteket, biológiai termékeket, diagnosztikai mintákat és fertőzött élő állatokat ebbe az osztályba kell besorolni, ha kielégítik ennek az osztálynak a feltételeit.*

*2. Azok a növényi, állati vagy baktérium forrásokból származó toxinok, amelyek nem tartalmaznak semmiféle fertőző anyagot vagy élő szervezetet, vagy nem fertőző anyagban vagy élő szervezetben vannak, a 6.1 osztály UN 3172 vagy UN 3462 szám alá tartozó anyagok.*

**2.2.62.1.2**        A 6.2 osztály anyagai a következők szerint vannak csoportosítva:

- I1    Emberekre ártalmas, fertőző anyagok
- I2    Csak állatokra ártalmas, fertőző anyagok
- I3    Kórházi hulladék
- I4    Biológiai anyagok.

*Fogalommeghatározások*

**2.2.62.1.3**        A RID alkalmazásában:

*Biológiai termékek* azok a termékek, amelyeket élő szervezetekből az illetékes nemzeti közegészségügyi hatóságok előírásai szerint – szükség esetén az ilyen hatóságok speciális engedélyével – gyártanak és forgalmaznak, és a humán- vagy állatgyógyászatban megelőzésre, kezelésre vagy diagnosztizálásra vagy ezekkel kapcsolatos kutatásra, kísérleti vagy vizsgálati célokra szolgálnak. A teljesség igénye nélkül ide tartoznak a félkész vagy kész termékek, pl. a vakcinák.

*A tenyészet* olyan eljárás eredménye, amely által a kórokozókat szándékosan szaporítják. Ez a meghatározás nem terjed ki az e pontban meghatározott, betegtől származó mintára.

*A géntechnológiával módosított mikroorganizmusok és élő szervezetek* olyan mikroorganizmusok és élő szervezetek, amelyek genetikai anyagát szándékosan, génszűrés beavatkozással úgy változtatták meg, ami a természetben nem fordul elő.

*A gyógyászati vagy kórházi hulladékok* az állatok vagy emberek gyógykezeléséből vagy biológiai kísérletekből származó hulladékok.

*A betegtől származó minta* olyan, közvetlenül emberből vagy állatból levett anyag, beleértve többek között a váladékot, székletet, vért és alkotóelemeit, szövetmintákat, testnedveket, keneteket, valamint testrészeket, amelyet kutatás, vizsgálat, kórmeghatározás, gyógykezelés vagy kórmegelőzés céljából szállítanak.

*Besorolás*

**2.2.62.1.4** A fertőző anyagokat a 6.2 osztályba, az UN 2814, az UN 2900, az UN 3291, ill. az UN 3373 tételekhez kell besorolni.

A fertőző anyagok a következő kategóriákra vannak felosztva:

**2.2.62.1.4.1 „A” kategória:** Olyan fertőző anyag, amelyet olyan formában szállítanak, hogy kitétel esetén képes – egyébként egészséges – emberben vagy állatban tartós egészségkárosodást, életveszélyes vagy halálos megbetegedést okozni. Az e kritériumot kielégítő anyagokra\* tájékoztató példák találhatók az ebben a pontban levő táblázatban.

**Megjegyzés:** *Kitétel az, ha egy fertőző anyag a védőcsomagolásból kiszabadul és ennek eredményeként emberrel vagy állattal fizikai kapcsolatba kerül.*

- a) Azokat a fertőző anyagokat, amelyek ezeket a kritériumokat kielégítik és csak emberi, vagy emberi és állati megbetegedést okoznak, az UN 2814 tételhez kell besorolni. Azokat a fertőző anyagokat, amelyek csak állati megbetegedést okoznak, az UN 2900 tételhez kell besorolni;
- b) Az UN 2814, ill. az UN 2900 tételhez történő besorolást a páciens, ill. az állat ismert kórtörténetére, a helyi járvány körülményekre, a páciens, ill. az állat tüneteire vagy a páciens, ill. az állat egyedi körülményeinek szakszerű megítélésére kell alapozni.

**Megjegyzés: 1.** Az UN 2814 tétel esetében a helyes szállítási megnevezés „EMBEREKRE ÁRTALMAS FERTŐZŐ ANYAG”. Az UN 2900 tétel esetében a helyes szállítási megnevezés „csak ÁLLATOKRA ÁRTALMAS FERTŐZŐ ANYAG”.

**2.** A következő táblázat felsorolása nem teljes. Azokat a fertőző anyagokat, beleértve az új vagy kialakult patogéneket, amelyek nem szerepelnek a táblázatban, de ugyanazon kritériumoknak megfelelnek, szintén az „A” kategóriába kell besorolni. Ezenkívül, ha egy anyag esetében kétséges, hogy kielégíti-e a kritériumokat, akkor az „A” kategóriába kell besorolni.

**3** A következő táblázatban a dőlt betűvel szedett mikroorganizmusok baktériumok, mikoplazmák, rickettsiák vagy gombák.

Tájékoztató példák az „A” kategóriába tartozó anyagokra, amelyek minden formájukban ebbe a kategóriába tartoznak – kivéve, ha másként van jelölve (lásd 2.2.62.1.4.1)

UN szám és megnevezés	Mikroorganizmus
UN 2814 Emberekre ártalmas fertőző anyag	<i>Bacillus anthracis</i> (csak ha tenyészet) <i>Brucella abortus</i> (csak ha tenyészet) <i>Brucella melitensis</i> (csak ha tenyészet) <i>Brucella suis</i> (csak ha tenyészet) <i>Burkholderia mallei</i> - <i>Pseudomonas mallei</i> - takonykór (csak ha tenyészet)

(folyt.)	Sárgaláz vírus (csak ha tenyészet) <i>Yersinia pestis</i> (csak ha tenyészet)
UN 2900 Csak állatokra ártalmas fertőző anyag	Afrikai sertésláz vírus (csak ha tenyészet) Madár paramyxovírus 1 típus - velogén Newcastle-betegség (baromfipestis) vírus (csak ha tenyészet) Klasszikus sertésláz vírus (csak ha tenyészet) Száj- és körömfájás vírus (csak ha tenyészet) Lumpy skin disease vírus (csak ha tenyészet) <i>Mycoplasma mycoides</i> - fertőző szarvasmarha tüdő- és mellhártyagyulladás (csak ha tenyészet) Kis termetű kérődző pestis vírus (csak ha tenyészet) Marhavész vírus (csak ha tenyészet) Juhhimlő vírus (csak ha tenyészet) Kecskehimlő vírus (csak ha tenyészet) Sertés hólyaggyulladás vírus (csak ha tenyészet) Hólyagos szájgyulladás vírus (csak ha tenyészet)

a) A diagnosztikai és a klinikai célú tenyészeteket „B” kategóriájú fertőző anyagnak is be lehet sorolni.

**2.2.62.1.4.2 „B” kategória:** Olyan fertőző anyag, amely nem elégíti ki az „A” kategóriába történő besorolás kritériumait. A „B” kategóriába tartozó fertőző anyagokat az UN 3373 tételhez kell besorolni.

**Megjegyzés:** Az UN 3373 szám esetében a helyes szállítási megnevezés: „B” KATEGÓRIÁJÚ BIOLÓGIAI ANYAG.

**2.2.62.1.5 Kivételek**

**2.2.62.1.5.1** Azok az anyagok, amelyek nem tartalmaznak fertőző anyagokat, vagy amelyek nem valószínű, hogy emberi vagy állati megbetegedést okoznak, nem tartoznak a RID előírásainak hatálya alá, ha egyetlen más osztályba sorolás feltételeit sem elégítik ki.

**2.2.62.1.5.2** Az emberi vagy állati megbetegedést nem okozó mikroorganizmust tartalmazó anyagok nem tartoznak a RID előírásainak hatálya alá, ha egyetlen más osztályba sorolás feltételeit sem elégítik ki.

**2.2.62.1.5.3** Azok az anyagok, amelyekben a bennük lévő kórokozók olyan módon vannak semlegesítve vagy inaktíválva, hogy már nem jelentenek egészségi kockázatot, nem tartoznak a RID előírásainak hatálya alá, ha egyetlen más osztályba sorolás feltételeit sem elégítik ki.

**2.2.62.1.5.4** Azok az anyagok (ideértve az élelmiszer- és a vízmintákat is), amelyekben a kórokozók koncentrációja természetesen előforduló szinten van és a fertőzési kockázatuk nem tekinthető jelentősnek, nem tartoznak a RID előírásainak hatálya alá, ha egyetlen más osztályba sorolás feltételeit sem elégítik ki.

**2.2.62.1.5.5** A felszívóanyagra csöppentett, megszáradt vér, a belső vérzés megállapítására szolgáló székletminta, a vérátömlesztés céljából vagy szervátültetéshez, ill. vérátömlesztéshez használt vérkészítmények előállítás céljából gyűjtött vér és vér alkotórészek, valamint a szervátültetésre szolgáló szövetek és szervek nem tartoznak a RID előírásainak hatálya alá.

**2.2.62.1.5.6** Azok az emberi, ill. állati minták, amelyeknél elenyésző annak a valószínűsége, hogy

kórokozókat tartalmaznak, nem tartoznak a RID előírásainak hatálya alá, ha olyan csomagolásban szállítják, amely megakadályozza, hogy kiszivároghassanak, és az „**emberi minta, az ADR/RID egyéb előírásainak betartása nélkül szállítható**”, ill. „**állati minta, az ADR/RID egyéb előírásainak betartása nélkül szállítható**” felirattal meg vannak jelölve.

A csomagolás akkor elégíti ki az előző követelményt, ha megfelel a következőknek:

- a) A csomagolásnak három részből kell állnia:
  - i) szivárgásmentes elsődleges tartály(ok)ból;
  - ii) szivárgásmentes másodlagos csomagolásból; és
  - iii) olyan külső csomagolásból, amely úrtartalmának, tömegének és rendeltetésének megfelelően erős, és legalább egy oldalfelületének mérete legalább  $100\text{ mm} \times 100\text{ mm}$ ;
- b) Folyadékok esetén az elsődleges tartály(ok) és a másodlagos csomagolás közé az elsődleges tartály(ok) teljes tartalmának felszívására elegendő felszívóképes párnázóanyagot kell helyezni, hogy a folyékony anyag a szállítás során történő kiszabadulása vagy kiszivárgása esetén ne érhesse el a külső csomagolást, ill. ne okozza sem a párnázóanyag, sem a külső csomagolás sérülését;
- c) Amennyiben több törékeny elsődleges tartály van elhelyezve egyetlen másodlagos csomagolásban, úgy ezeket egyenként be kell burkolni vagy úgy kell elválasztani egymástól, hogy ne érintkezhessenek egymással.

**Megjegyzés:** 1. Annak eldöntését, hogy valamely anyag ezen alpont alapján kivételnek számít-e a páciens, ill. az állat ismert kórtörténetének, tüneteinek, egyedi körülményeinek és a helyi járvány körülményeknek a szakszerű megítélésére kell alapozni. Az ezen alpont szerint szállítható minta lehet pl.

- a koleszterinszint, vércukorszint, hormonszint, prosztatata specifikus antitestek (PSA) meghatározására szolgáló vér- és vizeletminta;
- a nemfertőző emberi vagy állati betegségekben a szív-, máj-, vesefunkció vagy terápiás célú gyógyszer szint meghatározásához szükséges minta;
- a biztosítás kötésnél vagy foglalkoztatáskor szükséges, kábítószer vagy alkohol kimutatására szolgáló minta
- a terhesség kimutatására szolgáló minta;
- a rák kimutatása céljából vett szövettani minta; és
- emberben vagy állatban lévő antitestek kimutatására szolgáló minta fertőzésre utaló gyanú nélkül (pl. oltóanyaggal létrehozott immunitás értékelése, autoimmun betegségek kórmeghatározása, stb).

2. Légi szállítás esetén az e pont szerint kivételnek számító minták csomagolóeszközeinek meg kell felelniük az a) – c) pontok feltételeinek.

2.2.62.1.6 –

2.2.62.1.8 (fenntartva)

2.2.62.1.9 Biológiai termékek

A RID alkalmazásában a biológiai termékek a következő csoportokra vannak osztva:

- a) olyan termékek, amelyeket az illetékes hatóságok követelményei szerint állítanak elő és csomagolnak be, és végső csomagolás (kiszerezés), illetve elosztás céljából szállítanak, hivatásos egészségügyi személyzet vagy magánszemély által történő egyéni gyógykezelés céljára. Az ebbe a csoportba tartozó anyagok nem tartoznak a RID előírásainak hatálya alá;

- b) olyan termékek, amelyek nem elégítik ki előző a) pont kritériumait, és amelyekről ismert vagy okkal feltételezhető, hogy fertőző anyagot tartalmaznak, és az „A” vagy a „B” kategóriába való feltételeknek megfelelnek. Az ebbe a csoportba tartozó anyagokat az UN 2814, az UN 2900, ill. az UN 3373 tételhez kell besorolni.

**Megjegyzés:** Egyes engedélyezett biológiai termékek csak a világ egyes részein képezhetnek biológiai veszélyt. Ilyen esetben az illetékes hatóság előírhatja, hogy ezek a biológiai termékek feleljenek meg a fertőző anyagokra vonatkozó követelményeknek vagy egyéb korlátozásokat foganatosíthat.

**2.2.62.1.10** Géntechnológiával módosított mikroorganizmusok és élő szervezetek

Azokat a géntechnológiával módosított mikroorganizmusokat, amelyek nem elégítik ki a fertőző anyagok meghatározását, a 2.2.9 szakasz szerint kell besorolni.

**2.2.62.1.11** Gyógyászati vagy kórházi hulladék

**2.2.62.1.11.1** Azokat a gyógyászati vagy kórházi hulladékokat, amelyek az „A” kategóriába tartozó fertőző anyagot tartalmaznak, az UN 2814, ill. az UN 2900 tételhez kell besorolni. Azokat a gyógyászati vagy kórházi hulladékokat, amelyek a „B” kategóriába tartozó fertőző anyagokat tartalmaznak, az UN 3291 tételhez kell besorolni.

**Megjegyzés:** Ezen előírások szerint kell besorolni a Bizottság 2000/532/EK<sup>6)</sup> módosított határozata mellékletét képező hulladékjegyzék szerinti 18 01 03 számú (Emberek, illetve állatok egészségügyi ellátásból és/vagy az azzal kapcsolatos kutatásból származó hulladékok – szülészeti, illetve az emberi betegségek diagnosztizálásából, kezeléséből, illetve megelőzéséből származó hulladékok – egyéb hulladékok, amelyek gyűjtése és ártalmatlanítása speciális követelményekhez kötött a fertőzések elkerülése érdekében) és a 18 02 02 számú (Emberek, illetve állatok egészségügyi ellátásból és/vagy az azzal kapcsolatos kutatásból származó hulladékok – állatbetegségek kutatásából, diagnosztizálásából, kezeléséből, illetve megelőzéséből származó hulladékok – egyéb hulladékok, amelyek gyűjtése és ártalmatlanítása speciális követelményekhez kötött a fertőzések elkerülése érdekében) gyógyászati vagy klinikai hulladékokat a páciens, ill. az állat orvosi, ill. állatorvosi diagnózis alapján.

**2.2.62.1.11.2** Azokat a gyógyászati vagy kórházi hulladékokat, amelyekről okkal feltételezhető, hogy csekély annak a valószínűsége, hogy fertőző anyag(ka)t tartalmaznak, az UN 3291 tételhez kell besorolni. A besoroláshoz a nemzetközi, regionális vagy belföldi hulladék jegyzékek is figyelembe vehetők.

**Megjegyzés:** 1. Az UN 3291 szám esetében a helyes szállítási megnevezés „NEM SPECIFIKÁLT KÓRHÁZI HULLADÉK M.N.N.” vagy „(BIO)GYÓGYÁSZATI HULLADÉK, M.N.N.” vagy „SZABÁLYOZOTT GYÓGYÁSZATI HULLADÉK, M.N.N.”

2. Az előző besorolási kritériumokkal ellentétben nem tartoznak a RID hatálya alá a Bizottság 2000/532/EK<sup>6)</sup> módosított határozata mellékletét képező hulladékjegyzék szerinti 18 01 04 számú (Emberek, illetve állatok egészségügyi ellátásból és/vagy az azzal kapcsolatos kutatásból származó

6) A Bizottság 2000/532/EK határozata (2000. május 3.) a hulladékjegyzéknek a hulladékokról szóló 75/442/EGK tanácsi irányelv [felváltotta a 2006/12/EK parlamenti és tanácsi irányelv (az EK Hivatalos Lapja L 114 szám, 2006. 04. 27., 9. oldal)] 1. cikkének a) pontja értelmében történő meghatározásáról szóló 94/3/EK határozat, valamint a veszélyes hulladékok jegyzékének a veszélyes hulladékokról szóló 91/689/EGK tanácsi irányelv 1. cikkének (4) bekezdése értelmében történő meghatározásáról szóló 94/904/EK tanácsi határozat felváltásáról (az EK Hivatalos Lapja, L 226 szám, 2000. 09. 06., 3. o.) Magyarországon lásd még a 16/2001. (VII. 18.) KőM rendeletet a hulladékok jegyzékéről.

*hulladékok – szülészeti, illetve az emberi betegségek diagnosztizálásából, kezeléséből, illetve megelőzéséből származó hulladékok – hulladékok, amelyek gyűjtése és ártalmatlanítása nem kötött speciális követelményekhez a fertőzések elkerülése érdekében) és a 18 02 03 számú (Emberek, illetve állatok egészségügyi ellátásból és/vagy az azzal kapcsolatos kutatásból származó hulladékok – állatbetegségek kutatásából, diagnosztizálásából, kezeléséből, illetve megelőzéséből származó hulladékok – hulladékok, amelyek gyűjtése és ártalmatlanítása nem kötött speciális követelményekhez a fertőzések elkerülése érdekében) gyógyászati vagy klinikai hulladékok.*

**2.2.62.1.11.3** Azok a fertőtlenített gyógyászati vagy kórházi hulladékok, amelyek korábban fertőző anyago(ka)t tartalmaztak, nem tartoznak a RID előírásainak hatálya alá, ha egyetlen más osztályba való besorolás kritériumát sem elérik ki.

**2.2.62.1.11.4** Az UN 3291 szám alá besorolt gyógyászati vagy kórházi hulladékok a II csomagolási csoporthoz vannak hozzárendelve.

**2.2.62.1.12** *Fertőzőtt állatok*

**2.2.62.1.12.1** Élő állatok fertőző anyag szállítására nem használhatók, kivéve, ha az anyag más módon nem szállítható. Azokat az élő állatokat, amelyeket szándékosan megfertőztek vagy amelyekről ismert vagy gyanítható, hogy fertőző anyagot tartalmaznak, csak az illetékes hatóság által előírt feltételek<sup>7)</sup> szerint lehet szállítani.

**2.2.62.1.12.2** Az „A” kategóriájú kórokozókkal, ill. a csak tenyészet esetén „A” kategóriába sorolandó kórokozókkal fertőzőtt állati eredetű anyagokat az UN 2814, ill. az UN 2900 tétel alá kell sorolni. A „B” kategóriájú kórokozókkal – kivéve azokat a kórokozókat, amelyek tenyészet esetén „A” kategóriába sorolandók – fertőzőtt állati eredetű anyagokat az UN 3373 tétel alá kell sorolni.

**2.2.62.2** *A fuvarozásból kizárt anyagok*

Gerinces vagy gerinctelen élő állatok fertőző anyagok szállítására nem használhatók, hacsak az anyag más módon nem szállítható, ill. a szállítást az illetékes hatóság jóvá nem hagyta (lásd a 2.2.62.1.12.1 pontot).

---

7) Az élő állatok szállítását szabályozó előírásokat tartalmaz pl. a 91/628/EGK irányelv az állatok szállítás közbeni védelméről (az EK Hivatalos Lapja L 340. szám, 1991. 12. 11., 17. old.) és az Európa Tanács (Miniszteri Bizottság) Ajánlásai egyes állatfajok szállítására. Magyarországon lásd még a 52/2003. (VIII. 15.) GKM-FVM együttes rendeletet.

**2.2.62.3 A gyűjtőmegnevezések felsorolása**

	Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
Fertőző anyagok			
Emberekre ártalmas anyagok	I1	2814	EMBEREKRE ÁRTALMAS FERTŐZŐ ANYAG
Csak állatokra ártalmas anyagok	I2	2900	csak ÁLLATOKRA ÁRTALMAS FERTŐZŐ ANYAG
Kórházi hulladék	I3	3291	NEM SPECIFIKÁLT KÓRHÁZI HULLADÉK, M.N.N. vagy
		3291	(BIO)GYÓGYÁSZATI HULLADÉK, M.N.N. vagy

Biológiai anyagok	I4	3373	„B” KATEGÓRIÁJÚ BIOLÓGIAI ANYAG

**2.2.7 7 osztály Radioaktív anyagok****2.2.7.1 Fogalommeghatározás**

**2.2.7.1.1 Radioaktív anyag** minden olyan anyag, amely radionuklidokat tartalmaz és mind az aktivitás koncentráció, mind a küldemény teljes aktivitása nagyobb, mint a 2.2.7.2.2.1 – 2.2.7.2.2.6 pontban meghatározott érték.

**2.2.7.1.2 Szennyezettség**

**Szennyezettségen** értendő valamely radioaktív anyag jelenléte egy felületen  $0,4 \text{ Bq/cm}^2$ -nél nagyobb mennyiségben béta-, gamma-sugárzók és csekély toxicitású alfa-sugárzók esetén, vagy  $0,04 \text{ Bq/cm}^2$ -nél nagyobb mennyiségben minden más alfa-sugárzó esetén.

**Nem tapadó szennyezettség** az olyan szennyezettség, amely rendes kezelési feltételek között a felületről eltávolítható.

**Tapadó szennyezettség** a nem tapadó szennyezettség kivételével minden más szennyezettség.

**2.2.7.1.3 Különleges fogalmak meghatározása** **$A_1$  és  $A_2$** 

**$A_1$ -en** a különleges formájú radioaktív anyagok azon aktivitása értendő, amely a 2.2.7.2.2.1 táblázatban fel van tüntetve vagy a 2.2.7.2.2.2 pont szerint van levezetve és a RID előírásaihoz az aktivitás határok megállapítására használatos.

**$A_2$ -n** a különleges formájú radioaktív anyagoktól eltérő, más radioaktív anyagok azon aktivitása értendő, amely a 2.2.7.2.2.1 táblázatban fel van tüntetve vagy a 2.2.7.2.2.2 pont szerint van levezetve, és a RID előírásaihoz az aktivitás határok megállapítására használatos.

A **besugárzatlan tórium** olyan tórium, amely 232-tórium grammonként legfeljebb  $10^{-7} \text{ g}$  233-uránt tartalmaz.

A **besugárzatlan urán** olyan urán, amely 235-urán grammonként legfeljebb  $2 \cdot 10^3 \text{ Bq}$  plutóniumot, 235-urán grammonként legfeljebb  $9 \cdot 10^6 \text{ Bq}$  hasadási terméket és 235-urán grammonként legfeljebb  $5 \cdot 10^{-3} \text{ g}$  236-uránt tartalmaz.

**Csekély toxicitású alfa-sugárzók:** természetes urán, szegényített urán, természetes tórium, 235-urán vagy 238-urán, 232-tórium, 228-tórium és 230-tórium, ha ezeket érczek vagy fizikai vagy kémiai koncentrátumok tartalmazzák; és a 10 napnál rövidebb felezési idejű alfa-sugárzók.

**Hasadóanyagok** a következők: 233-urán, 235-urán, 239-plutónium, 241-plutónium és ezen radionuklidok minden keveréke. Nem tartozik e meghatározás alá:

- a) a besugárzatlan természetes urán vagy szegényített urán, és
- b) az olyan természetes vagy szegényített urán, amit csak termikus reaktorokban sugároztak be.

**Kis fajlagos aktivitású (LSA) anyag:** Olyan radioaktív anyag, amelynek fajlagos aktivitása természeténél fogva korlátozott, vagy olyan radioaktív anyag, amelyre becsült közepes fajlagos aktivitás határérték vonatkozik. Az LSA anyagot körülvevő árnyékoló anyagot a becsült közepes fajlagos aktivitás meghatározásánál nem szabad figyelembe venni.

A **kis mértékben diszpergálódó radioaktív anyag** olyan szilárd radioaktív anyag vagy kapszulába zárt szilárd radioaktív anyag, amelynek diszpergálódási képessége korlátozott és nem por formájú.

**Különleges formájú (special form) radioaktív anyag:**

- a) szétterjedésre nem képes szilárd radioaktív anyagot; vagy
- b) radioaktív anyagot tartalmazó, tömören lezárt kapszulát jelent.

**Low specific activity (LSA):** lásd **kis fajlagos aktivitású (LSA) anyag**.

Egy **radionuklid fajlagos aktivitása** a nuklid egységnyi tömegére jutó aktivitás. Egy anyag fajlagos aktivitását úgy kell tekinteni, mint egy olyan anyagnak az egységnyi tömegére jutó aktivitását, amelyben a radionuklidok lényegében egyenletesen vannak elosztatva.

**Surface contaminated object (SCO):** lásd **szennyezett felületű tárgy (SCO)**.

**Szennyezett felületű tárgy (SCO):** A szennyezett felületű tárgy (SCO) olyan szilárd tárgy, amely önmagában nem radioaktív, de amelynek felületén radioaktív anyag van elosztatva (radioaktív anyaggal van szennyezve).

Az **urán (természetes, szegényített, dúsított)** a következőket jelenti:

A **természetes urán** olyan urán, amelyben az uránizotópok természetben előforduló eloszlásúak (kb. 99,28 tömeg% 238-urán és 0,72 tömeg% 235-urán). Ez lehet kémiaiilag elkülönített urán is.

A **szegényített urán** olyan urán, amelynek százalékos 235-urán tartalma kisebb, mint a természetes uráné.

A **dúsított urán** olyan urán, amelynek százalékos 235-urán tartalma nagyobb, mint 0,72%.

Mind a természetes, mind a dúsított, mind a szegényített uránban kis százalékban 234-urán is jelen van.

## 2.2.7.2 Besorolás

### 2.2.7.2.1 Általános előírások

**2.2.7.2.1.1** A radioaktív anyagokat a 2.2.7.2.2 – 2.2.7.2.5 pontok előírásai szerint, a küldeménydarabban lévő radionuklidok aktivitás szintje és hasadó, ill. nem hasadó volta, a szállítandó küldeménydarab típusa, a küldeménydarab tartalmának természete, ill. formája, valamint a szállításra vonatkozó külön megegyezés figyelembevételével kell a 2.2.7.2.1.1 táblázatban meghatározott valamely UN számhoz rendelni.

#### 2.2.7.2.1.1 táblázat – UN számhoz való hozzárendelés

UN 2978	RADIOAKTÍV ANYAG, URÁN-HEXAFLUORID, nem hasadó vagy hasadó-engedményes	

**2.2.7.2.2** *Az aktivitás szintek meghatározása***2.2.7.2.2.1** Az egyedi radionuklidokra a 2.2.7.2.2.1 táblázat a következő alapértékeket tartalmazza:

- a)  $A_1$  és  $A_2$  TBq-ben;
- b) mentességi aktivitás koncentráció az anyagra Bq/g-ban; és
- c) mentességi aktivitás határ a küldeményre Bq-ben.

**2.2.7.2.2.1 táblázat – Radionuklid alapértékek az egyes radionuklidokra**

- d) *Ezek az értékek csak olyan uránvegyületekre vonatkoznak, amelyek kémiai alakja normális szállítási körülmények között és baleset esetén is UF<sub>6</sub>, UO<sub>2</sub>F<sub>2</sub> vagy UO<sub>2</sub>(NO<sub>3</sub>)<sub>2</sub>.*
- e) *Ezek az értékek csak olyan uránvegyületekre vonatkoznak, amelyek kémiai alakja normális szállítási körülmények között és baleset esetén is UO<sub>3</sub>, UF<sub>4</sub>, UCl<sub>4</sub> vagy hatvegyértékű uránvegyület.*
- f) *Ezek az értékek az előző d) és e) pont alatt meghatározottakon kívüli egyéb más uránvegyületekre vonatkoznak.*
- g) *Ezek az értékek csak a besugárzatlan uránra vonatkoznak.*

**2.2.7.2.2.2** Azokra az egyedi radionuklidokra, amelyek nincsenek a 2.2.7.2.2.1 táblázatban felsorolva, a 2.2.7.2.2.1 pont szerinti radionuklid alapértékek meghatározásához többoldalú engedély szükséges. A Nemzetközi Sugárvédelmi Bizottság (ICRP) ajánlása szerint, a tüdőabszorpció típusnak megfelelő dózis tényezővel számított  $A_2$  érték használata is megengedett, ha mind a normális szállítási körülmények között, mind a baleset esetén lévő kémiai alakokat figyelembe veszik. Alternatívaként a 2.2.7.2.2.2 táblázatban található radionuklid alapértékek az illetékes hatóság engedélye nélkül használhatók.

**2.2.7.2.2.2 táblázat – Radionuklid alapértékek ismeretlen radionuklidokra vagy keverékekre**

Radioaktív tartalom	$A_1$ (TBq)	$A_2$ (TBq)	Mentességi aktivitás koncentráció anyagra (Bq/g)	Mentességi aktivitás küldeményre (Bq)
Csak béta- vagy gamma-sugarakat kibocsátó nuklidok jelenléte ismert	$1 \times 10^{-1}$	$2 \times 10^{-2}$	$1 \times 10^1$	$1 \times 10^4$
Alfa-sugarakat kibocsátó nuklidok jelenléte ismert, de neutron sugárzóké nem	$2 \times 10^{-1}$	$9 \times 10^{-5}$	$1 \times 10^{-1}$	$1 \times 10^3$
Neutron sugárzó nuklidok jelenléte ismert vagy nem áll tényleges adat rendelkezésre	$1 \times 10^{-3}$	$9 \times 10^{-5}$	$1 \times 10^{-1}$	$1 \times 10^3$

**2.2.7.2.2.3** A 2.2.7.2.2.1 táblázatban nem szereplő radionuklidokra az  $A_1$  és  $A_2$  számításakor az olyan radioaktív bomlási lánc, amelyben a radionuklidok a természetben előforduló arányban szerepelnek, és sem tíz napnál nagyobb, sem a kiindulási radionuklid felezési idejénél nagyobb felezési idejű leánynuklid nem szerepel, egy radionuklidnak tekintendő. Ekkor a figyelembe veendő aktivitás és az alkalmazandó  $A_1$  vagy  $A_2$  érték a kiindulási radionuklidra érvényes érték. Az olyan radioaktív bomlási láncban, amelyben a leánynuklidok felezési ideje nagyobb mint tíz nap, vagy nagyobb, mint a kiindulási radionuklid felezési ideje, a kiindulási nuklidot és az ilyen leánynuklidokat úgy kell kezelni, mint különböző nuklidok keverékét.

**2.2.7.2.2.4** Radionuklid keverékekre a 2.2.7.2.2.1 pont szerinti radionuklid alapértékek a következők szerint határozhatók meg:

$$X_m = \frac{1}{\sum_i \frac{f(i)}{X(i)}}, \text{ ahol}$$

$f(i)$  – a keverékben az  $i$ -edik radionuklid aktivitásának vagy aktivitás koncentrációjának részaránya;

$X(i)$  – az  $i$ -edik radionuklidra vonatkozó  $A_1$  vagy  $A_2$  érték, ill. az anyagra vonatkozó mentességi aktivitás koncentráció vagy a küldeményre vonatkozó mentességi aktivitás érték;

$X_m$  – keverék esetén a származtatott  $A_1$  vagy  $A_2$  érték, ill. az anyagra vonatkozó mentességi aktivitás koncentráció vagy a küldeményre vonatkozó mentességi aktivitás érték.

**2.2.7.2.2.5** Amennyiben minden egyes radionuklid azonossága ismert, azonban néhány radionuklid aktivitása ismeretlen, a radionuklidok csoportokba foglalhatók. Az egyes radionuklid csoportokra azután a 2.2.7.2.2.4 és a 2.2.7.2.4.4 pont szerinti képlet alkalmazása során a megfelelő legkisebb vonatkozó radionuklid értéket lehet alkalmazni. A csoportba sorolás alapja az összes alfa-aktivitás és az összes béta/gamma-aktivitás lehet, amennyiben ezek ismeretesek, amikor is az alfa-sugárzókra illetve béta/gamma-sugárzókra a legkisebb

radionuklid értéket kell alkalmazni.

**2.2.7.2.2.6** Azokra az egyedi radionuklidokra vagy radionuklid-keverékekre, amelyeknél tényleges adatok nem állnak rendelkezésre, a 2.2.7.2.2.2 táblázat értékeit kell alkalmazni.

**2.2.7.2.3** *Egyéb anyagjellemzők meghatározása*

**2.2.7.2.3.1** Kis fajlagos aktivitású (*LSA*) anyag

**2.2.7.2.3.1.1** (fenntartva)

**2.2.7.2.3.1.2** Az *LSA* anyagok az alábbi három csoport egyikéhez tartoznak:

a) *LSA-I*

- i) urán- és tóriumérccek és ezen érccek koncentrátumai és természetes radionuklidokat tartalmazó egyéb érccek, amelyeket ezen radionuklidok felhasználására kívánnak feldolgozni;
- ii) természetes urán vagy szegényített urán, vagy természetes tórium, vagy ezek vegyületei vagy keverékei, ha nincsenek besugározva és szilárdak vagy folyékonyak;
- iii) radioaktív anyagok, amelyek  $A_2$  értéke nincs korlátozva, kivéve a 2.2.7.2.3.5 pont szerint hasadónak besorolt anyagokat; vagy
- iv) egyéb radioaktív anyag, amelyben az aktivitás egyenletesen oszlik meg és a becsült közepes fajlagos aktivitás nem haladja meg a 2.2.7.2.2.1 – 2.2.7.2.2.6 pontban az aktivitás koncentrációra meghatározott érték 30-szorosát, kivéve a 2.2.7.2.3.5 pont szerint hasadónak besorolt anyagokat;

b) *LSA-II*

- i) a víz, legfeljebb 0,8 TBq/l trícium koncentrációval; vagy
- ii) egyéb anyagok, amelyekben az aktivitás egyenletesen oszlik meg, és amelyekben a becsült közepes fajlagos aktivitás szilárd anyagok és gázok esetében  $10^{-4}A_2/g$  értéket, folyadékok esetében a  $10^{-5}A_2/g$  értéket nem haladja meg;

c) *LSA-III*

Szilárd anyagok (pl. szilárdított hulladékok vagy felaktivált anyagok) a porok kivételével, amelyeknél

- i) a radioaktív anyagok szilárd anyagban vagy szilárd tárgyak együttesében vagy szilárd, tömör kötőanyagban (mint beton, bitumen, kerámia stb.) lényegében egyenletesen vannak eloszlva;
- ii) a radioaktív anyagok viszonylag oldhatatlanok, vagy azokat viszonylag oldhatatlan közeg tartalmazza úgy, hogy az egy küldeménydarabra jutó kilúgozódásból adódó radioaktív anyag veszteség a 7 napig tartó, vízben való áztatás során még a csomagolás elveszése esetén sem haladja meg a  $0,1A_2$  értéket; és
- iii) a szilárd anyagok becsült közepes fajlagos aktivitása az árnyékolóanyagok figyelembevétele nélkül a  $2 \cdot 10^{-3}A_2/g$  értéket nem haladja meg.

**2.2.7.2.3.1.3** Az *LSA-III* anyagnak olyan szilárd anyagnak kell lennie, hogy ha egy küldeménydarab teljes tartalmát alávetnék a 2.2.7.2.3.1.4 pont szerinti vizsgálatnak, a vízben mérhető aktivitás a  $0,1A_2$  értéket nem haladná meg.

**2.2.7.2.3.1.4** Az *LSA-III* anyagot a következők szerint kell vizsgálni:

A küldeménydarab teljes tartalmát reprezentáló szilárd anyag mintát hét napig környezeti hőmérsékletű vízbe kell meríteni. A vizsgálathoz használt víz mennyisége annyi legyen, hogy a hétnapos vizsgálati idő végén megmaradó el nem nyelt és hatástalan szabad vízmennyiség a szilárd vizsgálati minta térfogatának legkevesebb 10%-a legyen. A víz kezdeti pH-értéke 6...8 között kell legyen, miközben vezetőképessége 20 °C-on legfeljebb 1 mS/m lehet. A vizsgált minta 7 napig tartó bemerülését követően kell megmérni a szabad vízmennyiség teljes aktivitását.

**2.2.7.2.3.1.5** A 2.2.7.2.3.1.4 pontban meghatározott teljesítményszintnek való megfelelést a 6.4.12.1 és a 6.4.12.2 bekezdés szerint kell bizonyítani.

**2.2.7.2.3.2** Szennyezett felületű tárgyak (SCO)

A szennyezett felületű tárgyak (SCO) a következő két csoport egyikébe tartoznak:

- a) *SCO-I*: olyan szilárd tárgy, amelyen
  - i) a nem tapadó radioaktív szennyezettség aktivitása a hozzáférhető felületek 300 cm<sup>2</sup>-nyi részén (vagy a teljes felületen, ha az kisebb 300 cm<sup>2</sup>-nél) meghatározva, nem haladja meg a 4 Bq/cm<sup>2</sup> értéket béta- és gamma-sugárzók, valamint csekély toxicitású alfa-sugárzók esetén, ill. a 0,4 Bq/cm<sup>2</sup> értéket egyéb alfa-sugárzók esetén; és
  - ii) a tapadó radioaktív szennyezettség aktivitása a hozzáférhető felületek 300 cm<sup>2</sup>-nyi részén (vagy a teljes felületen, ha az kisebb 300 cm<sup>2</sup>-nél) meghatározva, nem haladja meg a 4·10<sup>4</sup> Bq/cm<sup>2</sup> értéket béta- és gamma-sugárzók, valamint csekély toxicitású alfa-sugárzók esetén, ill. a 4·10<sup>3</sup> Bq/cm<sup>2</sup> értéket egyéb alfa-sugárzók esetén; és
  - iii) a nem tapadó és a tapadó radioaktív szennyezettség aktivitásának összege a nem hozzáférhető felületek 300 cm<sup>2</sup>-nyi részén (vagy a teljes felületen, ha az kisebb 300 cm<sup>2</sup>-nél) meghatározva, nem haladja meg a 4·10<sup>4</sup> Bq/cm<sup>2</sup> értéket béta- és gamma-sugárzók, valamint csekély toxicitású alfa-sugárzók esetén, ill. a 4·10<sup>3</sup> Bq/cm<sup>2</sup> értéket egyéb alfa-sugárzók esetén.
- b) *SCO-II*: olyan szilárd tárgy, amelynek felületén olyan tapadó vagy nem tapadó radioaktív szennyezettség található, amely az a) pontban az *SCO-I*-re vonatkozó határokat meghaladja, és amelyen
  - i) a nem tapadó radioaktív szennyezettség aktivitása a hozzáférhető felületek 300 cm<sup>2</sup>-nyi részén (vagy a teljes felületen, ha az kisebb 300 cm<sup>2</sup>-nél) meghatározva, nem haladja meg a 400 Bq/cm<sup>2</sup> értéket béta- és gamma-sugárzók, valamint csekély toxicitású alfa-sugárzók esetén, ill. a 40 Bq/cm<sup>2</sup> értéket egyéb alfa-sugárzók esetén; és
  - ii) a tapadó radioaktív szennyezettség aktivitása a hozzáférhető felületek 300 cm<sup>2</sup>-nyi részén (vagy a teljes felületen, ha az kisebb 300 cm<sup>2</sup>-nél) meghatározva, nem haladja meg a 8·10<sup>5</sup> Bq/cm<sup>2</sup> értéket béta- és gamma-sugárzók, valamint csekély toxicitású alfa-sugárzók esetén, vagy a 8·10<sup>4</sup> Bq/cm<sup>2</sup> értéket egyéb alfa-sugárzók esetén; és
  - iii) a nem tapadó és a tapadó radioaktív szennyezettség aktivitásának összege a nem hozzáférhető felületek 300 cm<sup>2</sup>-nyi részén (vagy a teljes felületen, ha az kisebb 300 cm<sup>2</sup>-nél) meghatározva, nem haladja meg a 8·10<sup>5</sup> Bq/cm<sup>2</sup> értéket béta- és gamma-sugárzók, valamint csekély toxicitású alfa-sugárzók esetén, vagy a 8·10<sup>4</sup> Bq/cm<sup>2</sup> értéket egyéb alfa-sugárzók esetén.

**2.2.7.2.3.3** A különleges formájú radioaktív anyag

**2.2.7.2.3.3.1** A különleges formájú radioaktív anyag legalább egyik méretének el kell érnie az 5 mm-t. Ha egy tömören lezárt kapszula a különleges formájú radioaktív anyag részét képezi, azt úgy

kell kialakítani, hogy csak a kapszula szétroncsolásával lehessen kinyitni. A különleges formájú radioaktív anyag mintához egyoldalú engedély szükséges.

**2.2.7.2.3.3.2** A különleges formájú anyagnak olyan természetűnek vagy olyan szerkezetűnek kell lenni, hogy ha alávetnék a 2.2.7.2.3.3.4 – 2.2.7.2.3.3.8 pontban meghatározott vizsgálatoknak, kielégítené a következő előírásokat:

- a) nem szakad fel vagy nem törik össze a 2.2.7.2.3.3.5 a), b), c), és a 2.2.7.2.3.3.6 a) pontban ismertetett ejtési, ütési és hajlítási vizsgálat hatására (amelyik alkalmazható);
- b) nem olvad meg és nem diszpergálódik a 2.2.7.2.3.3.5 d) vagy a 2.2.7.2.3.3.6 b) pont szerinti hőpróba hatására (ha az alkalmazható); és
- c) a vízben mérhető aktivitás a 2.2.7.2.3.3.7 és a 2.2.7.2.3.3.8 pont szerinti kioldhatóság-vizsgálat során nem haladja meg a 2 kBq értéket; vagy helyette a zárt sugárforrásoknál az ISO 9978:1992 „Sugárzás elleni védelem – Zárt radioaktív sugárforrások – Zártságvizsgálati eljárások” szabvány alapján, a zártság mértékének megállapítására végzendő térfogati szivárgást meghatározó vizsgálat hatására nem lépi túl az elfogadott küszöböt, amely az illetékes hatóság számára elfogadható.

**2.2.7.2.3.3.3** A 2.2.7.2.3.3.2 pontban meghatározott teljesítményszintnek való megfelelést a 6.4.12.1 és a 6.4.12.2 bekezdés szerint kell bizonyítani.

**2.2.7.2.3.3.4** A különleges formájú radioaktív anyagból álló vagy azt modellező mintadarabokat a 2.2.7.2.3.3.5 pontban meghatározott ejtési, ütési, hajlítási és hőpróbának vagy a 2.2.7.2.3.3.6 pontban engedélyezett alternatív próbáknak kell kitenni. Minden vizsgálathoz használható másik mintadarab. Mindegyik vizsgálat után egy kioldhatóság- vagy térfogatvesztés-vizsgálatot kell végezni a mintán olyan eljárással, amely legalább olyan pontos, mint a nem diszpergálódó szilárd anyagra a 2.2.7.2.3.3.7 pontban megadott, ill. kapszulázott (tokozott) anyagra a 2.2.7.2.3.3.8 pontban megadott próbák.

**2.2.7.2.3.3.5** A megfelelő vizsgálati eljárások a következők:

- a) *Ejtési próba:* A mintát 9 m magasból ütközőlapra kell ejteni. Az ütközőlapnak a 6.4.14 szakaszban meghatározott kivitelűnek kell lennie.
- b) *Ütési próba:* A mintadarabot egy ólomlapra kell helyezni, amelyik sima, szilárd felületen nyugszik, és egy acélrúd lapos végével akkora ütést kell rá mérni, amely 1,4 kg tömeg 1 m magasból való függőleges ráejtésének felel meg. A rúd végének 25 mm átmérőjűnek kell lennie, a szélét  $3 \pm 0,3$  mm-es sugárral le kell kerekíteni. Az ólom 3,5...4,5 Vickers-keménységű és max. 25 mm vastagságú legyen; a felülete pedig nagyobb legyen, mint a próbatest által befedett felület. Minden ütéshez új ólomfelületet kell használni. A bélyeg (acélrúd) úgy üsse meg a mintát, hogy azon a legnagyobb sérülést okozza.
- c) *Hajlítási próba:* A próbát csak hosszú, vékony forrásokra kell alkalmazni, amelyeknek legkisebb hosszúsága 10 cm, és a hosszúságnak a legkisebb szélességhez viszonyított aránya legalább 10. A mintadarabot mereven, vízszintesen úgy kell befogni, hogy hosszúságának a fele nyúljon ki a befogásból. A mintadarabot úgy kell elhelyezni, hogy a mintadarab a legnagyobb sérülést szenvedje el, ha a szabad végét egy acélrúd lapos végével megütik. A rúdnak olyan erővel kell megütni a mintadarabot, hogy az egyenértékű legyen 1,4 kg tömeg 1 m-ről való függőleges ráejtésével. A rúd végének 25 mm átmérőjűnek kell lennie, a szélét  $3 \pm 0,3$  mm-es sugárral le kell kerekíteni.
- d) *Hőpróba:* A mintadarabot levegőn 800 °C-ra kell felhevíteni, és tíz percen át ezen a hőmérsékleten tartani, majd hagyni kell kihűlni.

**2.2.7.2.3.3.6** A zárt kapszulába tokozott radioaktív anyagból álló vagy azt modellező mintadarabokat a

következők alól lehet mentesíteni:

- a) a 2.2.7.2.3.3.5 a) és b) pontban leírt próbák alól, feltéve, hogy a különleges formájú radioaktív anyag tömege:
  - i) 200 g-nál kevesebb, és az ISO 2919:1999 „Sugárvédelem. Zárt radioaktív sugárforrások. Általános követelmények és osztályozás” szabványban meghatározott 4. osztályszámozású ütési próbát elvégezték; vagy
  - ii) 500 g-nál kevesebb, és az ISO 2919:1999 „Sugárvédelem. Zárt radioaktív sugárforrások. Általános követelmények és osztályozás” szabványban meghatározott 5. osztályszámozású ütési próbát elvégezték; és
- b) a 2.2.7.2.3.3.5 d) pontban leírt próba alól, feltéve, hogy helyette az ISO 2919:1999 „Sugárvédelem. Zárt radioaktív sugárforrások. Általános követelmények és osztályozás” szabványban meghatározott 6. osztályszámozású hőmérsékletpróbát elvégezték.

**2.2.7.2.3.3.7** A nem diszpergálódó, szilárd anyagokból álló vagy azt modellező mintadaraboknál kioldhatóság-vizsgálatot kell végezni a következők szerint:

- a) A mintadarabot hét napig környezeti hőmérsékletű vízbe kell meríteni. A vizsgálatához felhasznált víz mennyiségének elegendőnek kell lenni ahhoz, hogy a hétnapos vizsgálati idő végén megmaradó, el nem nyelt és hatástalan szabad vízmennyiség a szilárd vizsgálati minta térfogatának legkevesebb 10%-a legyen. A víz kezdeti pH-értéke 6...8 között legyen, miközben vezetőképessége 20 °C-on legfeljebb 1 mS/m lehet.
- b) A vizet a mintadarabbal együtt 50 °C ± 5 °C hőmérsékletre kell hevíteni, és négy órán át ezen a hőmérsékleten kell tartani.
- c) Ezután a víz aktivitását meg kell határozni.
- d) Ezt követően a mintadarabot legalább hét napon át legalább 90% relatív nedvességtartalmú és 30 °C-os mozdulatlan levegőn kell tárolni.
- e) Ezután a mintadarabot az a) pontban leírtakhoz hasonlóan vízbe kell meríteni, a vizet a mintadarabbal együtt ismét 50 °C ± 5 °C-ra fel kell melegíteni, és ezen a hőmérsékleten tartani négy órán át.
- f) Ezután a víz aktivitását meg kell határozni.

**2.2.7.2.3.3.8** A zárt kapszulába tokozott radioaktív anyagból álló vagy azt modellező mintadarabokon a minősítéshez vagy kioldhatóság- vagy térfogatvesztesség-vizsgálatot kell végezni a következők szerint:

- a) A kioldhatóság-vizsgálatnak a következő lépéseket kell tartalmazni:
  - i) A mintadarabot környezeti hőmérsékletű vízbe kell meríteni. A víz kezdeti pH-értéke 6-8 között legyen, miközben vezetőképessége 20 °C-on legfeljebb 1 mS/m lehet.
  - ii) A vizet a mintadarabbal együtt 50 °C ± 5 °C hőmérsékletre kell hevíteni, és négy órán át ezen a hőmérsékleten tartani.
  - iii) Ezután meg kell határozni a víz aktivitását.
  - iv) Ezt követően a mintadarabot legalább hét napon át legalább 90% relatív páratartalmú és 30 °C-os mozdulatlan levegőn kell tárolni.
  - v) Az i), ii), iii) alatti műveletet meg kell ismételni.
- b) A másik lehetőség szerinti térfogatvesztesség megállapításához az ISO 9978:1992 „Sugárzás elleni védelem – Zárt radioaktív sugárforrások – Zártságvizsgálati eljárások”

szabványban ismertetett azon próbákat kell alkalmazni, amelyek az illetékes hatóság számára elfogadhatók.

#### 2.2.7.2.3.4 Kis mértékben diszpergálódó radioaktív anyagok

**2.2.7.2.3.4.1** A kis mértékben diszpergálódó radioaktív anyag mintájához többoldalú engedély szükséges. A kis mértékben diszpergálódó radioaktív anyagnak olyannak kell lennie, hogy küldeménydarabban lévő összes radioaktív anyagra teljesüljenek a következő feltételek:

- a sugárzási szint a nem árnyékolt radioaktív anyagtól 3 m távolságban nem haladja meg a 10 mSv/h értéket;
- ha alávetnék a 6.4.20.3 és a 6.4.20.4 bekezdésben meghatározott próbáknak, a levegőbe történő gáz és legfeljebb 100 µm ekvivalens aerodinamikai átmérőjű részecske kibocsátás nem haladná meg a 100A<sub>2</sub> értéket. Mindegyik próbához külön mintadarabot lehet használni;
- ha alávetnék a 2.2.7.2.3.1.4 pontban meghatározott próbának, a vízben mérhető aktivitás nem haladná meg a 100A<sub>2</sub> értéket. A próba végrehajtásánál az előző b) pontban meghatározott próbák károsító hatását figyelembe kell venni.

**2.2.7.2.3.4.2** A kis mértékben diszpergálódó radioaktív anyagokat a következők szerint kell vizsgálni:

A kis mértékben diszpergálódó radioaktív anyagból álló vagy azt modellező mintadarabokat a 6.4.20.3 bekezdésben meghatározott fokozott hőpróbának és a 6.4.20.4 bekezdésben meghatározott ütépróbának kell alávetni. Mindegyik próbához külön mintadarabot lehet használni. A mintadarabot minden próba után alá kell vetni a 2.2.7.2.3.1.4. pont szerinti kioldhatóság-vizsgálatnak. Minden próba után meg kell vizsgálni, hogy a a 2.2.7.2.3.4.1 pont vonatkozó követelményei teljesülnek-e.

**2.2.7.2.3.4.3** A 2.2.7.2.3.4.1 és a 2.2.7.2.3.4.2 pontokban előírt követelményeknek való megfelelést a 6.4.12.1 és a 6.4.12.2 bekezdés szerint kell bizonyítani.

#### 2.2.7.2.3.5 Hasadóanyagok

A hasadó radionuklidot tartalmazó küldeménydarabot a 2.2.7.2.1.1 táblázat valamely hasadóanyag tételéhez kell sorolni, kivéve, ha a következő a) – d) alpontok valamelyikének megfelel. Küldeményenként csak egyfajta mentesítés engedélyezhető.

- a) A küldeményenkénti tömeghatár:

$$\frac{a \text{ 235 – urán tömege (g)}}{X} + \frac{az \text{ egyéb hasadóanyag tömege (g)}}{Y} < 1,$$

ahol X és Y a 2.2.7.2.3.5 táblázatban meghatározott tömeghatár, feltéve, hogy a küldeménydarabok legkisebb külső mérete legalább 10 cm, és amennyiben :

- vagy az egyes küldeménydarabok legfeljebb 15 g hasadóanyagot tartalmaznak; csomagolatlan anyagnál a mennyiségi korlát a kocsiban vagy a kocsin szállított küldeményre vonatkozik; vagy
- a hasadóanyag homogén hidrogéntartalmú oldat vagy keverék, amelyben a hasadó nuklid és a hidrogén aránya 5 tömeg%-nál kisebb; vagy
- az anyag bármely 10 liternyi térfogatában nincs 5 g-nál több hasadóanyag.

A hidrogénben természetes koncentrációban lévő deutériumot kivéve, sem berillium, sem deutérium nem lehet jelen a 2.2.7.2.3.5 táblázatban a küldeményre megadott tömeghatárok 1%-át meghaladó mennyiségben.

- b) Legfeljebb 1 tömeg% 235-urán tartalmú dúsított urán olyan összes plutónium- és 233-urán tartalommal, amely nem haladja meg a 235-urán tömegének 1%-át,

amennyiben a hasadóanyagok az anyagban lényegében egyenletesen vannak elosztatva. Ezenkívül a hasadóanyag a küldeménydarabon belül nem alkothat rácsszerű elrendeződést, ha a 235-urán mint fém, oxid vagy karbid van jelen.

- c) Uranil-nitrát folyékony oldata az urán tömegének legfeljebb 2%-át kitevő 235-urán dúsítással, olyan összes plutónium- és 233-urán tartalommal, amely a 235-urán tömegének 0,002%-át nem haladja meg; ezenkívül a nitrogén/urán atomarányának (N/U) legalább 2-nek kell lenni.
- d) Küldeménydarab, amely nem tartalmaz 1 kg-nál több plutóniumot, amely legfeljebb 20 tömeg% 239-plutóniumból, 241-plutóniumból vagy e két radionuklid bármilyen kombinációjából állhat.

**2.2.7.2.3.5 táblázat – Küldemény tömeghatárok a hasadóanyagot tartalmazó küldeménydarabokra vonatkozó előírások alóli mentességhez**

Hasadóanyag	A vízzel azonos vagy annál kisebb átlagos hidrogén-sűrűségű anyagokkal kevert hasadóanyag tömeg (g)	A víznél nagyobb átlagos hidrogén-sűrűségű anyagokkal kevert hasadóanyag tömeg (g)
235-urán (X)	400	290
Egyéb hasadóanyag (Y)	250	180

**2.2.7.2.4** *A küldeménydarabok és a csomagolatlan anyagok besorolása*

Egy küldeménydarab radioaktív anyag tartalma nem haladhatja meg a küldeménydarab típusra a következőkben meghatározott határértékeket.

**2.2.7.2.4.1** Engedményes küldeménydarabok besorolása

**2.2.7.2.4.1.1** Egy küldeménydarabot akkor lehet engedményes küldeménydarabnak besorolni, ha

- a) olyan üres csomagolóeszköz, amelyben radioaktív anyag volt;
- b) korlátozott mennyiségben tartalmaz készüléket vagy gyártmányt;
- c) természetes uránból, szegényített uránból vagy természetes tóriumból készült gyártmányt tartalmaz;
- d) korlátozott mennyiségű radioaktív anyagot tartalmaz.

**2.2.7.2.4.1.2** Egy radioaktív anyagot tartalmazó küldeménydarabot akkor lehet engedményes küldeménydarabnak besorolni, ha a sugárzási szint a külső felületének egyetlen pontján sem haladja meg az 5  $\mu\text{Sv/h}$  értéket.

**2.2.7.2.4.1.2 táblázat – Aktivitáshatárok engedményes küldeménydarabokra**

A tartalom halmazállapota	Készülékek és gyártmányok		Anyagok
	Határérték tárgyaként <sup>a)</sup>	Határérték küldeménydarabonként <sup>a)</sup>	Határérték küldeménydarabonként <sup>a)</sup>

a) A radionuklidokból álló keverékekre lásd a 2.2.7.2.2.4 – 2.2.7.2.2.6 pontot.

#### 2.2.7.2.4.1.3

Azokat a radioaktív anyagokat, amelyeket bizonyos készülék vagy bizonyos gyártmány tartalmaz vagy amelyek e tárgyak alkotórészét képezik, akkor lehet az UN 2911 RADIOAKTÍV ANYAG, ENGEDMÉNYES KÜLDEMÉNYDARABBAN – KÉSZÜLÉKEK vagy GYÁRTMÁNYOK tétel alá sorolni, ha:

- a sugárzási szint a csomagolatlan készülék vagy gyártmány bármely pontjától 10 cm távolságban nem haladja meg a 0,1 mSv/h értéket, és
- minden készülék vagy gyártmány el van látva a „RADIOACTIVE” felirattal, kivéve:
  - a radiolumineszcens világító kijelzőjű órákat és készülékeket;
  - azokat a fogyasztási cikkeket, amelyek vagy a 1.7.1.4 d) pont szerinti hatósági engedéllyel rendelkeznek, vagy amelyek aktivitása egyedileg nem haladja meg a 2.2.7.2.2.1 táblázatban a küldeményre vonatkozó mentességi aktivitás határát (5. oszlop), amennyiben az ilyen cikkeket olyan küldeménydarabban szállítják, amelynek valamely belső felülete el van látva a „RADIOACTIVE” felirattal úgy, hogy a küldeménydarab felnyitásakor a radioaktív anyag jelenlétére utaló figyelmeztetés láthatóvá válik; és
- az aktív anyagot a nem aktív komponensek teljesen bezárják (az olyan eszköz, amelynek kizárólagos funkciója a radioaktív anyag megtartása, nem tekinthető készüléknek vagy gyártmánynak); és
- a 2.2.7.2.4.1.2 táblázatnak a 2, ill. 3 oszlopában feltüntetett határértékek minden egyes tárgyra és minden egyes küldeménydarabra teljesülnek.

#### 2.2.7.2.4.1.4

Azokat a radioaktív anyagokat, amelyek aktivitása nem haladja meg a 2.2.7.2.4.1.2 táblázatnak a 4 oszlopában feltüntetett határértéket, akkor lehet az UN 2910 RADIOAKTÍV ANYAG, ENGEDMÉNYES KÜLDEMÉNYDARABBAN – KORLÁTOZOTT ANYAG-MENNYISÉG tétel alá sorolni, ha:

- a küldeménydarab azon feltételek között, amelyek a normális szállítás során valószínűleg fennállnak, a tartalmat megtartja, és
- a küldeménydarab valamely belső felülete el van látva a „RADIOACTIVE” felirattal, úgy, hogy a küldeménydarab felnyitásakor a radioaktív anyag jelenlétére utaló figyelmeztetés láthatóvá válik.

#### 2.2.7.2.4.1.5

Valamely üres csomagolóeszközt, amely előzőleg radioaktív anyagot tartalmazott, és amelynek aktivitása nem haladja meg a 2.2.7.2.4.1.2 táblázatnak a 4 oszlopában feltüntetett határértéket, akkor lehet az UN 2908 RADIOAKTÍV ANYAG, ENGEDMÉNYES KÜLDEMÉNYDARABBAN – ÜRES CSOMAGOLÓESZKÖZ tétel alá sorolni, ha:

- jól karbantartott és biztonságosan zárva van;
- a szerkezetében levő urán vagy tórium külső felülete fémből vagy más szilárd anyagból álló inaktív burkolattal van ellátva;

- c) a belső, nem tapadó szennyezettség szintje a felület bármely 300 cm<sup>2</sup>-nyi részén képzett átlagra nem haladja meg
  - i) a 400 Bq/cm<sup>2</sup>-t béta-, gamma -, valamint csekély toxicitású alfa-sugárzók esetén; ill.
  - ii) a 40 Bq/cm<sup>2</sup>-t minden más alfa-sugárzó esetén, és
- d) az 5.2.2.1.11.1 pont szerint elhelyezett esetleges bárcák nem láthatóak.

**2.2.7.2.4.1.6** Az olyan gyártmányt, amelyben az egyetlen radioaktív anyag besugárzatlan természetes urán, besugárzatlan szegényített urán vagy besugárzatlan természetes tórium, akkor lehet az UN 2909 RADIOAKTÍV ANYAG, ENGEDMÉNYES KÜLDEMÉNYDARABBAN – TERMÉSZETES URÁNBÓL vagy SZEGÉNYÍTETT URÁNBÓL vagy TERMÉSZETES TÓRIUMBÓL KÉSZÜLT GYÁRTMÁNYOK tétel alá sorolni, ha az urán vagy a tórium külső felülete fémből vagy más szilárd anyagból álló inaktív burkolattal van ellátva.

**2.2.7.2.4.2** Kis fajlagos aktivitású (*LSA*) anyagok besorolása

Egy radioaktív anyag csak akkor sorolható be *LSA* anyagként, ha a 2.2.7.2.3.1 pont és a 4.1.9.2 bekezdés feltételei teljesülnek.

**2.2.7.2.4.3** Szennyezett felületű (*SCO*) tárgyak besorolása

Egy radioaktív anyag csak akkor sorolható be *SCO* tárgyként, ha a 2.2.7.2.3.2 pont és a 4.1.9.2 bekezdés feltételei teljesülnek.

**2.2.7.2.4.4** A típusú küldeménydarabok besorolása

Radioaktív anyagot tartalmazó küldeménydarabok akkor sorolhatók be *A* típusú küldeménydarabként, ha a következő feltételek teljesülnek:

Az *A* típusú küldeménydarabok nem tartalmazhatnak nagyobb aktivitást, mint a következő:

- a) különleges formájú radioaktív anyagból:  $A_1$ , ill.
- b) minden más radioaktív anyagból:  $A_2$ .

Azoknál a radionuklid-keverékeknél, amelyeknél minden egyes radionuklid azonossága és aktivitása ismert, a következő feltételeket kell alkalmazni az *A* típusú küldeménydarabok radioaktív tartalmára:

$$\sum_i \frac{B(i)}{A_1(i)} + \sum_j \frac{C(j)}{A_2(j)} \leq 1, \text{ ahol}$$

$B(i)$  a különleges formájú radioaktív anyagként jelen levő  $i$ -edik radionuklid aktivitása;

$A_1(i)$  az  $i$ -edik radionuklid  $A_1$  értéke;

$C(j)$  a nem különleges formájú radioaktív anyagként jelen levő  $j$ -edik radionuklid aktivitása; és

$A_2(j)$  a  $j$ -edik radionuklid  $A_2$  értéke.

**2.2.7.2.4.5** Urán-hexafluorid besorolása

Az urán-hexafluoridot csak az UN 2977 RADIOAKTÍV ANYAG, HASADÓ URÁN-HEXAFLUORID vagy az UN 2978 RADIOAKTÍV ANYAG, URÁN-HEXAFLUORID, nem hasadó vagy hasadó-engedményes tétel alá lehet sorolni.

**2.2.7.2.4.5.1** Az urán-hexafluoridot tartalmazó küldeménydarabok:

- a) nem tartalmazhatnak a küldeménydarab-mintára engedélyezettnél nagyobb tömegű urán-hexafluoridot;
- b) nem tartalmazhatnak annál nagyobb tömegű urán-hexafluoridot, mint ami 5%-nál kisebb üres teret eredményezne a küldeménydarabban azon a legnagyobb hőmérsékleten, amely arra az üzemi létesítményre van meghatározva, ahol a küldeménydarabot használni fogják; ill.
- c) csak szilárd urán-hexafluoridot tartalmazhatnak, és a szállításra való átadásakor a küldeménydarab belső nyomása nem lehet nagyobb az atmoszferikus nyomásnál.

**2.2.7.2.4.6**  $B(U)$ ,  $B(M)$  és  $C$  típusú küldeménydarabok besorolása**2.2.7.2.4.6.1** A 2.2.7.2.4 pont (2.2.7.2.4.1 – 2.2.7.2.4.5 alpontok) szerint máshová nem sorolt küldeménydarabokat a származási ország illetékes hatósága által kiadott küldeménydarab-minta engedélynek megfelelően kell besorolni.**2.2.7.2.4.6.2** Egy küldeménydarab csak akkor sorolható be  $B(U)$  típusú küldeménydarabként, ha nem tartalmaz:

- a) nagyobb aktivitást, mint a küldeménydarab-mintára engedélyezett;
- b) más radionuklidokat, mint a küldeménydarab-mintára engedélyezett; vagy
- c) olyan anyagokat, amelyek alakjukban, fizikai vagy kémiai állapotukban a küldeménydarab-minta engedélyezett tartalmától eltérnek,

amint a küldeménydarab-minta engedélyben meg van határozva.

**2.2.7.2.4.6.3** Egy küldeménydarab csak akkor sorolható be  $B(M)$  típusú küldeménydarabként, ha nem tartalmaz:

- a) nagyobb aktivitást, mint a küldeménydarab-mintára engedélyezett;
- b) más radionuklidokat, mint a küldeménydarab-mintára engedélyezett; vagy
- c) olyan anyagokat, amelyek alakjukban, fizikai vagy kémiai állapotukban a küldeménydarab-minta engedélyezett tartalmától eltérnek,

amint a küldeménydarab-minta engedélyben meg van határozva.

**2.2.7.2.4.6.4** Egy küldeménydarab csak akkor sorolható be  $C$  típusú küldeménydarabként, ha nem tartalmaz

- a) nagyobb aktivitást, mint a küldeménydarab-mintára engedélyezett;
- b) más radionuklidokat, mint a küldeménydarab-mintára engedélyezett; vagy
- c) olyan anyagokat, amelyek alakjukban, fizikai vagy kémiai állapotukban a küldeménydarab-minta engedélyezett tartalmától eltérnek,

amint a küldeménydarab-minta engedélyben meg van határozva.

**2.2.7.2.5** *Külön megegyezés*

Egy radioaktív anyag akkor sorolható be külön megegyezés alapján szállított anyagként, ha az 1.7.4 szakasz szerint kívánják szállítani.

**2.2.8            8 osztály            Maró anyagok****2.2.8.1            *Kritériumok***

**2.2.8.1.1**        A 8 osztály fogalmkörébe azok az anyagok tartoznak, amelyek vegyi reakciójukkal a velük érintkezésbe kerülő hámszövetet – a bőr hámrétegét vagy a nyálkahártyát – megtámadják, vagy elfolyás esetén képesek megrongálni vagy tönkretenni más árukat vagy a szállítóeszközöket. Ugyancsak ezen osztály fogalmkörébe tartoznak azok az anyagok, amelyek csak víz jelenlétében képeznek maró anyagot, vagy amelyek a levegő természetes nedvességének jelenlétében maró gőzöket vagy ködöket fejlesztenek.

**2.2.8.1.2**        A 8 osztály anyagai és tárgyai a következők szerint vannak csoportosítva:

C1 – C10            Maró anyagok járulékos veszély nélkül

          C1 – C4        Savas anyagok:

                  C1        Szervetlen, folyékony anyagok

                  C2        Szervetlen, szilárd anyagok

                  C3        Szerves, folyékony anyagok

                  C4        Szerves, szilárd anyagok

          C5 – C8        Bázikus jellegű anyagok:

                  C5        Szervetlen, folyékony anyagok

                  C6        Szervetlen, szilárd anyagok

                  C7        Szerves, folyékony anyagok

                  C8        Szerves, szilárd anyagok

          C9 – C10        Egyéb maró anyagok:

                  C9        Folyékony anyagok

                  C10        Szilárd anyagok

                  C11        Tárgyak

CF        Maró, gyúlékony anyagok:

          CF1        Folyékony anyagok

          CF2        Szilárd anyagok

CS        Maró, önmelegedő anyagok:

          CS1        Folyékony anyagok

          CS2        Szilárd anyagok

CW        Maró, vízzel érintkezve gyúlékony gázokat fejlesztő anyagok:

          CW1        Folyékony anyagok

          CW2        Szilárd anyagok

CO        Maró, gyújtó hatású anyagok:

          CO1        Folyékony anyagok

          CO2        Szilárd anyagok

CT Maró, mérgező anyagok:

CT1 Folyékony anyagok

CT2 Szilárd anyagok

CFT Maró, gyúlékony, mérgező, folyékony anyagok

COT Maró, gyújtó hatású, mérgező anyagok.

*Besorolás és a csomagolási csoportokhoz való hozzárendelés*

**2.2.8.1.3** A 8 osztály anyagait a szállítás során általuk képviselt veszély mértéke szerint a következő három csomagolási csoport valamelyikéhez kell hozzárendelni:

I csomagolási csoport: erősen maró anyagok

II csomagolási csoport: maró anyagok

III csomagolási csoport: gyengén maró anyagok.

**2.2.8.1.4** A 8 osztályba sorolt anyagokat és tárgyakat a 3.2 fejezet „A” táblázata sorolja fel. Az anyagok hozzárendelése az I, a II és a III csomagolási csoporthoz tapasztalati alapon történt, figyelembe véve olyan kiegészítő tényezőket is, mint a belélegzési veszély (lásd 2.2.8.1.5) és a vízzel való reakció (beleértve a veszélyes bomlástermékek képződését).

**2.2.8.1.5** Azokat az anyagokat és készítményeket, amelyek kielégítik a 8 osztály feltételeit és az I csomagolási csoportnak megfelelő por és köd belélegzési mérgezőképességgel ( $LC_{50}$ ) rendelkeznek, de a lenyelés vagy bőrön át való felszívódás esetén a mérgezőképességük a III csomagolási csoportnak megfelelő vagy annál kevésbé mérgezőek, a 8 osztályba kell sorolni.

**2.2.8.1.6** A 3.2 fejezet „A” táblázatában név szerint nem említett anyagok, beleértve a keverékeket is, a 2.2.8.3 bekezdés megfelelő tétele alá és a megfelelő csomagolási csoporthoz a következő a) – c) pont kritériumai szerint, azon érintkezési időtartam alapján sorolhatók be, amely alatt az emberi bőr roncsolódása annak teljes vastagságában bekövetkezik.

A folyékony anyagoknál, ill. azoknál a szilárd anyagoknál, amelyek a szállítás alatt folyékonná válhatnak, ha feltételezhető, hogy nem okoznak az emberi bőrön, annak teljes vastagságában roncsolódást, figyelembe kell venni a fémfelületekre gyakorolt korróziós hatás lehetőségét. A csomagolási csoportba sorolás során figyelembe kell venni az emberen bekövetkezett balesetknél szerzett tapasztalatokat. Az emberen szerzett tapasztalatok hiányában a csomagolási csoportba sorolást kísérletek adatai alapján kell végezni, összhangban az OECD 404 Útmutatóval<sup>8)</sup>.

- a) azok az anyagok, amelyek a sértetlen bőrszövet teljes vastagságban bekövetkező roncsolódását okozzák legfeljebb 3 percig tartó érintkezés után 60 perces megfigyelési időtartamon belül, az I csomagolási csoport anyagai;
- b) azok az anyagok, amelyek a sértetlen bőrszövet teljes vastagságban bekövetkező roncsolódását okozzák 3 percnél hosszabb ideig, de legfeljebb 60 percig tartó érintkezés után 14 napos megfigyelési időtartamon belül, a II csomagolási csoport anyagai;
- c) a következő anyagok a III csomagolási csoport anyagai:
  - azok az anyagok, amelyek a sértetlen bőrszövet teljes vastagságban bekövetkező roncsolódását okozzák 60 percnél hosszabb ideig, de legfeljebb 4 óráig tartó érintkezés után 14 napos megfigyelési időtartamon belül; vagy
  - azok az anyagok, amelyek nem okozzák a sértetlen bőrszövet teljes vastagságban

8) OECD Útmutató vegyszerek vizsgálatára, No. 404 „Akut bőrirritáció/maró hatás”, 1992.

bekövetkező roncsolódását, de a korróziósebesség – ha mindkét fémen vizsgálják – akár az acél, akár az alumínium felületen 55 °C vizsgálati hőmérsékleten meghaladja az évi 6,25 mm-t. Az acélon végzett vizsgálathoz S235JR+CR (1.0037, ill. St 37-2), S275J2G3+CR (1.0144, ill. St 44-3), ISO 3574, Unified Numbering System (UNS) G10200 vagy SAE 1020 minőségű acélt, az alumíniumon végzetthez nem eloxált 7075-T6 vagy AZ5GU-T6 minőségű alumíniumot kell használni. Elfogadott vizsgálat található a „Vizsgálatok és kritériumok kézikönyv”, III. rész 37. fejezetében.

**Megjegyzés:** *Ha az első vizsgálat (akár acélon, akár alumíniumon végzik) azt mutatja, hogy a vizsgált anyag korróziós hatású, a második vizsgálatot a másik fémen nem szükséges végrehajtani.*

- 2.2.8.1.7** Ha a 8 osztály anyagai valamilyen anyag hozzáadása révén eltérő veszélyességi kategóriába kerülnek át, mint ahová a 3.2 fejezet „A” táblázatában név szerint említett anyagok tartoznak, ezeket a keverékeket azok alá a tételek alá kell besorolni, amelyekbe tényleges veszélyességük mértéke alapján tartoznak.

**Megjegyzés:** *Az oldatok és keverékek (készítmények és hulladékok) besorolására lásd még a 2.1.3 szakaszt.*

- 2.2.8.1.8** A 2.2.8.1.6 pontban található kritériumok alapján az is meghatározható, hogy egy név szerint feltüntetett vagy egy név szerint feltüntetett anyagot tartalmazó oldat vagy keverék természete olyan, az anyag nem esik ezen osztály előírásainak hatálya alá.

- 2.2.8.1.9** Azok az anyagok, oldatok és keverékek, amelyek
- a módosított 67/548/EGK<sup>9)</sup> vagy az 1999/45/EK<sup>10)</sup> Irányelv kritériumai alapján, ezen irányelvek szerint nem számítanak marónak, és
  - nem mutatnak maró hatást az acélon és az alumíniumon

a 8 osztályba nem tartozó anyagoknak tekinthetők.

**Megjegyzés:** *Az ENSZ Minta Szabályzatban felsorolt UN 1910 kalcium-oxid és UN 2812 nátrium-aluminát nem tartozik a RID előírásainak hatálya alá.*

## **2.2.8.2 A fuvarozásból kizárt anyagok**

- 2.2.8.2.1** A 8 osztály vegyileg nem állandó anyagai csak akkor adhatók át szállításra, ha megtették a szükséges intézkedéseket, hogy megakadályozzák a szállítás alatti veszélyes bomlásukat vagy polimerizációjukat. Ennek elérésére különösen azt kell biztosítani, hogy a tartályok, ill. tartányok ne tartalmazzanak olyan anyago(ka)t, amelyek ilyen reakciókat okozhatnak.

- 2.2.8.2.2** A következő anyagok a fuvarozásból ki vannak zárva:
- UN 1798 királyvíz (salétromsav és sósav keveréke);
  - a vegyileg nem állandó, kimerült kénsavkeverékek;
  - a nem denitrált, vegyileg nem állandó nitrálsav keverékek és az elhasznált kénsav és salétromsav keverékek;

9) Az Európai Közösségek Tanácsának 1967. június 27-i 67/548/EGK Irányelve a tagállamok veszélyes anyagok osztályozására, csomagolására és címkézésére vonatkozó jogszabályainak és közigazgatási előírásainak közelítéséről (Az EK Hivatalos Lapja, L 196. szám, 1967.08.16.).

10) Az Európai Parlament és a Tanács 1999. május 31-i 1999/45/EK Irányelve a tagállamok veszélyes készítmények osztályozására, csomagolására és címkézésére vonatkozó jogszabályainak és közigazgatási előírásainak közelítéséről (lásd az EK Hivatalos Lapja, L 200. szám, 1999.07.30., p. 1-68.).

- perklórsav vizes oldata 72 tömeg%-nál több tiszta savtartalommal és a perklórsav keverékei vízén kívül más folyadékkal.

A következő anyag a vasúti fuvarozásból ki van zárva:

- kén-trioxid, legalább 99,95% tisztaságú, nem stabilizált (inhibitor nélkül).

## 2.2.8.3 A gyűjtőmegnevezések felsorolása

Járolékos veszély	Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
Maró anyagok járulékos veszély nélkül			
Savas anyagok	szervetlen	folyékony C1	2584 FOLYÉKONY ALKIL-SZULFONSAVAK 5%-nál több szabad kénsav-tartalommal vagy 2584 FOLYÉKONY ARIL-SZULFONSAVAK 5%-nál több szabad kénsav-tartalommal 2837 BISZULFÁTOK VIZES OLDATAI 2693 BISZULFITOK, VIZES OLDAT, M.N.N. 3264 MARÓ, FOLYÉKONY, SAVAS SZERVETLEN ANYAG, M.N.N.

<b>Gyújtó hatású, mérgező anyagok<sup>d,e)</sup></b>		<b>COT</b>	(Ilyen osztályozási kóddal nincs gyűjtőmegnevezés. Ha szükséges, a 2.1.3.10 bekezdés veszélyességi rangsor táblázata alapján meghatározandó, másik osztályozási kód valamely gyűjtőmegnevezése alá kell sorolni.)

#### Megjegyzés:

- A RID előírásainak hatálya alá nem tartozó szilárd anyagok és maró folyadékok keverékei az UN 3244 azonosító szám alatt szállíthatók anélkül, hogy a 8 osztály besorolási feltételeit alkalmazni kellene, amennyiben az anyag berakása során, ill. a csomagolóeszköz, a konténer vagy a kocsi lezárásakor szabad folyadék szemmel nem látható. Minden egyes csomagolóeszköznek olyan gyártási típusnak kell megfelelni, ami sikeresen kiállta a II csomagolási csoportra előírt tömörségi próbát.
- Azok a klór-szilánok, amelyek vízzel vagy nedves levegővel érintkezve gyúlékony gázokat fejlesztenek, a 4.3 osztály anyagai.
- A túlnyomórészt mérgező tulajdonságokkal bíró klór-formiátok a 6.1 osztály anyagai.
- Azok a maró anyagok, amelyek a 2.2.61.1.4 – 2.2.61.1.9 pont szerint belégzésre nagyon mérgezők, a 6.1 osztály anyagai.
- az UN 2505 ammónium-fluorid, az UN 1812 szilárd kálium-fluorid, az UN 1690 szilárd nátrium-fluorid, az UN 2674 nátrium-fluorid-szilikát, az UN 2856 fluoroszilikátok, m.n.n., az UN 3415 nátrium-fluorid oldat és az UN 3422 kálium-fluorid oldat a 6.1 osztály anyagai.

**2.2.9            9 osztály            Különféle veszélyes anyagok és tárgyak****2.2.9.1            *Kritériumok***

**2.2.9.1.1**            A 9 osztály címének fogalmkörébe azok az anyagok és tárgyak tartoznak, amelyek a szállítás során olyan veszélyt képviselnek, ami nem esik a többi osztály fogalmkörébe.

**2.2.9.1.2**            A 9 osztály anyagai és tárgyai a következők szerint vannak csoportosítva:

M1    Anyagok, amelyek finom poruk belélegzése esetén az egészséget veszélyeztethetik

M2    Anyagok és készülékek, amelyekből tűz esetén dioxinok képződhetnek

M3    Gyúlékony gőzöket fejlesztő anyagok

M4    Lítium akkumulátorok

M5    Biztonsági felszerelések

M6 – M8    Környezetre veszélyes anyagok:

        M6    Vízi környezetre veszélyes, folyékony anyagok

        M7    Vízi környezetre veszélyes, szilárd anyagok

        M8    Géntechnológiával módosított mikroorganizmusok és élő szervezetek

M9 – M10    Magas hőmérsékletű anyagok:

        M9    Folyékony anyagok

        M10   Szilárd anyagok

M11   Egyéb anyagok, amelyek a szállítás alatt veszélyt jelentenek, de egyetlen más osztály meghatározásának sem felelnek meg.

*Fogalommeghatározások és besorolás*

**2.2.9.1.3**            A 9 osztályba sorolt anyagokat a 3.2 fejezet „A” táblázata sorolja fel. A 3.2 fejezet „A” táblázatában név szerint nem említett anyagok és tárgyak besorolását ezen táblázat, ill. a 2.2.9.3 bekezdés megfelelő tétele alá 2.2.9.1.4 – 2.2.9.1.14 pont szerint kell végezni.

*Anyagok, amelyek finom poruk belélegzése esetén az egészséget veszélyeztethetik*

**2.2.9.1.4**            Azon anyagok közé, amelyek finom poruk belélegzése esetén az egészséget veszélyeztethetik, az azbeszt és az azbesztet tartalmazó keverékek tartoznak.

*Anyagok és készülékek, amelyekből tűz esetén dioxinok képződhetnek*

**2.2.9.1.5**            Azon anyagok és készülékek közé, amelyekből tűz esetén dioxinok képződhetnek, a poliklórozott és polihalogénezett bifenilek és terfenilek (PCB-k és PCT-k), valamint az ezeket az anyagokat tartalmazó keverékek, továbbá az ilyen anyagokat vagy keverékeket tartalmazó készülékek, mint pl. transzformátorok, kondenzátorok tartoznak.

**Megjegyzés:** Az olyan keverékek, amelyek PCB- vagy PCT-tartalma nem haladja meg az 50 mg/kg értéket, nem tartoznak a RID előírásainak hatálya alá.

*Gyúlékony gőzöket fejlesztő anyagok*

- 2.2.9.1.6** A gyúlékony gőzöket fejlesztő anyagok közé tartoznak azok a polimerek, amelyek legfeljebb 55 °C lobbaspontú gyúlékony folyadékot tartalmaznak.

*Lítium akkumulátorok*

- 2.2.9.1.7** A „lítium akkumulátorok” fogalom azokra a cellákra és akkumulátorokra terjed ki, amelyek bármilyen formában lítiumot tartalmaznak. Ezek akkor sorolhatók a 9 osztályba, ha kielégítik a 3.3 fejezet 230 különleges előírását. Ha kielégítik 3.3 fejezet 188 különleges előírását, nem tartoznak a RID előírásainak hatálya alá. A besorolást a „Vizsgálatok és kritériumok kézikönyv” 38.3 bekezdésének előírásai szerint kell végezni.

*Biztonsági felszerelések*

- 2.2.9.1.8** A biztonsági felszerelések közé tartoznak azok a mentőeszközök és gépjármű tartozékok, amelyek megfelelnek a 3.3 fejezet 235, ill. 296 különleges előírásában szereplő leírásnak.

*Környezetre veszélyes anyagok*

- 2.2.9.1.9** (törölve)

*Vízi környezetet szennyező anyagok*

- 2.2.9.1.10** Környezetre (vízi környezetre) veszélyes anyagok

- 2.2.9.1.10.1** Általános fogalommeghatározás

- 2.2.9.1.10.1.1** Környezetre veszélyes anyagok – többek között – a vízi környezetet szennyező folyékony vagy szilárd anyagok, valamint az ilyen anyagok oldatai és keverékei (készítmények és hulladékok).

A 2.2.9.1.10 pont alkalmazásában az „anyag” olyan természetes állapotban előforduló vagy gyártási folyamatból származó kémiai elem és vegyületei, amely a termék stabilitásának megőrzéséhez szükséges adalékanyagot és az alkalmazott eljárásból származó szennyezőt is tartalmazhat, de nem tartalmaz olyan oldószert, amely az anyag stabilitásának befolyásolása vagy összetételének megváltoztatása nélkül elkülöníthető.

- 2.2.9.1.10.1.2** A vízi környezet a vízben élő vízi szervezetek, ill. a vízi életközösség szempontjából, értelmezendő, amelynek a vízi szervezetek a részét képezik.<sup>11)</sup> Ezért a veszély azonosításának alapja az anyag, ill. keverék vízi toxicitása, ezt azonban módosíthatják a lebomlásra és a bioakkumulációra vonatkozó további adatok.

- 2.2.9.1.10.1.3** A következő besorolási eljárás célja, hogy mindenfajta anyagra, ill. keverékre alkalmazni lehessen, tudatában kell lenni azonban, hogy bizonyos esetekben, pl. fémeknél vagy nehezen oldható szervesetlen vegyületeknél különleges útmutatás<sup>12)</sup> szükséges.

- 2.2.9.1.10.1.4** Az itt használt kifejezések és betűszavak jelentése a következő:

- *BCF*: biokoncentrációs tényező
- *BOD*: biokémiai oxigénigény

11) Ez nem vonatkozik az olyan vízszennyező anyagokra, amelyeknél a vízi környezeten túlmenő hatásokat, pl. az emberi egészségre gyakorolt hatást is szükséges lehet figyelembe venni.

12) Megtalálható a GHS 10 Mellékletében.

- *COD*: kémiai oxigénigény
- *GLP*: helyes laboratóriumi gyakorlat
- *EC<sub>50</sub>*: az anyag tényleges koncentrációja, amely a legnagyobb válaszreakció 50%-át eredményezi;
- *ErC<sub>50</sub>*: a növekedés csökkenése szempontjából meghatározott *EC<sub>50</sub>* érték
- *K<sub>ow</sub>*: oktanol/víz megoszlási együttható;
- *LC<sub>50</sub>* (50%-os halálos koncentráció): az anyag azon koncentrációja a vízben, amely a kísérleti állatcsoport 50%-ának (felének) elhullását okozza;
- *L(E)C<sub>50</sub>*: *LC<sub>50</sub>* vagy *EC<sub>50</sub>*;
- *NOEC* (No Observed Effect Concentration): észlelhető hatást nem okozó koncentráció;
- OECD Test Guidelines: a Gazdasági Együttműködési és Fejlesztési Szervezet (OECD) által kiadott vizsgálati irányelvek.

#### 2.2.9.1.10.2 Fogalommeghatározás és az adatokra vonatkozó követelmények

##### 2.2.9.1.10.2.1 A környezetre (vízi környezetre) veszélyes anyagok besorolásának alapvető elemei.

- akut vízi toxicitás;
- a bioakkumulációs hajlam vagy a tényleges bioakkumuláció;
- szerves vegyianyagok (biotikus vagy abiotikus) lebomlása;
- krónikus vízi toxicitás.

##### 2.2.9.1.10.2.2 A harmonizált nemzetközi vizsgálati módszerek alapján nyert adatok előnyösebbek, a gyakorlatban azonban a belföldi vizsgálati módszerek alapján nyert adatok is alkalmazhatók, ha egyenértékűnek tekinthetők. Általánosan elfogadott, hogy az édesvízi és a tengeri fajokra vonatkozó toxicitás azonosnak tekinthető és lehetőleg az OECD vizsgálati irányelvek vagy azzal egyenértékű módszerek alapján kell levezetni, a helyes laboratóriumi gyakorlat (*GLP*) alapelvei szerint. Ha így nyert adatok nincsenek, a besorolást a rendelkezésre álló legjobb adatok alapján kell elvégezni.

##### 2.2.9.1.10.2.3 Az **akut vízi toxicitást** általában a halra vonatkozó 96 órás *LC<sub>50</sub>* (OECD 203 vizsgálati irányelv vagy azzal egyenértékű módszer), a rákfajokra vonatkozó 48 órás *LC<sub>50</sub>* (OECD 202 vizsgálati irányelv vagy azzal egyenértékű módszer) és/vagy az alga fajokra vonatkozó 72 vagy 96 órás *EC<sub>50</sub>* (OECD 201 vizsgálati irányelv vagy azzal egyenértékű módszer) értékek felhasználásával kell meghatározni. Ezekkel a fajokkal bármely vízi szervezetek helyettesíthetők, ill. más fajokkal, pl. békalecsével (*Lemna*-val) nyert adatok is használhatók, ha a vizsgálati módszer megfelelő.

##### 2.2.9.1.10.2.4 A **bioakkumuláció** (biológiai felhalmozódás) az élő szervezetbe bármilyen expozíciós úton (azaz levegőből, vízből, üledékből, talajból, táplálékkal) bekerült anyagnak az átalakítás és kiválasztás után a szervezetben maradt nettó mennyiségét jelenti.

A **bioakkumulációs hajlamot** általában az oktanol/víz megoszlási együtthatóval kell meghatározni, amit az OECD 107 vagy 117 vizsgálati irányelv szerint meghatározott  $\log K_{ow}$ -ban szoktak megadni. Ezzel ugyan jól jellemezhető a bioakkumulációs hajlam, de a kísérletileg meghatározott: biokoncentrációs tényező (*BCF*) jobb eredményt ad, ezért ha lehetséges, ezt kell használni. A *BCF*-t az OECD 305 vizsgálati irányelv szerint kell meghatározni.

**2.2.9.1.10.2.5** A **környezetben való lebomlás** lehet biotikus vagy abiotikus (pl. hidrolízis), ez a tény a kritériumokban figyelembe van véve. A könnyű biológiai lebonthatóság legegyszerűbben az OECD biológiai lebonthatósági vizsgálatával [OECD 301 vizsgálati irányelv (A–F)] határozható meg. Ha egy anyag ezekben a vizsgálatokban közepes eredményt mutat, abból arra lehet következtetni, hogy a legtöbb környezetben gyorsan lebomlik. Tekintettel arra, hogy ezek a vizsgálatok édesvízre vonatkoznak, a tengeri környezetre alkalmasabb, OECD 306 vizsgálati irányelv alapján nyert eredményeket is figyelembe vették. Ha ilyen adat nem áll rendelkezésre, a gyors lebomlásra akkor lehet következtetni, ha az ötnapos  $BOD$  és a  $COD$  hányadosa ( $BOD_5/COD$ )  $\geq 0,5$ .

A gyors lebonthatóság meghatározásánál az abiotikus lebomlás (pl. hidrolízis), az elsődleges biotikus és az elsődleges abiotikus lebomlás, nemvízes közegben való lebomlás és a környezetben való bizonyítottan gyors lebomlás, mind figyelembe vehető<sup>13)</sup>.

Egy anyag akkor tekintendő a környezetben gyorsan lebomlóknak, ha a következő kritériumoknak megfelel:

- a) a 28 napos könnyű biológiai lebonthatósági vizsgálat során a következő lebomlási szinteket éri el:
  - i) az oldott szerves széntartalom alapuló vizsgálatnál: 70%-ot;
  - ii) az oxigén fogyáson vagy a szén-dioxid képződésen alapuló vizsgálatnál: az elméleti maximumok 60%-át.

Ezeket az értékeket 10 napon belül kell elérni attól a naptól kezdve, amikor a biológiai lebomlás első alkalommal 10% felett volt; vagy

- b) ha csak a  $BOD$  és a  $COD$  értékek állnak rendelkezésre:  $BOD_5/COD \geq 0,5$ ; vagy
- c) egyéb, meggyőző tudományos bizonyíték van arra, hogy az anyag, ill. keverék a vízi környezetben, 28 napon belül 70% fölötti mértékben lebomlik (biotikus és/vagy abiotikus úton).

**2.2.9.1.10.2.6** A **krónikus toxicitás**ra kevesebb adat áll rendelkezésre, mint az akut toxicitásra, és a vizsgálati eljárások is kevésbé egységesek. Az OECD 210 (hal korai életszakasz) vagy 211 (vízibolha szaporodás) vizsgálati irányelv, valamint az OECD 201 (alganövekedés gátlása) vizsgálati irányelv alapján nyert adatok elfogadhatók. Egyéb, nemzetközileg elismert, hiteles vizsgálatok is alkalmazhatók. Az „észlelhető hatást nem okozó koncentráció”-t ( $NOEC$ ) vagy más, egyenértékű  $L(E)C_x$  értéket kell használni.

**2.2.9.1.10.3** Az anyagok besorolási kategóriái és kritériumai

Egy anyagot akkor kell a „környezetre (vízi környezetre) veszélyes anyag”-nak besorolni, ha a következő táblázatokban az akut-1 kategóriára, a krónikus-1 kategóriára vagy a krónikus-2 kategóriára feltüntetett kritériumok teljesülnek:

#### Akut toxicitás

<b>Kategória: Akut-1</b>	
Akut toxicitás:	
96 órás $LC_{50}$ (halra)	$\leq 1$ mg/l és/vagy
48 órás $EC_{50}$ (rákokra)	$\leq 1$ mg/l és/vagy
72 vagy 96 órás $ErC_{50}$ (algákra vagy egyéb vízinövényekre)	$\leq 1$ mg/l

13) Az adatok értelmezésére különleges útmutatás található a GHS 4.1 fejezetében és 9 Mellékletében.

**Krónikus toxicitás****Kategória: Krónikus-1**

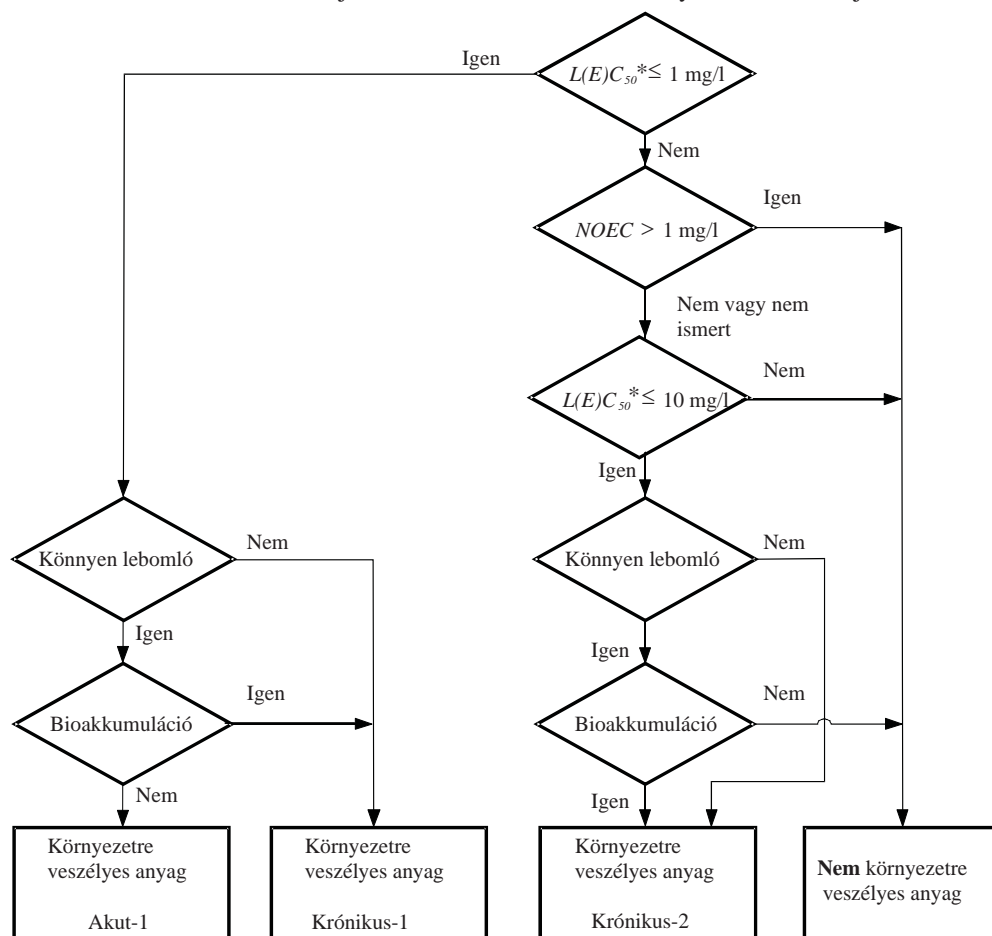

Akut toxicitás:

96 órás  $LC_{50}$  (halra)  $\leq 1$  mg/l és/vagy48 órás  $EC_{50}$  (rákokra)  $\leq 1$  mg/l és/vagy72 vagy 96 órás  $ErC_{50}$  (algákra vagy egyéb vízínövényekre)  $\leq 1$  mg/lés az anyag nem bomlik le gyorsan és/vagy a  $\log K_{ow} \geq 4$  (kivéve, ha a kísérletileg meghatározott  $BCF < 500$ )**Kategória: Krónikus-2**

Akut toxicitás:

96 órás  $LC_{50}$  (halra)  $>1 - \leq 10$  mg/l és/vagy48 órás  $EC_{50}$  (rákokra)  $>1 - \leq 10$  mg/l és/vagy72 vagy 96 órás  $ErC_{50}$  (algákra vagy egyéb vízínövényekre)  $>1 - \leq 10$  mg/lés az anyag nem bomlik le gyorsan és/vagy a  $\log K_{ow} \geq 4$  (kivéve, ha a kísérletileg meghatározott  $BCF < 500$ ), kivéve ha a krónikus toxicitás  $NOEC$  szintek  $> 1$  mg/l

A követendő eljárást a következő besorolási folyamatábra mutatja

\* A 96 órás  $LC_{50}$ , a 48 órás  $EC_{50}$ , ill. a 72 órás vagy 96 órás  $ErC_{50}$  közül a legkisebb érték.

#### 2.2.9.1.10.4 A keverékek besorolási kategóriái és kritériumai

**2.2.9.1.10.4.1** A keverékek besorolási rendszeréhez tartoznak az anyagok besorolásához használt kategóriák, azaz az akut-1, a krónikus-1 és a krónikus-2 kategória. Annak érdekében, hogy a keverék vízi környezetre való veszélyességének besorolásához az összes rendelkezésre álló adatot felhasználjuk, a következő feltételezést használjuk:

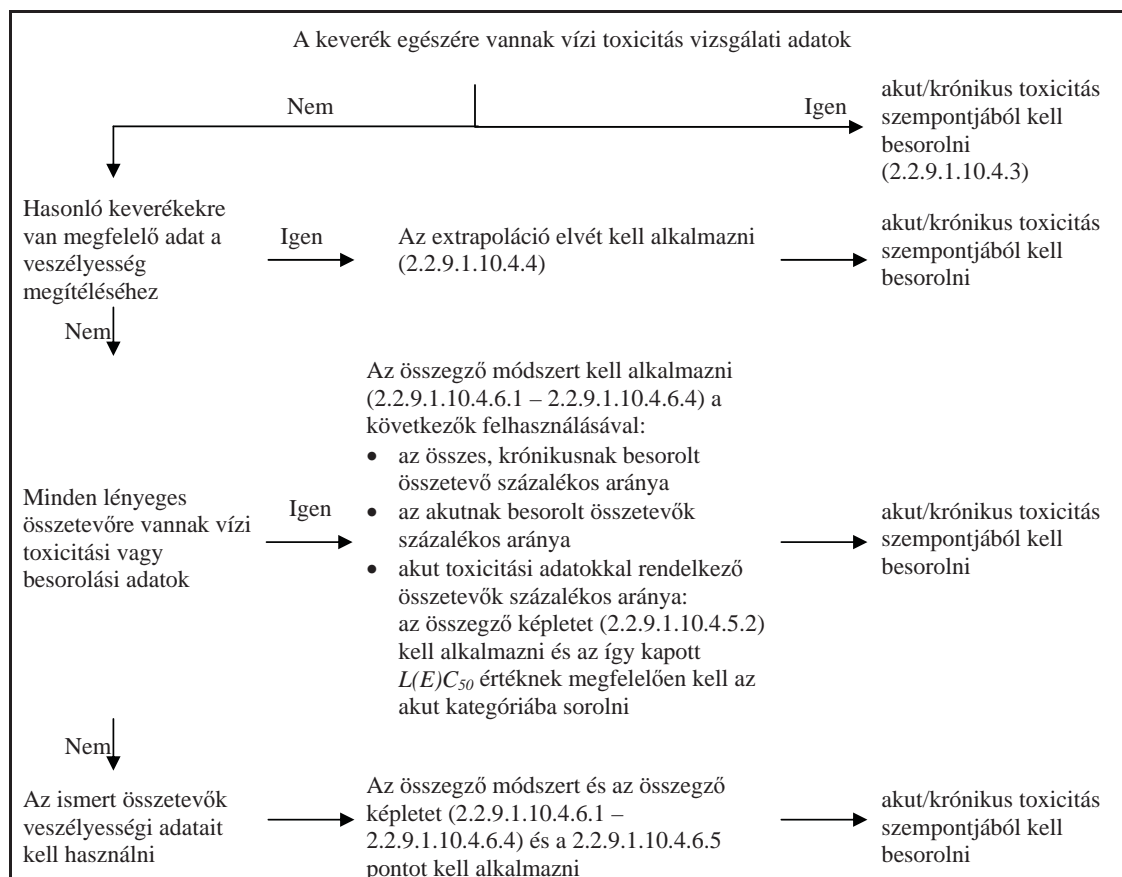

A „lényeges összetevő” a keverékben leglább 1 tömeg%-ban jelenlévő összetevő, kivéve, ha feltételezhető, hogy valamelyik 1 tömeg%-nál kisebb koncentrációban jelenlévő összetevő is lényeges a keverék vízi környezetre való veszélyességének besorolásához (pl. nagyon mérgező összetevők esetében).

**2.2.9.1.10.4.2** A vízi környezetre való veszélyesség besorolásának menete lépcsőzetes, és attól függ, hogy milyen adatok állnak rendelkezésre az egész keverékre, ill. az összetevőire. A lépcsőzetes besorolás elemei a következők:

- a keverékkel végzett vizsgálaton alapuló besorolás;
- az extrapoláció elvén alapuló besorolás;
- „a besorolt összetevők összegzése” módszer és/vagy az „összegző képlet” használata.

A követendő eljárást a következő 2.2.9.1.10.4.2 ábra mutatja.

#### 2.2.9.1.10.4.2 ábra: A keverékek akut és krónikus vízi környezeti veszélyességének lépcsőzetes besorolása

**2.2.9.1.10.4.3** Keverékek besorolása abban az esetben, ha a keverék egészére vannak adatok

**2.2.9.1.10.4.3.1** Ha a keverék egészének vízi toxicitását megvizsgálták, akkor az anyagokra elfogadott kritériumok szerint kell besorolni, de csak akut toxicitás tekintetében. A besorolás a halra, a rákokra és az algákra vagy egyéb vízinövényekre nyert adatokon alapul. A keverék egészére vonatkozó  $LC_{50}$ , ill.  $EC_{50}$  értékek alapján a krónikus kategóriákba nem lehet besorolni a keveréket, mivel ahhoz a toxicitási adatok és a környezeti hatásra vonatkozó adatok egyaránt szükségesek, és a keverékekre nem léteznek lebomlásra és bioakkumulációra vonatkozó adatok. A krónikus kategóriák besorolási kritériumait azért nem lehet alkalmazni, mert a lebomlási és bioakkumulációs vizsgálati adatok csak egyedi anyagokra értelmezhetők, keverékekre nem.

**2.2.9.1.10.4.3.2** Ha a keverék egészének akut toxicitására vannak adatok ( $LC_{50}$ , ill.  $EC_{50}$ ), akkor ezeket az adatokat és az összetevők krónikus toxicitás szerinti besorolására vonatkozó ismereteket kell felhasználni a vizsgált keverék besorolásának véglegesítéséhez, a következők szerint. Ha a krónikus (hosszú távú) toxicitásra vonatkozóan *NOEC* adatok is vannak, akkor azokat is fel kell használni.

- a) A vizsgált keverék  $L(E)C_{50}$  ( $LC_{50}$  vagy  $EC_{50}$ ) értéke  $\leq 1$  mg/l és a *NOEC* értéke  $\leq 1,0$  mg/l vagy nem ismert:
  - a keveréket az akut-1 kategóriába kell sorolni ;
  - „a besorolt összetevők összegzése” módszert kell alkalmazni (lásd a 2.2.9.1.10.4.6.3 és a 2.2.9.1.10.4.6.4 pontot) a krónikus toxicitás megítéléséhez (krónikus-1, krónikus-2 vagy nem kell krónikus kategóriába sorolni);
- b) A vizsgált keverék  $L(E)C_{50}$  értéke  $\leq 1$  mg/l és a *NOEC* értéke  $> 1$  mg/l:
  - a keveréket az akut-1 kategóriába kell sorolni ;
  - „a besorolt összetevők összegzése” módszert kell alkalmazni (lásd a 2.2.9.1.10.4.6.3 és a 2.2.9.1.10.4.6.4 pontot) a krónikus-1 kategóriába való besoroláshoz. Ha a keverék nem tartozik a krónikus-1 kategóriába, akkor nem kell krónikus kategóriába sorolni);
- c) A vizsgált keverék  $L(E)C_{50}$  értéke  $> 1$  mg/l vagy nagyobb, mint a vízben való oldhatóság értéke és a *NOEC* értéke  $\leq 1,0$  mg/l vagy nem ismert
  - nem kell akut toxicitás szerint besorolni;
  - „a besorolt összetevők összegzése” módszert kell alkalmazni (lásd a 2.2.9.1.10.4.6.3 és a 2.2.9.1.10.4.6.4 pontot) krónikus kategóriába való besoroláshoz vagy nem kell krónikus kategóriába sorolni;
- d) A vizsgált keverék  $L(E)C_{50}$  értéke  $> 1$  mg/l vagy nagyobb, mint a vízben való oldhatóság értéke és a *NOEC* értéke  $> 1,0$  mg/l:
  - sem akut, sem krónikus kategóriába nem kell sorolni.

**2.2.9.1.10.4.4** Az extrapoláció elve

**2.2.9.1.10.4.4.1** Ha magát a keveréket nem vizsgálták a vízi környezetre való veszélyességének megállapítására, viszont az egyes összetevőkre és hasonló, megvizsgált keverékekre elegendő adat áll rendelkezésre ahhoz, hogy a keverék veszélyességét megfelelően jellemezze, akkor ezeket az adatokat kell használni a következő, elfogadott extrapolációs szabály szerint. Ez biztosítja, hogy a besorolási eljárás folyamán a rendelkezésre álló adatokat a lehető legnagyobb mértékben felhasználjuk a keverék veszélyességének jellemzésére, anélkül, hogy további állatkísérletekre volna szükség.

**2.2.9.1.10.4.4.2 Hígítás**

**2.2.9.1.10.4.4.2.1** Abban az esetben, ha egy keveréket egy már besorolt másik keverék vagy anyag olyan hígítószerrel történő hígításával állítottak elő, amelynek a vízi környezetre való veszélyessége azonos vagy kisebb mértékű, mint a legkevésbé toxikus eredeti összetevőé, és amely valószínűleg nem befolyásolja a többi összetevő vízi környezetre való veszélyességét, akkor a keveréket az eredeti keverékkel, ill. anyaggal azonosan kell besorolni.

**2.2.9.1.10.4.4.2.2** Abban az esetben, ha egy keveréket egy másik besorolt keverék vagy anyag vízzel vagy más, egyáltalán nem mérgező anyaggal történő hígításával állítottak elő, a keverék toxicitását az eredeti keverék, ill. anyag alapulvételével kell kiszámítani.

**2.2.9.1.10.4.4.3 Gyártási tételek**

Egy komplex keverék valamely gyártási tételének a vízi környezetre való veszélyességi besorolása és ugyanakkor a kereskedelmi terméknek, ugyanazon gyártó által, vagy ugyanazon gyártó felügyelete mellett gyártott másik gyártási tételének besorolása alapvetően azonosnak tekintendő, kivéve, ha okkal feltételezhető, hogy olyan jelentős változás következett be, amely a gyártási tételnek a vízi környezetre való veszélyességi besorolását is megváltoztatta. Ez esetben új besorolási eljárás szükséges.

**2.2.9.1.10.4.4.4** A legszigorúbb (krónikus-1 és akut-1) kategóriákba sorolt keverékek koncentrációjának növelése

Ha egy krónikus-1 és/vagy akut-1 kategóriába sorolt keverékben a krónikus-1 és/vagy akut-1 kategóriába sorolt összetevők koncentrációját tovább növeljük, a nagyobb koncentrációjú keveréket – további vizsgálat nélkül – ugyanabba a kategóriába kell sorolni, mint az eredeti keveréket.

**2.2.9.1.10.4.4.5** Egy toxikussági kategórián belüli interpoláció

Három, azonos összetevőket tartalmazó keverék esetén, ha A keverék és B keverék ugyanabba a kategóriába tartozik és a C keverékben a toxikológiailag aktív összetevők koncentrációja az A és B keverékben lévő koncentrációk közé esik, ezt a C keveréket ugyanabba a kategóriába kell sorolni, mint az A és a B keveréket.

**2.2.9.1.10.4.4.6** Alapvetően azonos keverékek

Ha adottak a következők:

- a) két keverék:
  - i) A + B;
  - ii) C + B,
- b) a B összetevő koncentrációja a két keverékben azonos;
- c) az A összetevő koncentrációja az i) pont szerinti keverékben azonos a C összetevő koncentrációjával az ii) pont szerinti keverékben;
- d) az A és a C besorolása ismert és azonos, vagyis ugyanabba a veszélyességi kategóriába tartoznak, és nem valószínű, hogy a B összetevő vízi toxicitását befolyásolnák,

akkor az ii) pont szerinti keveréket nem kell vizsgálni, ha az i) pont szerinti keveréket megvizsgálták és mindkét keveréket ugyanabba a kategóriába sorolják.

**2.2.9.1.10.4.5** Keverékek besorolása abban az esetben, ha a keverék mindegyik összetevőjére vagy csak néhányra vannak adatok

**2.2.9.1.10.4.5.1** A keverék besorolását a besorolt összetevők koncentrációjának összegzésére kell alapozni. Az „akut”, ill. „krónikus” kategóriába sorolt összetevők százalékos aránya az összegző módszer kiinduló adata. Az összegző módszer részletei a 2.2.9.1.10.4.6.1 – 2.2.9.1.10.4.6.4 pontokban találhatók.

**2.2.9.1.10.4.5.2** Egy keverék lehet már besorolt (akut-1 és/vagy krónikus-1, krónikus-2) összetevők és olyan összetevők kombinációja, amelyekre vannak megfelelő vizsgálati adatok. Ha a keverék több összetevőjére van megfelelő toxicitási adat, akkor ezeknek az összetevőknek az együttes toxicitását a következő összegző képlettel kell kiszámolni, és a kiszámított toxicitás alapján kell a keverék ezen részének akut toxicitási veszélyét meghatározni, amit azután az összegző módszerben használunk.

$$\frac{\sum C_i}{L(E)C_{50m}} = \sum_n \frac{C_i}{L(E)C_{50i}}$$

ahol:

$C_i$  = az  $i$ -edik összetevő koncentrációja (tömeg%);

$L(E)C_{50i}$  = az  $i$ -edik összetevő  $LC_{50}$  vagy  $EC_{50}$  értéke (mg/l);

$n$  = az összetevők száma,  $i = 1 - n$  ;

$L(E)C_{50m}$  = a keverék azon részének  $L(E)C_{50}$  értéke, amelyre van toxicitási adat.

**2.2.9.1.10.4.5.3** Amikor a keverék egy részére az összegző képletet alkalmazzuk, előnyös, ha a keverék ezen része toxicitását az egyes anyagok azonos fajra (halra, vízipótlára vagy algára) vonatkozó toxicitási értékeivel kiszámoljuk, és azután a kapott legnagyobb toxicitási értéket (azaz a legkisebb értéket) használjuk (vagyis a három faj közül a legérzékenyebbre vonatkozót). Ha azonban nincs minden összetevőre azonos fajra vonatkozó toxicitási adat, az egyes összetevőkre vonatkozóan a toxicitási adatot ugyanúgy kell kiválasztani, mint ahogy az anyagok besorolásánál kell a toxicitási adatot kiválasztani, vagyis a nagyobb toxicitási értéket (a legérzékenyebb vizsgálati élő szervezetre vonatkozót) kell használni. Az így kiszámított akut toxicitás érték alapján kell a keverék ezen részét az akut-1 kategóriához sorolni, ugyanazon kritériumok szerint, mint amelyek az anyagokra vonatkoznak.

**2.2.9.1.10.4.5.4** Ha egy keveréket többféleképpen sorolnak be, a legszigorúbb eredményt adó módszert kell alkalmazni.

**2.2.9.1.10.4.6** Összegző módszer

**2.2.9.1.10.4.6.1** Besorolási eljárás

Általában a keverékeknél a szigorúbb besorolás megelőzi a kevésbé szigorút, például a krónikus-1 kategóriába való besorolás megelőzi a krónikus-2-be való sorolást. Ennek következtében, ha a besorolás eredménye krónikus-1 kategória, a besorolási eljárás befejeződik. Mivel a krónikus-1 kategóriánál nincs szigorúbb, ezért nem szükséges a besorolási eljárást folytatni.

**2.2.9.1.10.4.6.2** Az akut-1 kategóriába való sorolás

**2.2.9.1.10.4.6.2.1** Az akut-1 kategóriába sorolt minden összetevőt figyelembe kell venni (össze kell adni). Ha

az összegük 25% vagy annál nagyobb, az egész keveréket az akut-1 kategóriába kell sorolni. Ha a számítás eredménye az, hogy a keverék az akut-1 kategóriába tartozik, a besorolási eljárás befejeződött.

**2.2.9.1.10.4.6.2.2** A keverék akut veszély szerinti besorolása a besorolt összetevők összegzésén alapul, amely a 2.2.9.1.10.4.6.2.2 táblázatban van összefoglalva.

**2.2.9.1.10.4.6.2.2 táblázat: A keverék akut veszély szerinti besorolása a besorolt összetevők összegzése alapján**

Az adott kategóriába besorolt összetevők összege	A keverék besorolása
$\text{akut-1} \times M^{(a)} \geq 25\%$	akut-1

a) Az  $M$  tényező magyarázatára lásd a 2.2.9.1.10.4.6.4 pontot.

**2.2.9.1.10.4.6.3** A krónikus-1 és krónikus-2 kategóriába való sorolás

**2.2.9.1.10.4.6.3.1** A krónikus-1 kategóriába sorolt összetevőket össze kell adni. Ha az összeg 25% vagy annál nagyobb, az egész keveréket a krónikus-1 kategóriába kell sorolni. Ha a számítás eredménye az, hogy a keverék a krónikus-1 kategóriába tartozik, a besorolási eljárás befejeződött.

**2.2.9.1.10.4.6.3.2** Ha a keverék nem tartozik a krónikus-1 kategóriába, akkor a krónikus-2 kategóriába való sorolás szempontjából kell vizsgálni. Akkor kell a keveréket a krónikus-2 kategóriába sorolni, ha a krónikus-1 kategóriába sorolt összetevők összegének 10-szerese és a krónikus-2 kategóriába sorolt összetevők összege együttesen 25% vagy annál nagyobb. Ha a számítás eredménye az, hogy a keverék a krónikus-2 kategóriába tartozik, a besorolási eljárás befejeződött.

**2.2.9.1.10.4.6.3.3** A keverék krónikus veszély szerinti besorolása a besorolt összetevők összegzésén alapul, amely a 2.2.9.1.10.4.6.3.3 táblázatban van összefoglalva.

**2.2.9.1.10.4.6.3.3 táblázat: A keverék krónikus veszély szerinti besorolása a besorolt összetevők összegzése alapján**

Az adott kategóriába besorolt összetevők összege	A keverék besorolása:
$\text{krónikus-1} \times M^{(a)} \geq 25\%$	krónikus-1
$(M^{(a)} \times 10 \times \text{krónikus-1}) + \text{krónikus-2} \geq 25\%$	krónikus-2

a) Az  $M$  tényező magyarázatára lásd a 2.2.9.1.10.4.6.4 pontot.

**2.2.9.1.10.4.6.4** Nagyon mérgező összetevőket tartalmazó keverékek

Az olyan, akut-1 kategóriába sorolt összetevők, amelyek toxicitása jóval kisebb 1 mg/l-nél, befolyásolhatják az egész keverék toxicitását, ezért az összegző módszerben súlyozottan vannak figyelembe véve. Ha a keverékben van akut-1 vagy krónikus-1 kategóriába sorolt összetevő, a 2.2.9.1.10.4.6.2 és 2.2.9.1.10.4.6.3 pontban leírt lépcsőzetes eljárást kell alkalmazni, amelyben az összetevők százalékos arányának egyszerű összeadása helyett egy súlyozott összeget használunk, amely az akut-1 kategóriájú összetevők koncentrációjának és egy tényezőnek a szorzata. Ez azt jelenti, hogy a 2.2.9.1.10.4.6.2.2, ill. a 2.2.9.1.10.4.6.3.3 táblázatok bal oldali oszlopában az akut-1, ill. krónikus-1 kategóriájú összetevők koncentrációja a megfelelő tényezővel megszorozva szerepel. A szorzótényező az összetevők toxicitása alapján van meghatározva, és a következő 2.2.9.1.10.4.6.4 táblázatban szerepel. Ezért az akut-1 és/vagy krónikus-1 kategóriába sorolt összetevőket tartalmazó keverékek összegző módszerrel történő besorolásához ismerni kell az  $M$  tényező értékét. Ehelyett az összegző képlet is alkalmazható (lásd a 2.2.9.1.10.4.5.2 pontot), ha a keverékben lévő minden, nagyon mérgező összetevőre van toxicitási adat és elegendő bizonyíték van arra, hogy a többi összetevő (beleértve azokat is, amelyekre akut toxicitási adatok nem állnak

rendelkezésre), csak enyhén vagy egyáltalán nem mérgező, és nem befolyásolják jelentősen a keverék környezetre való veszélyességét.

**2.2.9.1.10.4.6.4 táblázat: A keverékek nagyon mérgező összetevőikhez tartozó szorzótényezők**

<i><math>L(E)C_{50}</math> érték</i>	<i>Szorztényező (M)</i>
$0,1 < L(E)C_{50} \leq 1$	1
$0,01 < L(E)C_{50} \leq 0,1$	10
$0,001 < L(E)C_{50} \leq 0,01$	100
$0,0001 < L(E)C_{50} \leq 0,001$	1000
$0,00001 < L(E)C_{50} \leq 0,0001$	10000
(további tizedes intervallumonként folytatva)	

**2.2.9.1.10.4.6.5 Keverék besorolása abban az esetben, ha nincs az összetevőkre használható információ**

Abban az esetben, ha a keverék valamely lényeges összetevőjének vízi környezetre való, akut és/vagy krónikus veszélyességére nincs használható adat, a keveréket nem lehet határozott veszélyességi kategóriába sorolni. Ebben az esetben a keveréket az ismert összetevők alapján kell besorolni, és ki kell egészíteni a következő megállapítással: „A keverék x %-a olyan összetevő(k)ből áll, amely(ek)nek vízi környezetre való veszélyessége nem ismert.”

**2.2.9.1.10.5 A RID alá másként nem sorolt, vízi környezetre veszélyes anyagok és keverékek**

**2.2.9.1.10.5.1 A RID alá másként nem sorolt, vízi környezetre veszélyes anyagokat és keverékeket a következő tételek alá kell sorolni:**

UN 3077 KÖRNYEZETRE VESZÉLYES SZILÁRD ANYAG, M.N.N.

UN 3082 KÖRNYEZETRE VESZÉLYES FOLYÉKONY ANYAG, M.N.N.

Ezek a tételek a III csomagolási csoportba tartoznak.

**2.2.9.1.10.5.2 A 2.2.9.1.10 pont előírásaival ellentétben**

- azokat az anyagokat, amelyek sem a 9 osztály valamely tétele alá – az UN 3077 és az UN 3082 kivételével –, sem az 1 – 8 osztály tételei alá nem sorolhatók, de amelyek a Tanács veszélyes anyagok osztályozására, csomagolására és címkézésére vonatkozó törvényi, rendeleti és közigazgatási rendelkezések közelítéséről szóló, módosított 1967. június 27-i 67/548/EGK Irányelve<sup>14)</sup> szerint „Környezetre veszélyes”-ek, azaz „N” betű (R50; R50/53; R51/53) van hozzájuk rendelve; és
- azon anyagok oldatait és keverékeit (készítményeit és hulladékait), amelyek a módosított 67/548/EGK Irányelv szerint „Környezetre veszélyes”-ek, azaz „N” betű (R50; R50/53; R51/53) van hozzájuk rendelve, és amelyek az Európai Parlament és a Tanács a tagállamoknak veszélyes készítmények osztályozására, csomagolására és címkézésére vonatkozó törvényi, rendeleti és közigazgatási rendelkezések közelítéséről szóló 1999. május 31-i, módosított 1999/45/EK Irányelve<sup>15)</sup> szerint is „Környezetre veszélyes”-ek, azaz „N” betű (R50; R50/53; R51/53) van hozzájuk rendelve és nem sorolhatók sem a 9 osztály valamely tétele alá – az UN 3077 és az UN 3082 kivételével –, sem az 1 – 8 osztály tételei alá,

a 9 osztály UN 3077, ill. UN 3082 tétel alá kell besorolni.

14) Az EK Hivatalos Lapja, L 196. szám, 1967.08.16., 1 - 5. o.).

15) Az EK Hivatalos Lapja, L 200. szám, 1999.07.30., 1 - 68. o.).

*Géntechnológiával módosított mikroorganizmusok és élő szervezetek*

- 2.2.9.1.11** A géntechnológiával módosított mikroorganizmusok (GMMO-k) és élő szervezetek (GMO-k) olyan mikroorganizmusok és élő szervezetek, amelyek genetikai anyagát szándékosan, génszabványi beavatkozással úgy változtatták meg, ami a természetben nem fordul elő. Ezek a 9 osztályba, az UN 3245 tétel alá tartoznak, ha nem elégték ki a fertőző anyagok meghatározását, de képesek az állatokat, növényeket vagy mikrobiológiai anyagokat oly módon megváltoztatni, ami a természetes reprodukció eredményeként rendszerint nem következik be.

**Megjegyzés:** 1. Azok a GMMO-k és GMO-k, amelyek fertőzőek, a 6.2 osztály UN 2814, UN 2900, ill. UN 3373 szám anyagai.

2. Azok a GMMO-k és GMO-k, amelyek felhasználását a származási, a tranzit és a célország illetékes hatóságai engedélyezték<sup>16)</sup>, nem tartoznak a RID előírásainak hatálya alá.

3. Élő állatok a 9 osztályba besorolt géntechnológiával módosított mikroorganizmusok szállítására nem használhatók, hacsak az anyag más módon nem szállítható.

- 2.2.9.1.12** (fenntartva)

*Magas hőmérsékletű anyagok*

- 2.2.9.1.13** A magas hőmérsékletű anyagok olyan anyagok, amelyeket folyékony állapotban 100 °C-on vagy annál magasabb hőmérsékleten, de amennyiben van lobbanáspontjuk, akkor a lobbanáspont alatti hőmérsékleten szállítanak vagy adnak át szállításra. Ide tartoznak azok a szilárd anyagok, amelyeket 240 °C-on vagy annál magasabb hőmérsékleten szállítanak vagy adnak át szállításra.

**Megjegyzés:** A magas hőmérsékletű anyagok csak akkor sorolhatók a 9 osztályba, ha egyetlen más osztály feltételeit sem elégték ki.

*Egyéb anyagok, amelyek a szállítás alatt veszélyt jelentenek, de egyetlen más osztály meghatározásának sem felelnek meg*

- 2.2.9.1.14** A következő egyéb anyagok, amelyek egyetlen más osztály meghatározásának sem felelnek meg, a 9 osztályba vannak besorolva:

szilárd ammóniumvegyületek 60 °C alatti lobbanásponttal  
csekély veszélyt képviselő ditionitok  
erősen illékony folyékony anyagok  
ártalmas gőzöket kibocsátó anyagok  
allergéneket tartalmazó anyagok  
vizsgáló-készletek és elsősegély felszerelések.

**Megjegyzés:** A következő anyagok és tárgyak, amelyeket az ENSZ Minta Szabályzat felsorol, nem esnek a RID előírásainak hatálya alá: UN 1845 szilárd széndioxid (szárazjég), UN 2071 ammónium-nitrát alapú műtrágya, UN 2216 stabilizált halliszt (halhulladék), UN 2807 mágnesezett anyag, UN 3166 belsőégésű motor vagy gyúlékony gáz üzemű jármű vagy gyúlékony folyadék

16) Lásd részletesen a géntechnológiával módosított szervezeteknek a környezetben történő szándékos kibocsátásáról és a 90/220/EGK Tanácsi Irányelv hatályaon kívül helyezéséről szóló 2001/18/EK Európai Parlamenti és Tanácsi Irányelv (az EK Hivatalos Lapja, L 106. szám, 2001.04.17., 8 – 14 o.) C részét, amely tartalmazza az Európai Közösség engedélyezési eljárásait. Magyarországon lásd az 1998. évi XXVII. tv-t a géntechnológiai tevékenységről, ill. a végrehajtására kiadott rendeleteket.

*üzemű jármű, UN 3171 akkumulátorral hajtott jármű vagy akkumulátorral hajtott készülék, UN 3334 légi forgalomban szabályozott folyadék, m.n.n., UN 3335 légi forgalomban szabályozott szilárd anyag, m.n.n. és UN 3363 veszélyes áru készülékben vagy veszélyes áru berendezésben.*

*Csomagolási csoporthoz való hozzárendelés*

**2.2.9.1.15** A 9 osztály anyagai és tárgyai a veszélyességük mértéke alapján a következő csomagolási csoportok valamelyikéhez vannak hozzárendelve, ha a 3.2 fejezet „A” táblázat (4) oszlopában ez fel van tüntetve:

II csomagolási csoport:            közepesen veszélyes anyagok  
III csomagolási csoport:        kevésbé veszélyes anyagok

**2.2.9.2** *A fuvarozásból kizárt anyagok és tárgyak*

A következő anyagok és tárgyak a fuvarozásból ki vannak zárva:

- azok a lítium akkumulátorok, amelyek nem felelnek meg a 3.3 fejezet 188, 230 vagy 636 különleges előírásának;
- azoknak a készülékeknek (pl. transzformátoroknak, kondenzátoroknak, hidraulikus berendezéseknek) az üres, tisztítatlan tartóedényei, amelyekben az UN 2315, 3151, 3152 vagy 3432 szám alá besorolt anyagok voltak.

**2.2.9.3 A gyűjtőmegnevezések felsorolása**

	Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése

Magas hőmérsékletű anyagok	szilárd anyagok	M10	3258 MAGAS HŐMÉRSÉKLETŰ SZILÁRD ANYAG, M.N.N. 240 °C-on vagy magasabb hőmérsékleten

**2.2.9.3      A gyűjtőmegnevezések felsorolása (folyt.)**

	Osztályozási kód	UN szám	Az anyag vagy tárgy megnevezése
Egyéb anyagok és tárgyak, amelyek a szállítás alatt veszélyt jelentenek, de egyetlen más osztály meghatározásának sem felelnek meg	M11		Itt nincs gyűjtőmegnevezés. Ezzel az osztályozási kóddal csak a 3.2 fejezet „A” táblázatában felsorolt anyagok tartoznak a 9 osztály előírásainak hatálya alá, ezek a következők:  1841 ACETALDEHID-AMMÓNIA 1931 CINK-DITIONIT 1941 DIBRÓM-DIFLUOR-METÁN 1990 BENZALDEHID 2969 RICINUSMAG vagy 2969 RICINUSMAG LISZT vagy 2969 RICINUSMAG PEHELY vagy 2969 RICINUSMAG POGÁCSA 3316 VIZSGÁLÓKÉSZLET vagy 3316 ELSŐSEGÉLY FELSZERELÉS 3359 GÁZOSÍTÓSZER HATÁSA ALATT ÁLLÓ EGYSÉG

## 2.3 fejezet

### Vizsgálati eljárások

#### 2.3.0      Általános előírások

Hacsak a 2.2 fejezetben vagy ebben a fejezetben nincs másként előírva, a veszélyes áruk besorolásához azokat a vizsgálati módszereket kell használni, amelyek a „Vizsgálatok és kritériumok kézikönyv”-ben találhatók.

#### 2.3.1      Kiizzadási vizsgálat az A típusú robbantóanyagokhoz

**2.3.1.1**      Az A típusú robbantóanyagokat (UN 0081), amennyiben folyékony salétromsav-észter tartalmuk a 40%-ot meghaladja, kiegészítésképpen a „Vizsgálatok és kritériumok kézikönyv”-ben meghatározott vizsgálatokon kívül a következő kiizzadási vizsgálatnak kell alávetni.

**2.3.1.2**      A robbantóanyagok kiizzadási vizsgálatának elvégzésére használt készülék (1 – 3. ábra) egy 40 mm magas, 15,7 mm belső átmérőjű üreges, talpas bronzhenger, amelynek talpa ugyanazon anyagból készült. A henger palástján 20 db 0,5 mm átmérőjű furat van (négy sorban öt-öt furat). Az 52 mm teljes hosszúságú, 48 mm hosszú, hengeres részű bronzdugattyú a függőleges helyzetű bronzhengerbe helyezhető; ez a 15,6 mm átmérőjű dugattyú 2220 g tömegű nehezékkal van terhelve úgy, hogy a henger fenekére 120 kPa (1,2 bar) nyomás hat.

**2.3.1.3**      5...8 g robbantóanyagból 30 mm hosszú és 15 mm átmérőjű hengert kell készíteni, amelyet igen finom gézbe kell becsavarni és a hengerbe kell helyezni; ezután rá kell helyezni a dugattyút a teherrel oly módon, hogy a robbantóanyagra 120 kPa (1,2 bar) nyomás hasson. Mélni kell a hengeren levő furatokban az első olajos cseppecskék (nitroglicerín) megjelenéséig eltelt időt.

**2.3.1.4**      A robbantóanyag megfelelő, ha az első cseppek megjelenéséig több mint öt perc telik el, ha a vizsgálatot 15...25 °C hőmérsékleten végezték.

## Robbantóanyagok kiizzadási vizsgálata

1. ábra: Harang alakú nehezék,  
tömege 2220 g, alkalmas a bronz dugattyúra  
történő ráhelyezésre

2. ábra: Hengeres bronzdugattyú,  
méretek mm-ben

3. ábra: Talpas bronzhenger, egyik végén zárt:  
felülnézet és oldalnézet metszettel,  
méretek mm-ben

Jelölések az 1 – 3. ábrához:

- 1) négy sorban öt-öt furat, átmérő 0,5 mm
- 2) réz
- 3) ólomlemez, belül centrikus kúppal
- 4) négy, kb. 46 mm x 56 mm méretű nyílás a kerület mentén egyforma távolságokra.

**2.3.2 A 4.1 osztály nitrocellulóz keverékeire vonatkozó feltételek**

**2.3.2.1** A nitrocellulóz 132 °C-on történő félórás melegítése során nem szabad hogy szemmel látható sárgásbarna nitrózus gázokat fejlesszen. A gyulladási hőmérsékletnek meg kell haladnia a 180 °C-ot. Lásd a következő 2.3.2.3 – 2.3.2.8, 2.3.2.9 a) és 2.3.2.10 bekezdést.

**2.3.2.2** 3 g plasztifikált nitrocellulóz 132 °C-on való egyórás melegítése során nem szabad hogy szemmel látható sárgásbarna nitrózus gőzöket fejlesszen. A gyulladási hőmérsékletnek meg kell haladni a 170 °C-ot. Lásd a következő 2.3.2.3 – 2.3.2.8, 2.3.2.9 b) és 2.3.2.10 bekezdést.

**2.3.2.3** Ha az egyes anyagok vasúti fuvarozásának megengedett voltára nézve véleménykülönbség merül fel, a következőkben részletezett vizsgálatokat kell elvégezni.

**2.3.2.4** Amennyiben a kémiai állandóság vizsgálatára ebben a fejezetben nem szereplő, más vizsgálati módszert vagy eljárást alkalmaznak, ezeknek a módszereknek ugyanazt az eredményt kell adniuk, mintha a vizsgálatokat a következő módszerekkel végezték volna.

**2.3.2.5** A hőállóság következőkben leírt meghatározása során a vizsgálandó anyagot tartalmazó szárítószekrény hőmérséklete az előírttól 2 °C-nál nagyobb mértékben nem térhet el; a vizsgálati időtartamot a 30 vagy 60 perces vizsgálatoknál legfeljebb kétperces eltéréssel be kell tartani. A szárítószekrényt úgy kell kialakítani, hogy a vizsgálatához előírt hőmérsékletet a minta behelyezése után legkésőbb öt perc múlva elérje.

**2.3.2.6** A 2.3.2.9 és 2.3.2.10 bekezdés szerinti vizsgálatok előtt a mintákat legalább 15 órán át kell szárítani szobahőmérsékleten, kiizzított és granulált kalcium-kloriddal töltött vákuum-exszikkátorban. Ennek során a mintát vékony rétegben kell elteríteni, ezért a nem porszerű vagy nem szálas mintát apró darabokra kell vágdalni, le kell reszelni vagy össze kell törni. Az exszikkátorban a nyomásnak 6,5 kPa-nál (0,065 bar-nál) kisebbnek kell lennie.

**2.3.2.7** Az előző 2.3.2.6 bekezdésben leírt feltételek melletti szárítás előtt a 2.3.2.2 bekezdés szerinti anyagokat jól szellőztetett szárítószekrényben előszárításnak kell alávetni 70 °C állandó hőmérsékleten mindaddig, amíg a 15 percen belül mért tömegcsökkenés nem haladja meg az eredeti tömeg 0,3%-át.

**2.3.2.8** A 2.3.2.1 bekezdés szerinti gyengén nitrált nitrocellulózt előzetesen az előző 2.3.2.7 bekezdés szerinti feltételek mellett előszárításnak kell alávetni, ezután azt legalább 15 órán át exszikkátorban koncentrált kénsav fölött kell tartani.

**2.3.2.9 Kémiai állandóság vizsgálata hőhatásra**

a) Az előző 2.3.2.1 bekezdésben felsorolt anyagok vizsgálata:

i) Két kémcső mindegyikébe, amelyeknek

hosszúsága 350 mm,

belső átmérője 16 mm,

falvastagsága 1,5 mm,

kalcium-klorid fölött szárított 1 g anyagot kell tenni (szükség esetén az anyagot szárítás céljából 0,05 g-nyi darabkákra kell aprítani).

A két kémcsövet teljesen, de nem szorosan be kell fedni, ezután úgy kell az elektromos kemencébe helyezni, hogy azok legalább hosszúságuk 4/5 részében láthatók legyenek, és 30 percen át 132 °C állandó hőmérsékletnek legyenek kitéve. Meg kell figyelni, hogy ezen idő alatt képződnek-e sárgásbarna nitrózus gázok, amelyek különösen jól láthatók fehér háttér előtt.

ii) Az anyagot kémiailag állandónak kell tekinteni, ha ilyen gázok nem jelennek meg.

- b) A plasztifikált nitrocellulóz vizsgálata (lásd a 2.3.2.2 bekezdést):
- 3 g plasztifikált nitrocellulózt az a) pontban leírtakhoz hasonló kémcsövekbe teszünk, amelyeket azután 132 °C állandó hőmérsékletű szárítószekrénybe helyezünk.
  - A plasztifikált nitrocellulózt tartalmazó kémcsöveket egy órán át kell a szárítószekrényben tartani. Ezen idő alatt nem szabad, hogy sárgásbarna nitrózus gőzök váljanak láthatóvá. A megfigyelés és értékelés az a) pontban leírtakhoz hasonló.

**2.3.2.10 A gyulladási hőmérséklet vizsgálata (lásd a 2.3.2.1 és a 2.3.2.2 bekezdést)**

- a) A gyulladási hőmérséklet meghatározásához 0,2 g anyagot tartalmazó kémcsövet Wood-fém fürdőbe merítve kell hevíteni. A kémcsövet azután kell a fürdőbe meríteni, miután a fürdő elérte a 100 °C hőmérsékletet, a hőmérsékletet ezután percenként 5 °C-kal kell növelni.
- b) A kémcsöveknek a következő méretűeknek kell lenniük:
- |              |         |
|--------------|---------|
| hosszúság    | 125 mm, |
| belső átmérő | 15 mm,  |
| falvastagság | 0,5 mm. |
- A kémcsöveket 20 mm mélyen kell a fürdőbe meríteni.
- c) A háromszor megismételt kísérlet során minden egyes alkalommal meg kell állapítani, hogy az anyag meggyulladása milyen hőmérsékleten következik be, illetve, hogy lassú vagy gyors égéssel, fellobbanással vagy robbanással.
- d) A három kísérlet során kapott legkisebb hőmérséklet az anyag gyulladási hőmérséklete.

**2.3.3 A 3, a 6.1 és a 8 osztályba tartozó gyúlékony folyékony anyagok vizsgálata**

**2.3.3.1 Vizsgálat a lobbanáspont meghatározásához**

**2.3.3.1.1 A lobbanáspontot a következő típusú készülékek valamelyikével kell meghatározni:**

- Abel;
- Abel-Pensky;
- Tag;
- Pensky-Martens;
- az ISO 3679:1983 vagy az ISO 3680:1983 szabvány szerinti készülék.

**2.3.3.1.2 A festékek, ragasztók és hasonló, oldószer tartalmú viszkózus termékek lobbanáspontjának meghatározására csak viszkózus folyadékok lobbanáspontjának meghatározására alkalmas készülékek és vizsgálati módszerek használhatók, tekintettel a következő szabványokra:**

- az ISO 3679:1983 nemzetközi szabvány;
- az ISO 3680:1983 nemzetközi szabvány;
- az ISO 1523:1983 nemzetközi szabvány;
- a DIN 53213:1978 I. rész német szabvány.

- 2.3.3.1.3** A vizsgálatot vagy egyensúlyi módszerrel vagy nem-egyensúlyi módszerrel lehet végrehajtani.
- 2.3.3.1.4** Az egyensúlyi módszer szerinti eljárásokra lásd:
- a) az ISO 1516:1981 nemzetközi szabványt;
  - b) az ISO 3680:1983 nemzetközi szabványt;
  - c) az ISO 1523:1983 nemzetközi szabványt;
  - d) az ISO 3679:1983 nemzetközi szabványt.
- 2.3.3.1.5** A nem-egyensúlyi módszer szerinti eljárások a következők:
- a) az Abel féle készülék esetén:
    - i) a BS 2000:1995 170. rész brit szabvány;
    - ii) az NF MO7-011:1988 francia szabvány;
    - iii) az NF T66-009:1969 francia szabvány;
  - b) az Abel-Pensky féle készülék esetén:
    - i) a DIN 51755:1974, 1. rész német szabvány (5 °C-tól 65 °C hőmérsékletig);
    - ii) a DIN 51755:1978, 2. rész német szabvány (5 °C alatti hőmérsékleteknél);
    - iii) az NF MO7-036:1984 francia szabvány;
  - c) a Tag készülék esetén: az ASTM D 56:1993 amerikai szabvány;
  - d) a Pensky-Martens készülék esetén:
    - i) az ISO 2719:1988 nemzetközi szabvány;
    - ii) az EN 22719:1994 európai szabvány annak mindenkori nemzeti kiadása formájában (pl. BS 2000, 404 rész / EN 22719);
    - iii) az ASTM D 93:1994 amerikai szabvány;
    - iv) az IP 34:1988 Institute of Petroleum szabvány.
- 2.3.3.1.6** A 2.3.3.1.4 és a 2.3.3.1.5 pontban felsorolt vizsgálati módszereket csak az egyes módszereknél felsorolt lobbanáspont tartományban lehet használni. A használandó módszer kiválasztásánál figyelembe kell venni az anyag és a mintatartó közötti kémiai reakció lehetőségét. A készüléket a biztonsági előírások betartása mellett huzatmentes helyen kell felállítani. Biztonság okáért ajánlatos a szerves peroxidok és az önreaktív anyagok esetén (amelyek „energetikai” anyagoknak minősülnek), valamint a mérgező anyagok esetén olyan módszert választani, amelyhez csekély mintamennyiség – kb. 2 ml – szükséges.
- 2.3.3.1.7** Ha a 2.3.3.1.5 pont szerinti nem-egyensúlyi módszerrel meghatározott lobbanáspont 23 °C ± 2 °C vagy 60 °C ± 2 °C, az eredményt ugyanazon készüléket használva a 2.3.3.1.4 pont szerinti egyensúlyi módszerrel meg kell erősíteni.
- 2.3.3.1.8** A gyúlékony folyadék besorolásakor felmerülő vita esetén a feladó által javasolt besorolást kell elfogadni, ha az illető folyadék lobbanáspontjának ellenőrző vizsgálata során az eredmény nem tér el 2 °C-nál nagyobb mértékben a 2.2.3.1 bekezdésben megadott értéktartároktól (23 °C, illetve 60 °C). Ha 2 °C-nál nagyobb az eltérés, még egy ellenőrző vizsgálatot kell végezni, és az ellenőrző vizsgálatok során kapott legkisebb értéket kell figyelembe venni.

### 2.3.3.2 *Vizsgálat a peroxid-tartalom meghatározására*

Valamely folyadék peroxid-tartalmát a következő vizsgálati eljárással kell megállapítani:

A titrálendő folyadékból  $p$  mennyiséget (kb. 5 g-nyit 0,01 g pontossággal mérve) bele kell önteni egy Erlenmeyer-lombikba, ehhez hozzá kell adni 20 cm<sup>3</sup> ecetsav-anhidridet, és kb. 1 g-nyi porrá tört szilárd kálium-jodidot, ezt összerázva tíz perc eltelte után három perc alatt kb. 60 °C-ra kell hevíteni. Miután öt percen át hűlni hagyták, 25 cm<sup>3</sup> vizet kell hozzáadni. Félórai állás után a szabaddá vált jódot indikátor hozzáadása nélkül 0,1 normál nátrium-tioszulfát oldattal kell titrálni. A teljes elszíntelenedés jelzi a reakció végét. A tioszulfát oldatból szükséges térfogatot  $n$ -nel jelölve (cm<sup>3</sup>-ben), a folyadék peroxid-tartalma (H<sub>2</sub>O<sub>2</sub>-re vetítve) a  $\frac{17n}{100p}$  képletből adódik.

### 2.3.4 *Vizsgálat a folyékonyág meghatározásához*

A folyékony vagy viszkózus anyagok és keverékek, valamint a pasztaszerű anyagok folyékonyágának meghatározására a következő módszert kell alkalmazni:

#### 2.3.4.1 *Vizsgálókészülék*

Kereskedelmi forgalomban kapható, ISO 2137:1985 szabvány szerinti penetrométer 47,5 ± 0,05 g-os vezetőrúddal; kúpos furatokkal ellátott 102,5 ± 0,05 g tömegű duralumíniumból készült szitatárcsával (lásd a 4. ábrát); és a minta befogadására alkalmas, 72...80 mm belső átmérőjű penetrációs tartállyal.

#### 2.3.4.2 *Vizsgálati eljárás*

A mintát legkésőbb fél órával a mérés előtt a penetrációs tartályba öntjük. A tartályt a légmentes lezárás után a mérésig mozdulatlan állapotban kell tartani. A mintát a légmentesen lezárt penetrációs tartályban 35 °C ± 0,5 °C hőmérsékletre felmelegítjük és a penetrométer asztalára helyezzük közvetlenül a mérés előtt (legfeljebb 2 perccel előbb). Ezt követően a szitatárcsa S csúcsát a folyadék felületére helyezzük, és mérjük a behatolás mélységét az idő függvényében.

#### 2.3.4.3 *Az eredmények értékelése*

Az anyag pasztaszerű, ha az S csúcsot a minta felületére helyezve a mérőórán leolvasott behatolás

- a) 5 ± 0,1 s terhelési idő elteltével 15,0 ± 0,3 mm-nél kisebb, vagy
- b) 5 ± 0,1 s terhelési idő elteltével 15,0 ± 0,3 mm-nél nagyobb, de újabb 55 ± 0,5 s idő elteltével a további penetráció 5 ± 0,5 mm-nél kisebb.

**Megjegyzés:** Olyan minta esetében, amelynek folyáspontja van, gyakran nem lehet a penetrációs tartályban állandó szintű felületet létrehozni és ennek következtében nem lehet világosan megállapítani a mérés kezdeti feltételeit az S csúccsal való érintkezésbe hozatalkor. Ezenfelül bizonyos minták esetében a szitatárcsa ráhelyezése a felület rugalmas alakváltozását válthatja ki, ezáltal az első másodpercekben mélyebb behatolás látszatát kelti. Ezekben az esetekben alkalmas lehet az eredmények értékelését az előző b) pont szerint végezni.

4. ábra: Penetrométer

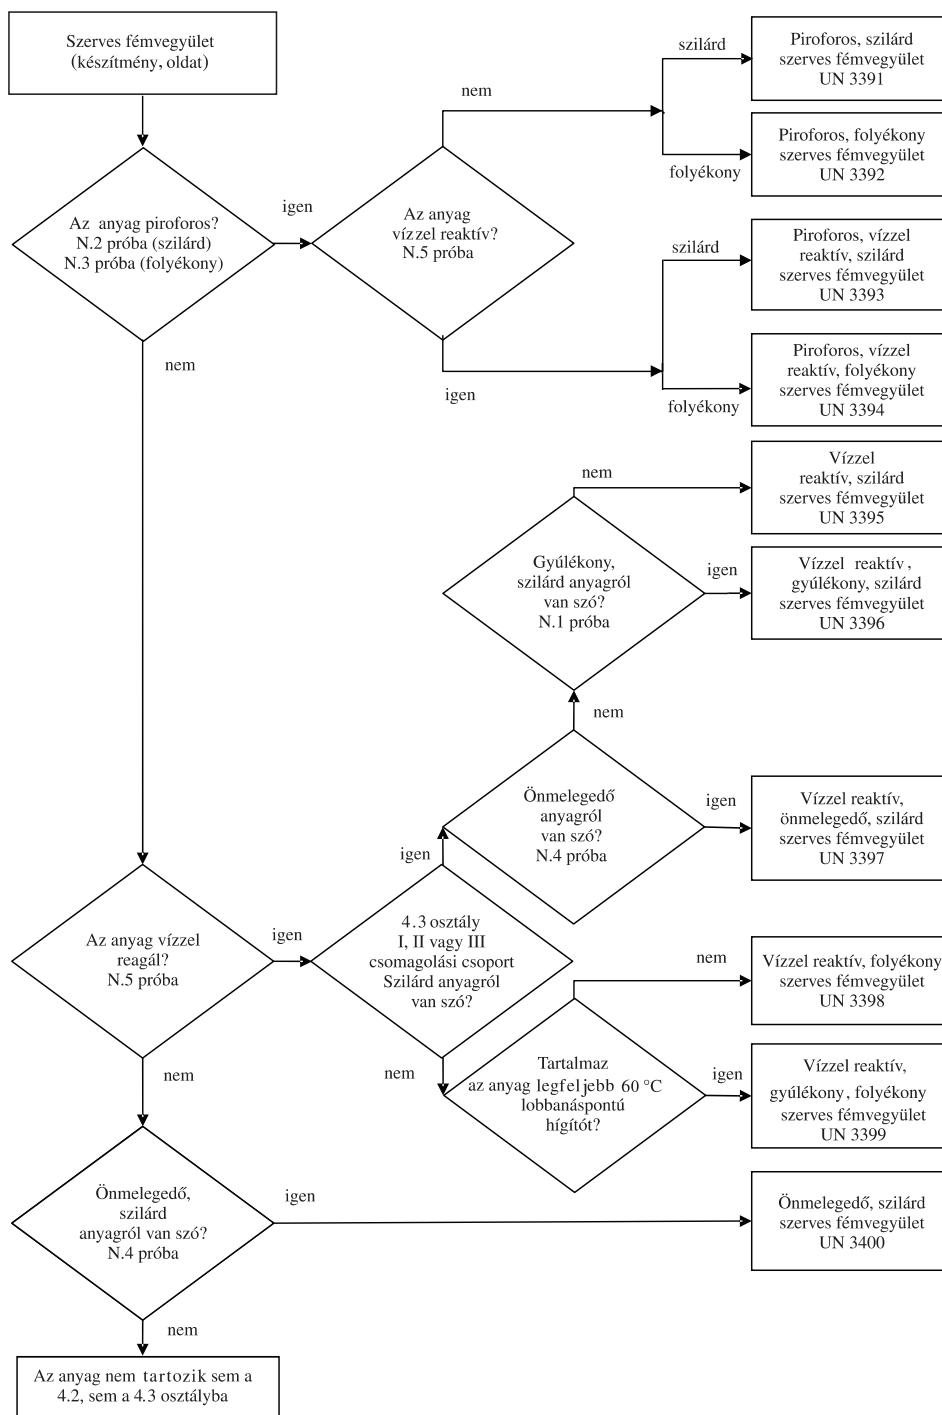

A tűrés nélkül megadott méretek tűrése:  $\pm 0,1$  mm

**2.3.5 A szerves fémvegyületek besorolása a 4.2 és a 4.3 osztályba**

A szerves fémvegyületek a „Vizsgálatok és kritériumok kézikönyv”, III. rész, 33 fejezet N.1 - N.5 vizsgálattal meghatározott tulajdonságaiktól függően a 2.3.5 folyamatábra alapján a 4.2, ill. a 4.3 osztályba sorolhatók.

- Megjegyzés:**
- 1. A járulékos veszélyekkel rendelkező szerves fémvegyületeket tulajdonságaiktól függően a veszélyességi rangsor táblázat (lásd a 2.1.3.10 bekezdést) figyelembe vételével adott esetben esetleg más osztályba kell besorolni.*
  - 2. A szerves fémvegyületeket olyan koncentrációban tartalmazó gyúlékony oldatok, amelyek vízzel érintkezve sem gyúlékony gázokat nem fejlesztenek veszélyes mennyiségben, sem öngyulladásra nem hajlamosak, a 3 osztály anyagai.*

2.3.5 ábra: Folyamatábra a szerves fémvegyületek besorolására a 4.2 és a 4.3 osztályba<sup>a, b)</sup>

a) Ha alkalmazható és a vizsgálat – figyelembe véve az anyag reakcióját – célszerűen végrehajtható, akkor a 6.1, ill. a 8 osztály szerinti tulajdonságokat a 2.1.3.10 bekezdés veszélyességi rangsor táblázata szerint kell számításba venni.

b) Az N.1 - N.5 vizsgálati módszer leírását a „Vizsgálatok és kritériumok kézikönyv”, III. rész, 33. fejezet tartalmazza.

**3. rész**

**A veszélyes áruk felsorolása, különleges előírások és  
a korlátozott és az engedményes mennyiségben  
csomagolt veszélyes árukra vonatkozó mentességek**

### 3.1 fejezet

#### Általános előírások

##### 3.1.1 Bevezetés

Az e rész táblázataiban található vagy hivatkozott előírásokon kívül minden rész, fejezet és / vagy szakasz általános követelményeit is be kell tartani. A táblázatok ezeket az általános követelményeket nem tartalmazzák. Ha egy általános követelmény valamely különleges előírásnak ellentmond, a különleges előírás a mértékadó.

##### 3.1.2 Helyes szállítási megnevezés

*Megjegyzés: Minták szállításánál a helyes szállítási megnevezésre lásd a 2.1.4.1 bekezdést.*

**3.1.2.1** A helyes szállítási megnevezés a 3.2 fejezet „A” táblázatában szereplő, az árut legpontosabban leíró tétel azon része, amely nagybetűvel van szedve (és minden szám, görög betű, „sec”, „terc”, „m”, „n”, „o”, „p” betűk, amelyek a megnevezés szerves részét képezik). A helyes szállítási megnevezés után zárójelben egy másik helyes szállítási megnevezés is lehet [pl. ETANOL (ETIL-ALKOHOL)]. A tétel kisbetűvel szedett része nem tekintendő a helyes szállítási megnevezés részének.

**3.1.2.2** Amennyiben az „és” vagy a „vagy” kötőszavak kisbetűvel vannak írva, vagy ha az egyes megnevezések vesszővel vannak elválasztva, a tétel teljes helyes szállítási megnevezését nem szükséges feltüntetni a fuvarokmányban vagy a küldeménydarab feliratozásánál. Ez különösen akkor áll fenn, ha egyetlen UN szám alatt több különböző tétel kombinációja van felsorolva. Az alábbi példák mutatják az ilyen tételeknél a helyes szállítási megnevezés kiválasztását:

a) UN 1057 ÖNGYÚJTÓK vagy ÖNGYÚJTÓ UTÁNTÖLTŐK

A helyes szállítási megnevezés a következő lehetséges kombinációk közül a legalkalmasabb:

ÖNGYÚJTÓK  
ÖNGYÚJTÓ UTÁNTÖLTŐK;

b) UN 2793 VASTARTALMÚ FORGÁCS FÚRÁSBÓL, KÖSZÖRÜLÉSBŐL, ESZTERGÁLÁSBÓL vagy DARABOLÁSBÓL önmelegedésre hajlamos formában.

A helyes szállítási megnevezés a következő kombinációk közül a legalkalmasabb:

VASTARTALMÚ FORGÁCS FÚRÁSBÓL  
VASTARTALMÚ FORGÁCS KÖSZÖRÜLÉSBŐL  
VASTARTALMÚ FORGÁCS ESZTERGÁLÁSBÓL  
VASTARTALMÚ FORGÁCS DARABOLÁSBÓL.

**3.1.2.3** A helyes szállítási megnevezés lehet egyes számban vagy többes számban, ahogy megfelelő. Ezenkívül amennyiben a helyes szállítási megnevezésben jelzős szerkezet van, a fuvarokmányban és a küldeménydarabok feliratán a szórend – értelemszerűen – megváltoztatható. Például: a „dimetil-amin vizes oldata” helyett „vizes dimetil-amin oldat” is írható. Az 1 osztály áruinál a helyes szállítási megnevezést magában foglaló, további leírással kiegészített kereskedelmi vagy katonai nevek is használhatók.

**3.1.2.4** Számos anyagra külön tétel van folyékony és szilárd állapotban (a folyékony és a szilárd meghatározását lásd az 1.2.1 szakaszban), ill. szilárd állapotban és oldat formájában. Ezek

eltérő UN számok alá tartoznak, amelyek nem feltétlenül egymás után következnek<sup>1)</sup>.

**3.1.2.5** Ha az 1.2.1 szakasz meghatározása szerint szilárd anyagot olvasztott állapotban adnak fel szállításra, akkor a helyes szállítási megnevezést ki kell egészíteni az „OLVASZTOTT” jelzővel, kivéve, ha ez a 3.2 fejezet „A” táblázatában levő megnevezésben nagybetűvel szedve szerepel (pl. OLVASZTOTT, SZILÁRD ALKIL-FENOL, M.N.N.).

**3.1.2.6** Ha a 2.2.x.2 bekezdések szerint egy anyag stabilizálás nélkül a szállításból ki lenne zárva, mivel normális szállítási feltételek mellett veszélyes reakcióra hajlamos, a helyes szállítási megnevezést ki kell egészíteni a „STABILIZÁLT” kifejezéssel (pl.: „SZERVES, MÉRGEZŐ FOLYÉKONY ANYAG, M.N.N., STABILIZÁLT”), kivéve az önreaktív anyagokat, a szerves peroxidokat és azokat az anyagokat, amelyeknél a 3.2 fejezet „A” táblázat 2 oszlopában lévő megnevezésben a „STABILIZÁLT” szó nagybetűvel szedve szerepel.

Ha az ilyen anyagokat hőmérséklet-szabályozással stabilizálják, hogy mindenféle veszélyes túlnyomás kialakulását megakadályozzák, akkor:

- a) folyadékok esetében: a hőmérséklet-szabályozást igénylő anyagok<sup>2)</sup> a vasúti fuvarozásból ki vannak zárva;
- b) gázok esetében: a szállítási feltételeket az illetékes hatóságnak kell jóváhagynia.

**3.1.2.7** A hidrátok a vízmentes anyagra vonatkozó helyes szállítási megnevezés alatt szállíthatók.

**3.1.2.8** *Generikus vagy „másként meg nem nevezett” (m.n.n.) tételek*

**3.1.2.8.1** Azokat az „m.n.n.” vagy „generikus” helyes szállítási megnevezéseket, amelyekhez a 3.2 fejezet „A” táblázat 6 oszlopában a 274 különleges előírás van hozzárendelve, ki kell egészíteni az áru műszaki megnevezésével, kivéve, ha az áru ellenőrzött termék, aminek közzétételét belföldi jogszabály vagy nemzetközi egyezmény tiltja. Az 1 osztály robbanó-anyagai esetében a veszélyes áru megnevezése kiegészíthető további leírással, kereskedelmi vagy katonai névvel. A műszaki megnevezést közvetlenül a helyes szállítási megnevezés után, zárójelben kell feltüntetni. Ezekon kívül a megnevezéshez megfelelő kiegészítő leírás is fűzhető, mint pl. a „tartalmaz”, „tartalmazó”, „keverék”, „oldat” stb. szavak, ill. a technikai alkotórész százalékos aránya is megadható. Például „UN 1993 Gyúlékony folyékony anyag, m.n.n. (xilolt és benzolt tartalmaz), 3, II”.

**3.1.2.8.1.1** A műszaki megnevezés lehet elfogadott kémiai – adott esetben biológiai – megnevezés, vagy a tudományos és műszaki kézikönyvekben, folyóiratokban és egyéb szakirodalomban jelenleg használt, egyéb megnevezés. Kereskedelmi nevek erre a célra nem használhatók. Peszticidek esetén az ISO által elfogadott megnevezés vagy „A WHO ajánlása a peszticidek veszély szerinti osztályozására és az osztályozás irányelvei” („The WHO Recommended Classification of Pesticides by Hazard and Guidelines to Classification”) c. kiadványban felsorolt nevek, illetve a hatóanyagok neve használható.

**3.1.2.8.1.2** Ha egy veszélyes anyago(ka)t tartalmazó keverék olyan „m.n.n.” vagy „generikus” tételhez tartozik, amelynél a 3.2 fejezet „A” táblázat 6 oszlopában a 274 különleges előírás található, nem szükséges két olyan alkotórészről többet megnevezni, amely a keverék veszélyessége tekintetében mérvadó. Ha az áru ellenőrzött termék, aminek közzétételét belföldi jogszabály vagy nemzetközi egyezmény tiltja, nem kell az alkotórészeket megnevezni. Ha a keveréket

1) A részleteket a betűrendes felsorolás tartalmazza (3.2 fejezet „B” táblázat), pl.  
NITRO-XILOLOK, FOLYÉKONY 6.1 1665  
NITRO-XILOLOK, SZILÁRD 6.1 3447

2) Ez a meghatározás kiterjed minden olyan anyagra (beleértve a kémiai inhibitorokkal stabilizált anyagokat is), amelyek öngyorsuló bomlási hőmérséklete (ÖBH-ja) a szállításhoz használt csomagolásban legfeljebb 50 °C.

tartalmazó küldeménydarabon járulékos veszélyre utaló bárca van, a zárójelben levő két műszaki megnevezés egyikével azt az alkotórészt kell megnevezni, amelyik miatt a járulékos veszélyre utaló bárca szükséges.

*Megjegyzés: Lásd az 5.4.1.2.2 pontot.*

- 3.1.2.8.1.3** Az áru műszaki megnevezéssel kiegészített helyes szállítási megnevezésének megválasztását az ilyen tételeknél a következő példák mutatják:

UN 3394 PIROFOROS, VÍZZEL REAKTÍV, FOLYÉKONY, SZERVES FÉMVEGYÜLET  
(trimetil-gallium)

UN 2902 FOLYÉKONY, MÉRGEZŐ PESZTICID, M.N.N. (drazoxolon).

- 3.1.2.9** *Egyetlen veszélyes anyagot tartalmazó keverékek és oldatok*

Ha egy oldatot vagy keveréket a 2.1.3.3 bekezdés osztályozási követelményei szerint ugyanúgy kell tekinteni, mint a név szerint felsorolt veszélyes anyagot, akkor a helyes szállítási megnevezést ki kell egészíteni az „OLDAT” vagy „KEVERÉK” jelzővel, pl. „ACETON OLDAT”. Ezen kívül az oldat vagy a keverék koncentrációja ugyancsak feltüntethető, pl. „75%-os ACETON OLDAT”.

## 3.2 fejezet

### A veszélyes áruk felsorolása

#### 3.2.1

#### Az „A” táblázat (A veszélyes áruk UN szám szerinti felsorolása) magyarázata

Az „A” táblázat egy-egy sora általában valamely konkrét UN szám alá tartozó összes anyagra vagy tárgyra vonatkozik. Ha azonban ugyanazon UN szám alá tartozó anyagok vagy tárgyak eltérő kémiai, fizikai tulajdonságokkal és/vagy szállítási feltételekkel rendelkeznek, az adott UN számra több, egymás utáni sor is vonatkozhat.

Az „A” táblázat oszlopai egy-egy meghatározott tárgykörre vonatkoznak, amint az a következő magyarázatban szerepel. Az oszlopok és sorok metszéspontja (rovat) tartalmazza az adott oszlopban szereplő tárgykört illetően az adott sor anyagára (anyagaira) vagy tárgyára (tárgyaira) vonatkozó információt:

- az első négy oszlop azonosítja az adott sorba tartozó anyago(ka)t vagy tárgya(ka)t (ebben a vonatkozásban kiegészítő információt adhatnak a 6 oszlopban található különleges előírások);
- a következő oszlopok a különleges előírásokat adják meg vagy szöveges, vagy kódolt formában. A kódok az itt következő magyarázatban feltüntetett részben, fejezetben, szakaszban és/vagy bekezdésben található részletes információra utalnak. Ha egy rovat üres, az azt jelenti, hogy vagy nincs különleges előírás és így csak az általános követelményeket kell alkalmazni, vagy a magyarázatban szereplő szállítási korlátozások érvényesek.

A rovatokban nincs utalás az általános követelményekre. Azt, hogy az általános követelmények melyik részben, fejezetben, szakaszban és/vagy bekezdésben találhatók, minden egyes oszlopra a következő magyarázat mutatja.

Magyarázó megjegyzések az egyes oszlopokhoz:

#### 1 oszlop

#### „UN szám”

Itt vannak feltüntetve:

- az egyedi UN számok, amelyek konkrétan egy-egy veszélyes anyaghoz vagy tárgyhöz vannak hozzárendelve, illetve
- a „generikus” vagy „m.n.n.” tételek UN száma, amelyhez a név szerint nem említett veszélyes anyagokat vagy tárgyakat a 2. rész osztályozási kritériumai (a „döntési fák”) szerint hozzá kell rendelni.

#### 2 oszlop

#### „Megnevezés és leírás”

Itt van feltüntetve – nagy betűvel szedve – az egyedi UN számmal rendelkező anyagok vagy tárgyak megnevezése, illetve a „generikus” vagy „m.n.n.” tételek megnevezése, amelyhez az anyagok vagy tárgyak a 2. rész osztályozási kritériumai (a „döntési fák”) szerint hozzá vannak rendelve. Ezt a megnevezést kell helyes szállítási megnevezésként, illetve annak részeként használni (a helyes szállítási megnevezésre vonatkozó további részletekre lásd a 3.1.2 szakaszt).

Ha egy anyag vagy tárgy besorolása és/vagy szállítási feltételei bizonyos körülmények között eltérőek lehetnek, a tétel értelmezéséhez a helyes szállítási megnevezés mellett – kisbetűvel szedve – további leírás is szerepel.

<b>3a oszlop</b>	<b>„Osztály”</b> Itt van feltüntetve az osztály, amelynek fogalomkörébe a veszélyes anyag vagy tárgy tartozik. Az osztály számának hozzárendelése a 2. rész eljárásai és kritériumai szerint történik.
<b>3b oszlop</b>	<b>„Osztályozási kód”</b> Itt van feltüntetve a veszélyes anyag vagy tárgy osztályozási kódja.  Az 1 osztály anyagai és tárgyai esetében a kód a 2.2.1.1.4 pont szerinti eljárások és kritériumok alapján hozzárendelt alosztály számából és összeférhetőségi csoport betűjéből áll.  A 2 osztály anyagai és tárgyai esetében a kód egy számból és a veszélyes tulajdonság szerinti csoport betűjéből (betűiből) áll, amelyek magyarázata a 2.2.2.1.2 és a 2.2.2.1.3 pontban található.  A 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 6.2, 8 és 9 osztály anyagai és tárgyai esetében a kódok magyarázata a 2.2.x.1.2 pontban <sup>3)</sup> található.  A 7 osztály anyagai és tárgyai esetében nincs osztályozási kód.
<b>4 oszlop</b>	<b>„Csomagolási csoport”</b> Itt van feltüntetve az anyaghoz rendelt csomagolási csoport száma (I, II vagy III). A csomagolási csoportok a 2. rész szerinti eljárások és kritériumok alapján vannak hozzárendelve. Bizonyos anyagok és tárgyak nincsenek csomagolási csoporthoz rendelve.
<b>5 oszlop</b>	<b>„Bárcák”</b> Itt van feltüntetve azoknak a bárcáknak, nagybárcáknak a száma (lásd az 5.2.2.2 és az 5.3.1.7 bekezdést), amelyeket a küldeménydarabokon, konténereken, tankkonténereken, mobil tartányokon, MEG-konténereken, tartálykocsikon, leszerelhető tartányos kocsikon, battériás kocsikon és teherkocsikon kell elhelyezni.  A meghatározott anyagoknál zárójelben megadott 13 és 15 számú tolatási bárcát (lásd az 5.3.4 szakaszt) csak a következő esetekben kell elhelyezni: <ul style="list-style-type: none"><li>– 1 osztály esetén: azoknak a kocsiknak mindkét oldalára, amelyekben ezen osztály anyagát kocsirakományként fuvarozzák;</li><li>– 2 osztály esetén: a tartálykocsik, leszerelhető tartányos kocsik és battériás kocsik, valamint tankkonténereket, MEG-konténereket vagy mobil tartányokat fuvarozó kocsik mindkét oldalára.</li></ul> Azonban: <ul style="list-style-type: none"><li>– a 7 osztály anyagai és tárgyai esetében a 7X a kategóriának megfelelően a 7A, 7B vagy 7C számú bárcát (lásd az 5.1.5.3.4 és az 5.2.2.1.11.1 pontot), vagy a 7D számú nagybárcát (lásd az 5.3.1.1.3 és az 5.3.1.7.2 pontot) jelenti.</li></ul> A bárcákra, nagybárcákra vonatkozó általános előírásokat (azaz a bárcák darabszámát, elhelyezésüket) küldeménydarabok és kiskonténerek esetén az 5.2.2.1 bekezdés, nagykonténerek, tankkonténerek, mobil tartányok, MEG-konténerek, tartálykocsik, leszerelhető tartányos kocsik, battériás kocsik és teherkocsik esetében az 5.3.1 szakasz tartalmazza.

3) Ahol x = a veszélyes anyag vagy tárgy osztályának száma, a kétszámjegyű osztályoknál „pont” nélkül.

**Megjegyzés:** A 6 oszlopban található különleges előírások módosíthatják az előző bárcázási előírásokat.

**6 oszlop****„Különleges előírások”**

Itt van feltüntetve a betartandó különleges előírás(ok) száma. Ezek az előírások széles tárgykört fognak át, főleg az 1 – 5 oszlop tartalmához kapcsolódnak (pl. szállítási tilalmak, felmentések a követelmények alól, magyarázatok a veszélyes áruk bizonyos formáinak besorolásához és kiegészítő bárcázási vagy jelölési előírások) és a 3.3 fejezetben szám szerint vannak felsorolva. Ha a 6 oszlop üres, a szóban forgó veszélyes áru esetében az 1 – 5 oszlop tartalmára nem vonatkozik különleges előírás.

**7a oszlop****„Korlátozott mennyiség”**

Itt egy betűkből és számokból álló kód van feltüntetve, amelynek jelentése a következő:

- az „LQ0” azt jelenti, hogy a veszélyes áru korlátozott mennyiségben csomagolva sem mentesül a RID előírásainak hatálya alól;
- minden más „LQ” kód azt jelenti, hogy a RID előírásait nem kell alkalmazni, ha a 3.4 fejezetben előírt feltételek teljesülnek.

**7b oszlop****„Engedményes mennyiség”**

Itt egy betűből és számból álló kód van feltüntetve, amelynek jelentése a következő:

- az „E0” azt jelenti, hogy a veszélyes áru engedményes mennyiségben csomagolva sem mentesül a RID előírásainak hatálya alól;
- minden más „E” kód azt jelenti, hogy a RID előírásait nem kell alkalmazni, ha a 3.5 fejezetben előírt feltételek teljesülnek.

**8 oszlop****„Csomagolási utasítások”**

Itt van feltüntetve az alkalmazandó csomagolási utasítás betűkből és számokból álló kódja:

- „P” betűvel kezdődő kód, amely a csomagolóeszközökre és a tartályokra (kivéve az IBC-ket és a nagycsomagolásokat) vonatkozó csomagolási utasításokra utal, ill. az „R” betűvel kezdődő kód, amely a finomlemez csomagolásokra vonatkozó csomagolási utasításokra utal. Ezek az utasítások a 4.1.4.1 bekezdésben szám szerinti sorrendben vannak feltüntetve, és azt határozzák meg, hogy milyen csomagolóeszközt vagy tartályt lehet használni. Ugyancsak utalnak arra, hogy a 4.1.1, 4.1.2 és 4.1.3 szakasz általános csomagolási előírásai közül és a 4.1.5, 4.1.6, 4.1.7, 4.1.8 és 4.1.9 szakasz különleges csomagolási előírásai közül melyeket kell betartani. Ha a 8 oszlopban nincs „P” vagy „R” betűvel kezdődő kód, a szóban forgó veszélyes áru nem szállítható csomagolóeszközben;
- „IBC” betűkkel kezdődő kód, amely az IBC-kre vonatkozó csomagolási utasításokra utal. Ezek az utasítások a 4.1.4.2 bekezdésben szám szerinti sorrendben vannak feltüntetve, és azt határozzák meg, hogy milyen IBC-t lehet használni. Ugyancsak utalnak arra, hogy a 4.1.1, 4.1.2 és 4.1.3 szakasz általános csomagolási előírásai közül és a 4.1.5, 4.1.6, 4.1.7, 4.1.8 és 4.1.9 szakasz

különleges csomagolási előírásai közül melyeket kell betartani. Ha a 8 oszlopban nincs „IBC” betűvel kezdődő kód, a szóban forgó veszélyes áru nem szállítható IBC-ben;

- „LP” betűvel kezdődő kód, amely a nagycsomagolásokra vonatkozó csomagolási utasításokra utal. Ezek az utasítások a 4.1.4.3 bekezdésben szám szerinti sorrendben vannak feltüntetve, és azt határozzák meg, hogy milyen nagycsomagolást lehet használni. Ugyancsak utalnak arra, hogy a 4.1.1, 4.1.2 és 4.1.3 szakasz általános csomagolási előírásai közül és a 4.1.5, 4.1.6, 4.1.7, 4.1.8 és 4.1.9 szakasz különleges csomagolási előírásai közül melyeket kell betartani. Ha a 8 oszlopban nincs „LP” betűvel kezdődő kód, a szóban forgó veszélyes áru nem szállítható nagycsomagolásban;

**Megjegyzés:** A 9a oszlopban található különleges csomagolási előírások módosíthatják az előző csomagolási utasításokat.

#### 9a oszlop

##### „Különleges csomagolási előírások”

Itt van feltüntetve az alkalmazandó különleges csomagolási előírás betűkből és számokból álló kódja:

- „PP” vagy „RR” betűvel kezdődő kód, amely a csomagolóeszközök és tartályok (kivéve az IBC-eket és nagycsomagolásokat) tekintetében kiegészítésként betartandó különleges csomagolási előírásokra utal. Ezek a különleges csomagolási előírások a 4.1.4.1 bekezdésben találhatók a megfelelő („P” vagy „R” betűvel kezdődő) csomagolási utasítások után, amelyekre a 8 oszlopban található hivatkozás. Ha a 9a oszlopban nincs „PP” vagy „RR” betűvel kezdődő kód, a megfelelő csomagolási utasítás végén felsorolt különleges csomagolási előírások egyikét sem kell alkalmazni;
- „B” betűvel vagy „BB” betűvel kezdődő kód, amely az IBC-k tekintetében kiegészítésként betartandó különleges csomagolási előírásokra utal. Ezek a különleges csomagolási előírások a 4.1.4.2 bekezdésben találhatók a megfelelő („IBC” betűvel kezdődő) csomagolási utasítások után, amelyekre a 8 oszlopban található hivatkozás. Ha a 9a oszlopban nincs „B” betűvel vagy „BB” betűvel kezdődő kód, a megfelelő csomagolási utasítás végén felsorolt különleges csomagolási előírások egyikét sem kell alkalmazni;
- „L” betűvel kezdődő kód, amely a nagycsomagolások tekintetében kiegészítésként betartandó különleges csomagolási előírásokra utal. Ezek a különleges csomagolási előírások a 4.1.4.3 bekezdésben találhatók a megfelelő („LP” betűvel kezdődő) csomagolási utasítások után, amelyekre a 8 oszlopban található hivatkozás. Ha a 9a oszlopban nincs „L” betűvel kezdődő kód, a megfelelő csomagolási utasítás végén felsorolt különleges csomagolási előírások egyikét sem kell alkalmazni.

#### 9b oszlop

##### „Egybecsomagolási előírások”

Itt van feltüntetve az alkalmazandó egybecsomagolási előírás „MP” betűvel kezdődő kódja. Ezek az előírások szám szerinti sorrendben a 4.1.10 szakaszban vannak feltüntetve. Ha a 9b oszlop nem tartalmaz „MP” betűvel kezdődő kódot, csak az általános követelményeket kell betartani (lásd a 4.1.1.5 és a 4.1.1.6 bekezdést).

**10 oszlop****„Mobil tartány és ömlesztettáru-konténer utasítások”**

Itt van feltüntetve a „mobil tartány utasítás” betűkből és számokból álló kódja, a 4.2.5.2.1 – 4.2.5.2.4 és a 4.2.5.2.6 pont szerint. Itt az a mobil tartány utasítás szerepel, amely a legkevésbé szigorú előírásokat takarja, amelyek betartásával az illető anyag mobil tartányban szállítható. A 4.2.5.2.5 pontban vannak azok a kódok, amelyek a többi mobil tartány utasítást jelölik, amelyek szerint az anyag ugyancsak szállítható. Ha nincs kód megadva, akkor a mobil tartányban történő szállítás nem engedélyezett, kivéve, ha azt az illetékes hatóság a 6.7.1.3 bekezdés szerint engedélyezte.

A mobil tartányok tervezésére, gyártására, szerelvényeire, típus-jóváhagyására, vizsgálatára és jelölésére vonatkozó általános követelményeket a 6.7 fejezet tartalmazza. A használatra (pl. a töltésre) vonatkozó általános követelmények a 4.2.1 – 4.2.4 szakaszban találhatók.

Az „(M)” jelölés azt jelenti, hogy az anyag UN MEG-konténerben is szállítható.

***Megjegyzés:** A 11 oszlopban található különleges előírások módosítják az előző követelményeket.*

Itt lehetnek feltüntetve a „BK” betűkkel kezdődő kódok is, amelyek a 6.11 fejezetben leírt ömlesztettáru-konténer típusokra utalnak, amelyeket a 7.3.1.1 a) pont és a 7.3.2 szakasz előírásai szerint lehet ömlesztett áru szállítására használni.

**11 oszlop****„Különleges előírások a mobil tartányokra és az ömlesztettáru-konténerekre”**

Itt van feltüntetve a mobil tartányokra vonatkozó, ugyancsak betartandó különleges előírások betűkből és számokból álló kódja. Ezek a „TP” betűkkel kezdődő kódok a mobil tartányok gyártására és használatára vonatkozó különleges előírásokra utalnak, és a 4.2.5.3 bekezdésben találhatók.

***Megjegyzés:** Az itt feltüntetett különleges előírások nemcsak a 10 oszlopban előírt mobil tartányokra vonatkoznak, hanem – amennyiben műszakilag értelmezhető – azokra a mobil tartányokra is, amelyek a 4.2.5.2.5 pont táblázata szerint szintén használhatók.*

**12 oszlop****„RID-tartány tartánycódja”**

Itt van feltüntetve a tartány típust leíró, betűkből és számokból álló kód a 2 osztály gázaira a 4.3.3.1.1 pont szerint, a 3 – 9 osztály anyagaira a 4.3.4.1.1 pont szerint. Itt az a tartány típus szerepel, amely a legkevésbé szigorú előírásokat takarja, amelyek betartásával az illető anyag RID-tartányban szállítható. A 2 osztály gázaira a 4.3.3.1.2 pontban, a 3 – 9 osztály anyagaira a 4.3.4.1.2 pontban vannak azok a kódok, amelyek a többi tartány típust jelölik, amelyekben az anyag ugyancsak szállítható. Ha nincs kód megadva, a RID-tartányban történő szállítás nem engedélyezett.

Amennyiben ebben az oszlopban szilárd anyagra (S) és folyékony anyagra (L) vonatkozó tartánycód is található, ez azt jelenti, hogy az anyag szilárd vagy folyékony (olvasztott) állapotban egyaránt feladható tartányban való szállításra. Ez az előírás általában a 20 °C...180 °C közötti olvadáspontú

anyagokra vonatkozik.

Ha egy szilárd anyagnál csak folyékony anyagra vonatkozó tartánykód (L) van ebben az oszlopban feltüntetve, akkor ez az anyag tartányban csak folyékony (olvasztott) állapotban adható fel szállításra.

A gyártásra, szerelvényekre, típusjóváhagyásra, vizsgálatra és jelölésre vonatkozó általános követelmények, amelyeket a tartánykód nem tartalmaz, a 6.8.1, 6.8.2, 6.8.3 és 6.8.5 szakaszban találhatók. A használatra (pl. legnagyobb töltési fokra, legkisebb próbanyomásra) vonatkozó általános követelmények a 4.3.1 – 4.3.4 szakaszban találhatók.

A tartánykód utáni „(M)” jelölés azt jelenti, hogy az anyag battériás kocsiban és MEG-konténerben is szállítható.

A tartánykód utáni „(+)” jelölés azt jelenti, hogy a tartány alternatív használata csak akkor megengedett, ha ez a típusjóváhagyási bizonyítványban szerepel.

A szálvázaz műanyag tankkonténerekre lásd a 4.4.1 szakaszt és a 6.9 fejezetet; a hulladékok szállítására szolgáló, vákuummal üzemelő tartányokra lásd a 4.5.1 szakaszt és a 6.10 fejezetet.

**Megjegyzés:** A 13 oszlopban található különleges előírások módosítják az előző követelményeket.

#### 13 oszlop

#### „Különleges előírások a RID-tartányokra”

Itt vannak feltüntetve a RID-tartányokra vonatkozó, ugyancsak betartandó különleges előírások betűkből és számokból álló kódjai:

- a „TU” betűkkel kezdődő kódok a tartányok használatára vonatkozó különleges előírásokra utalnak, és a 4.3.5 szakaszban találhatók;
- a „TC” betűkkel kezdődő kódok a tartányok gyártására vonatkozó különleges előírásokra utalnak, és a 6.8.4 a) bekezdésben találhatók;
- a „TE” betűkkel kezdődő kódok a tartányok szerelvényeire vonatkozó különleges előírásokra utalnak, és a 6.8.4 b) bekezdésben találhatók;
- a „TA” betűkkel kezdődő kódok a tartányok típusjóváhagyására vonatkozó különleges előírásokra utalnak, és a 6.8.4 c) bekezdésben találhatók;
- a „TT” betűkkel kezdődő kódok a tartányok vizsgálatára vonatkozó különleges előírásokra utalnak, és a 6.8.4 d) bekezdésben találhatók;
- a „TM” betűkkel kezdődő kódok a tartányok jelölésére vonatkozó különleges előírásokra utalnak, és a 6.8.4 e) bekezdésben találhatók.

**Megjegyzés:** Az itt feltüntetett különleges előírások nemcsak a 12 oszlopban előírt tartányokra vonatkoznak, hanem – amennyiben műszakilag értelmezhető – azokra a tartányokra is, amelyek a 4.3.3.1.2, ill. a 4.3.4.1.2 pontban lévő tartányrangsor alapján szintén használhatók.

#### 14 oszlop

(fenntartva)

#### 15 oszlop

#### „Szállítási kategória”

Itt van feltüntetve a szállítási kategóriát jelölő szám, amelyhez az anyag vagy tárgy hozzá van rendelve a vállalatok (vállalkozások) fő

tevékenységével kapcsolatos szállításokból adódó mentesség alkalmazásához (lásd az 1.1.3.1 c) pontot).

**16 oszlop****„Különleges előírások a küldeménydarabok fuvarozására”**

Itt vannak feltüntetve a „W” betűből és számokból álló kódok, amelyek a küldeménydarabok fuvarozására vonatkozó, esetleges különleges előírásokra utalnak, és a 7.2.4 szakaszban vannak felsorolva. A küldeménydarabok fuvarozására vonatkozó általános előírásokat a 7.1 és a 7.2 fejezet tartalmazza.

*Megjegyzés: Ezen kívül a berakásra, kirakásra és árukezelésre vonatkozó, a 18 oszlopban található különleges előírásokat is be kell tartani.*

**17 oszlop****„Különleges előírások az ömlesztett fuvarozásra”**

Itt vannak feltüntetve a „VW” betűkből és számokból álló kódok, amelyek az ömlesztett fuvarozásra vonatkozó különleges előírásokra utalnak, és a 7.3.3 szakaszban vannak felsorolva. Ha nincs kód megadva, az ömlesztett fuvarozás nem engedélyezett. Az ömlesztett fuvarozásra vonatkozó általános előírásokat a 7.1 és a 7.3 fejezet tartalmazza.

*Megjegyzés: Ezen kívül a berakásra, kirakásra és árukezelésre vonatkozó, a 18 oszlopban található különleges előírásokat is be kell tartani.*

**18 oszlop****„Különleges előírások a fuvarozásra – Berakás, kirakás és árukezelés”**

Itt vannak feltüntetve a „CW” betűkből és számokból álló kódok, amelyek a berakásra, kirakásra és árukezelésre vonatkozó különleges előírásokra utalnak, és a 7.5.11 szakaszban vannak felsorolva. Ha nincs kód megadva, csak az általános követelményeket kell betartani (lásd a 7.5.1 – 7.5.4 és a 7.5.8 szakaszt).

**19 oszlop****„Expresszáru”**

Itt vannak feltüntetve a „CE” betűkből és számokból álló kódok, amelyek az expresszáruként történő fuvarozásra vonatkozó különleges előírásokra utalnak, és a 7.6 fejezetben vannak felsorolva. Ha nincs kód megadva, az expresszáruként történő fuvarozás nem engedélyezett.

**20 oszlop****„Veszélyt jelölő szám”**

Itt van feltüntetve a veszélyt jelölő szám, amely a 2 – 9 osztály anyagai és tárgyai esetén két vagy három számjegyből (egy esetben előtte egy „X” betűből) álló szám, az 1 osztály anyagai és tárgyai esetén az osztályozási kód (lásd a 3b oszlopot). Ezt a számot kell az 5.3.2.1 bekezdés szerinti esetekben a narancssárga tábla felső részén feltüntetni. A veszélyt jelölő számok jelentése az 5.3.2.3 bekezdésben található.

### 3.2.2 „B” táblázat: A veszélyes áruk betűrendes felsorolása

Az anyagok és tárgyak neve abc sorrendben van feltüntetve. Az arab számok és az előtagok, mint „o-”, „m-”, „p-”, „n-”, „szek-”, „terc-”, „N-”, „alfa-”, „béta-”, „omega-”, „cisz-”, „transz-” nincsenek figyelembe véve. A „bisz-” és „izo-” előtagok azonban az abc szerinti sorrendnél figyelembe vannak véve.

„NHM kód” (Nomenclature Harmonisée Marchandises – Harmonizált árucikkjegyzék)

Ebben az oszlopban az árunak a Harmonizált Árucikkjegyzék (UIC 221. sz. Döntvény 3. melléklete) szerinti NHM pozíciószáma van megadva. Mivel a veszélyes árukhoz az NHM pozíciószámok olyan alapelvek szerint vannak hozzárendelve, amelyek a RID besorolási eljárásától eltérőek, ezért nem mindig lehet a RID anyagmegnevezéshez egyetlen NHM pozíciószámot hozzárendelni. Ez különösen érvényes a gyűjtőmegnevezésekre és az m.n.n. tételekre. Ezekben az esetekben a helyes NHM pozíciószám csak akkor található meg, ha az áru kémiai vagy műszaki megnevezése ismert. Ha a helyes NHM pozíciószám nem adható meg teljes egészében, a hiányzó számok helyén plusz („+”) jelek állnak. Azokban az esetekben, amikor egy anyaghoz több NHM pozíciószám vehető számításba, az oszlopban két alkalmas NHM pozíciószám található ahol is az első helyen szereplő szám a gyakrabban alkalmazhatót jelöli.

Az OTIF Titkársága az NHM kódhoz való hozzárendelést a lehető legnagyobb gondossággal végzi, ennek ellenére nem garantálható, hogy a tartalmi és a technikai részletek között nem akad hiba.

Az NHM kódot tartalmazó oszlop nem része a jogszabálynak.
